Moreover, gender-based violence in both the public (workforce) and private spheres (domestic) has resulted in millions of lost workdays. This is illustrated by a 2003 study, which reported that almost 8 million days of paid work in the United States could be directly or indirectly related to intimate partner violence (Gerberding et al. 2003). Thus, gender-based violence is a large enough problem that it actually exerts a negative effect on a country's gross domestic product (GDP) due to the significant public health problem it creates and the high costs to the healthcare system that result from it. Women who have been victims of gender-based violence often experience barriers to economic participation as a result of the physical effects of violence, which include chronic pain, joint and mobility problems, gastrointestinal conditions, and blood pressure/hypertension problems. Perhaps more debilitating are the devastating mental health effects that result from the accrued trauma of gender-based violence. Such mental health effects could include depression, anxiety, posttraumatic stress disorder, sleep disturbances, suicidal tendencies, and addictive behaviors.

Gender-based violence is not exclusive to the private realm of the family and/or community. Workplaces are also sites of discrimination against women, and this discrimination can

range from the disparity between men and women in positions of power – which helps perpetuate the gender pay gap and other power imbalances – to serious cases of abuse in the form of either sexual harassment or physical violence in the workplace. As a high proportion of working age women have begun to participate in the labor forces of democratic societies, governments have also had to assume a critical role in developing solutions to these complex workplace issues, including protective legislation aimed at eliminating sexual harassment, male aggressions, and violence in employment situations.

Furthermore, not all employment situations improve women's economic status, as women in most economies of the world are frequently over-represented among workers earning poverty-level wages. This empirical observation was termed the "feminization of poverty" by Diana Pearce in the 1970s and is viewed as another social mechanism that is used to subjugate women to men, consequently exacerbating the problem of gender-based violence. A labor market structure that confines women to low-paying peripheral jobs or as non-participants in the labor force renders them financially vulnerable and economically dependent on a partner, and this lack of viable economic options makes them susceptible to repeated episodes of violence because they lack the resources to leave an abusive relationship. Commonly, abusive male partners in family violence situations will use tactics of control to actively interfere with their partner's ability to pursue an education or gainful employment, which constitutes a form of depriving a woman of her economic rights and entitlements. In other instances where a woman is employed, her abuser may deny her access to money, which could include her own earnings or other family assets.

One method of reducing women's exposure to such abuses is to develop preventive measures that provide young women with opportunities for economic self-sufficiency through education and living wage employment. The problem of the continual undermining of girls by state-led policies that deny them an education in a safe and healthy public school environment is especially

prevalent in low income regions throughout the world, and this problem represents yet another form of female discrimination that ultimately increases these girls' susceptibility to violence. In these societies, more resources need to be allocated to educating girls and promoting their participation in high tier employment in the formal workforce. In the developing world, the International Labour Organization, trade unions, and other workers' groups are also taking action to pressure employers to develop policies and standards that protect workers from gender-based abuses in the workplace.

## Concluding Remarks

In sum, gender-based abuses permeate all aspects of life in all societal contexts; they can be observed in the US President Donald Trump's misogynistic comments about women, the chilling issue of Missing and Murdered Indigenous Women and Girls (MMIW) in Canada, and the human trafficking and sexual exploitation of women and girls in many countries, both rich and poor, throughout the global community. Although improvements to the available supports for women and girls are being made as global culture becomes less tolerant of violence against women, progress remains slow in ensuring that all women have a right to a life that is devoid of violence.

## Gender-Responsive Budgeting

Zohra Khan

Policy Advisor, Governance & National Planning, UN-Women, New York, NY, USA

### Synonyms

Budgeting, Feminist analysis

### Introduction

Gender-responsive budgeting is a mainstreaming strategy to integrate gender equality objectives into fiscal policy and administration. It allows fiscal authorities to structure tax and spending policies to eliminate gender gaps and promote equality. It is not a separate budget for women, or specific spending on women's programs, but rather an analysis of the whole budget to assess its impact on women and men. It does this by applying a gender analysis to government policies, plans, and programs to improve the allocation of resources to gender-specific objectives.

Gender-responsive budgeting emerged out of feminist analysis of macroeconomics in the

1980s with Australia pioneering the first-ever Women's Budget Program in 1984. It grew in popularity following the Fourth World Conference on Women in Beijing in 1995. The outcome of this landmark conference, the *Beijing Declaration and Platform for Action*, called on governments to "[integrate] a gender perspective in budgetary decisions on policies and programs, as well as [ensure] the adequate financing of specific programmes for securing equality between women and men" (UN 1995). This sparked international interest with many countries adopting gender-responsive budgeting as a concrete way to link gender policy objectives to resources.

These early initiatives were supported by several international organizations including the Commonwealth Secretariat, the United Nations Development Fund for Women (UNIFEM), and the Organization for Economic Co-operation and Development (OECD). In 1995, the Commonwealth Secretariat launched its Gender Budget Initiative with pilot programs in Barbados, Fiji, South Africa, and Australia (Budlender and Hewitt 2003). In 2001, the United Nations Development Fund for Women (UNIFEM) launched a gender-responsive budget program in 20 countries.<sup>1</sup> These initiatives played an important role in building knowledge, developing capacity of budget actors, supporting policy dialogue with governments and civil society actors, and strengthening systems and budgeting processes. They also laid the ground for a more systematic uptake of gender-responsive budgeting across the world.

Today more than 100 countries have implemented some form of gender-responsive budgeting. These experiences may be found in both developed and developing economies and span a wide range of goals including, among others, increasing women's access to health, education, and employment, ending violence against women, and advancing economic empowerment.

---

<sup>1</sup>Peru, Ecuador, Bolivia, Brazil, Chile, Belize, Mexico, Nigeria, Senegal, Mozambique, Tanzania, Uganda, Kenya, Philippines, Sri Lanka, India, Nepal, Afghanistan, Morocco, Egypt

This entry draws on select country experiences and highlights the salient features of gender-responsive budgeting, identifies gaps in knowledge, and highlights areas for further scholarly investigation, analysis, and advocacy. It concludes that gender-responsive budgeting can only be effective if embedded in a feminist macroeconomic framework.

## Why the Budget?

As key policy instruments, budgets are important because they determine how governments mobilize and spend public resources (Heyzer 2002). They also have effects on the economy and can narrow or widen gender gaps through impacts on employment, inflation, and growth (Elson 2006). Budgets are often considered gender neutral, yet the choices governments make on how to mobilize and allocate resources impact women and men differently due to their roles and responsibilities in households, communities, and societies. Budgets also reflect the social and economic priorities of a country and can therefore reinforce, maintain, or reduce gender inequality (Elson 2011). For example, a government may choose to spend on national defense rather than early childhood care which would impact women more than men as they provide most of the unpaid care work.

Gender-responsive budgeting also makes visible the “blind spots” of mainstream macroeconomic policy by drawing attention to issues of care work and women’s role within the productive and reproductive economy (Budlender et al. 1998). It sheds light on deficiencies in public spending and introduces deliberate measures in budgeting systems to ensure a more equitable distribution of resources. By redirecting resources, governments can make strategic investments, toward women’s health or education, training and skills building or providing greater access to high-quality public services to advance gender equality goals. Well-designed gender budgets can enhance women’s security and rights and have positive impacts on society and the economy. Conversely, budget cuts often have a disproportionate impact on women as

they are more reliant on state provided public services than men.

Governments often claim that there are insufficient resources, or lack fiscal space, to make the required investments for gender equality. However, feminist economists have challenged this notion. Seguino (2017), for example, makes a case for viewing gender expenditure as an “investment” rather than an “expense” because it builds social and human capital that contributes to long-term and sustainable economic growth. Citing evidence from Tanzania, Fontana and Natali 2008 in Seguino S (2017) argue that targeted investments in infrastructure reduced the time women spent on care work and raised women’s income by 17.7%, relative to economy-wide average incomes. Feminists have also used human rights instruments to make the case for increased resources for gender equality. Under the *International Covenant on Economic, Social and Cultural Rights (ICESCR)*, states must “devote the maximum available resources to fulfil their obligations, ensure the progressive realization of rights and must avoid deliberately regressive measures” (Elson 2006). This means that governments are obliged to create fiscal space to generate resources to address women’s needs and achieve their gender equality goals.

## How Does Gender-Responsive Budgeting Work?

Implementation of gender-responsive budgeting varies in nature and scope owing to its evolution over time and depending on the political context, entry points for engagement, and the level of capacity in country (Sharp and Elson, 2007). While there is no single, universal model, all countries typically follow a four-phase budget cycle<sup>2</sup> allowing for the use of common tools and approaches. Over the past two decades, international organizations and feminist economists have

<sup>2</sup>These include (1) budget preparation, (2) approval, (3) execution, and (4) evaluation and audit.

developed a multitude of tools<sup>3</sup> that provide entry points across the preparation, execution, audit, and evaluation stages of the budget, while governments have adapted these tools to their national contexts.

Some countries, like Morocco and Mozambique, have integrated gender-responsive budgeting into their finance laws, so it is part of the legislative framework governing the budget. Others, like Ecuador and Nepal, have developed markers to classify gender-related expenditure, while others, like Korea and Austria, have developed tracking systems to monitor allocations across the budget cycle. Many countries have achieved significant results across all these domains. These experiences have identified some features of gender-responsive budgeting worth exploring. These include the need for strong legal requirements and guidelines; ongoing capacity strengthening of budget actors; availability of high-quality sex-disaggregated data; and the active participation of stakeholders, inside and outside of government.

### Laws and Guidelines

Integrating gender objectives into budget laws and guidelines supports political uptake of gender-responsive budgeting. In Albania, the Ministry of Finance and Economy integrated gender into its budget law and included gender-responsive budgeting in the Public Finance Management Strategy. The Ministry issued specific guidelines to sectors on mainstreaming gender into program budgets, including a directive to include at least one gender-related objective in their medium-term budget program. During the fiscal year 2015–2016, there was an increase in total gender budget allocations from USD\$37 million to

USD\$63.4 million, representing 1.73% of the total budget. Several countries in Latin America and the Caribbean have included gender-responsive budgeting in secondary laws mandating ministries to bring gender analysis into planning, budgeting, and allocations (Toledo 2013). In 2006, Bolivia added an article to the Ministry of Finance regulations requiring that municipal governments allocate public funds to improve gender equality. Over 4 years, the budget allocations for gender equality, made by 36 local governments, increased from USD\$384,885 to USD\$23,879,989 (Coello and Wretblad 2012). Similarly, Mexico City mandated the earmarking of public funds for 40 institutional activities aimed to improve gender equality; resource allocations increased by 9.4% from USD95m in 2008 to USD104m in 2010 (Ministry of Finance 2013). The existence of laws and guideline mandates ministries to make concrete adjustments in budget systems to ensure compliance. Several OECD countries, like Austria, Iceland, Spain, and Korea, have legal foundations for gender budgeting (OECD 2017). These are important to insulate gender-responsive budgeting efforts from economic and political change.

### Capacity Strengthening

Strengthening the capacity of budget actors, through skills and knowledge transfer, is critical. A key component of effective capacity strengthening is ensuring that budget actors can undertake good gender analysis and have the tools and knowledge to design and implement program interventions. Several countries like Morocco, Uganda, Rwanda, and Nepal have engaged in long-term capacity development through the establishment of learning centers, the development of tools and training materials, and partnerships with academic institutions. Morocco established a center of excellence on gender budgeting, within the Ministry of Economy and Finance, in 2013 with a focus on research and innovation, training, and South-South exchange among countries in the region. The Russian Academy of Public Administration established a regional gender-responsive budgeting center of excellence in 2012 to build capacity of civil servants at all levels of state governance through

<sup>3</sup> See Diane Elson's 7 tools: (1) gender-aware policy appraisal, (2) gender-disaggregated beneficiary assessment, (3) gender-disaggregated public expenditure incidence analysis, (4) gender-disaggregated analysis of the impact of the budget on time use, (5) gender-aware medium-term economic policy frameworks, (6) gender-aware budget statements, and (7) disaggregated tax incidence analysis; Rhonda Sharp's 3-way categorization of gender expenditure; Debbie Budlender, 5 steps of gender budgeting; and OECD's 10 tools.

programs and courses on gender-responsive fiscal policy and budgeting. In Mozambique, the Centre for Gender Studies and Coordination at the Eduardo Mondlane University hosts a center of excellence with a well-developed curriculum which includes courses on gender and public policies, gender and the economy, and gender-responsive planning and budgeting. The Higher Institute of Public Administration conducts the specialized course for staff in the Ministry of Finance, Economy and Planning, and civil servants are expected to take the training at least once in their public service careers.

Another important capacity development strategy is the deployment of technical experts to ministries of finance. This approach ensures rapid and tailored technical guidance throughout the annual budget cycle. Some countries have established interactive help desks to support staff with tools and guidance. International organizations like UN Women, the United Nations Development Programme (UNDP), United Nations Population Fund (UNFPA), and the OECD have also contributed to capacity development through the provision of high-quality training products and programs. A key challenge to institutionalizing capacity within government ministries however is the attitudes and perception of public servants who are sometimes resistant to gender equality. For capacity to transform into applied knowledge and skill, it must have the highest level of political support and incentives for change.

### Data

Good planning and budgeting requires good data. From a budgeting perspective, the absence of high-quality sex-disaggregated data significantly hampers the effectiveness of gender-responsive budgeting. Such data is critical to identify gender gaps, design policies and programs, and assess the impact of these. Ministries and national statistical offices often lack the knowledge, skills, and know-how to generate and use sex-disaggregated data. However, there is significant investment in building national capacities to generate and use high-quality data. In Mexico, the National Institute of Statistics and Geography (INEGI) has a

database of comprehensive sex-disaggregated data, including at the household level, to support planning and budgeting. INEGI has positioned itself as a center of excellence on gender data. In addition, countries like Albania, Ecuador, and Mexico provide detailed breakdowns of their gender allocations and make budget data publicly available. In Ecuador, the Ministry of Finance developed a public online budget execution tracking system that aims to provide the most comprehensive inventory of gender projects and budget allocations. The Global Initiative for Fiscal Transparency (GIFT) recently developed an Open Budget Data Package, which facilitates analysis of the national budget by making all data available in an open format and allows users to view and create corresponding visualizations on sector-specific spending.<sup>4</sup> The availability of open and transparent data is a feature of good public finance management.

### Multi-stakeholder Engagement

Some of the most successful examples of gender-responsive budgeting are those that involve multiple actors. Multi-stakeholder mechanisms, such as gender budgeting committees or gender working groups, are critical for strengthening coordination across ministries and can facilitate the engagement of civil society, including parliamentarians. In Rwanda, the Gender Monitoring Office, mandated to oversee implementation of the national gender policy, collaborates with all stakeholders to assess implementation of gender-responsive budgeting across sectors. In Nepal, a gender-responsive budgeting committee, including the Ministry of Finance and sector ministries, coordinates actions across government ministries. In Serbia, a coalition of government, parliament, and women's organizations collaborated to advance gender-responsive budgeting resulting in the inclusion of gender equality in the budget objectives and programs of 47 government institutions.

<sup>4</sup> Global Initiative for Fiscal Transparency (GIFT) website: <http://www.fiscaltransparency.net/blog/>

Civil society actors are critical drivers of gender budgeting. Many initiatives worldwide have been spearheaded by civil society organizations. These organizations often have direct insight into the challenges women experience and are key interlocutors between government and citizens. In addition to strengthening the demand side for gender budgeting, these organizations also provide technical support and capacity building to ministries of finance. The Tanzania Gender Networking Programme has a long history of engagement with the Ministry of Finance and Economy. This inside/outside strategy has been effective in pushing ministries forward and opening space for greater national and grassroots civil society dialogue and influence. This is particularly important to ensure that local policies and budgets are designed and implemented in ways that respond to women's priorities. In Honduras, UN Women supported training of a regional network of women and municipal representatives on gender equality social audits of municipal budgets and on integrating gender into local plans. These efforts led to the creation of a local committee that conducted social audits and used the results to advocate for more gender-responsive planning and budgeting with their local governments. Gender-responsive budgeting must be supported by institutions such as parliament and audit bodies. These provide oversight and ensure that resources are allocated and spent in line with agreed commitments. Sometimes a lack of capacity among civil society actors, lack of transparency on public finances, and soft audit mechanisms can weaken gender budgeting efforts.

### Gaps in Knowledge and Practice

There is some indication that gender-responsive budgeting contributes to improved outcomes for women. In general, countries with gender budgeting have made more progress on the Gender Development Index, a measure of overall gender equality, than those without. In Morocco, gender-responsive budgeting is associated with an 18% increase in female primary school enrolment in rural areas over 10 years (IMF 2016). In India, states with gender budgeting were found to

have higher girl primary school enrolment rates compared to states without (Stotsky et al. 2016). Data from Rwanda indicates that the country outperformed its peers in reducing maternal mortality rates from 1990 to 2013 after an increase in health expenditure as a share of GDP (Kadama et al. 2018). Despite these positive examples, there is still a lack of quantitative analysis to establish the links between gender-responsive budgeting and improved gender outcomes. Research is needed to assess how investments in areas like education, infrastructure, health, and unpaid care work result in improvements in gender equality. Using household data and econometrics modeling, UN Women and the International Monetary Fund (IMF) are embarking on a research project to fill this gap in knowledge. Further academic research, including longitudinal studies that track incremental changes in budget allocations over time, is warranted.

While gender-responsive budgets may have well-defined goals and processes, they may still fail in execution. Analyzing planned allocations against actual expenditures can provide insight into why gender equality is not improving in countries even with strong gender-responsive budgeting systems. UN Women's research (2017) identified a lack of coordination between ministries and lack of capacity to design and implement programs to address women's needs across their lifecycles. It identified the need to develop good indicators, guided by a national gender plan, to track progress toward outcomes. To address this gap, UN Women, UNDP, and the OECD developed an international standard on gender-responsive budgeting which measures the proportion of countries with systems to track and make public allocations for gender equality and women's empowerment. The indicator measures three important components of a gender-responsive public finance system: (1) intent of a government to address gender equality by identifying whether policies, programs, and resources are in place, (2) existence of system to track resource allocations toward these policy goals, and (3) existence of mechanisms to make data on resource allocations available to the public. By tracking resource allocations, governments will be able to monitor progress toward

achieving their gender policy objectives such as eliminating gender-based violence or increasing women's employment. By making this information public, governments commit to higher levels of transparency and accountability in budget decision-making. Much more qualitative research is needed to assess whether there are other factors that limit progress toward gender equality including social norms and stereotypes that budget systems will not be able to capture.

## Conclusion

This entry provides insights into gender-responsive budgeting based on two decades of technical work. It showcases examples of good practice and highlights areas for further investigation and research. Gender-responsive budgeting emerged out of feminist activisms and pedagogy and has taken root in government systems with the development of laws, systematized knowledge, and capacity. In this way, it strengthens governance by bringing issues of inequality into the heart of the budget process. Yet for gender budgeting to be truly transformative, it must be embedded in its feminist roots and understand that the budget is both a technical and political process. Gender-responsive budgeting will only deliver for women if it is supported by a progressive, and feminist, macroeconomic policy framework. In the context of austerity and shrinking budgets, gender-responsive budgeting provides governments with tools to target resources more effectively and spend more efficiently to advance national gender equality goals. These efforts should be buttressed by the active engagement of women and women's organizations in budget processes. This is a feature of good, transparent, and open governments essential for gender-responsive budgeting to thrive.

## Genomics and Related Sciences: Values and Ethics

Gisèle Yasmeen

Institute of Asian Research, University of British Columbia, Vancouver, BC, Canada

School of Environment and Sustainability, Royal Roads University, Victoria, BC, Canada

### Synonyms

Bioethics; Responsible Research and Innovation; Science and society; Technology assessment

### Definition

Questions around values and ethics with respect to the life sciences in general and genomics in particular are some of the most controversial of our time. With the “God-like” ability to understand and manipulate the code of life itself, normative dimensions of new and emerging technologies provoke debates around the appropriateness of certain technological applications, their potential for misuse, privacy issues, and the potential for the resurgence in eugenics. The ethical, environmental, economic, legal, and social aspects of genomics and related life sciences and technologies is known as ELSI (Environmental, Legal, and Social *Implications*) and ELSA (Environmental, Legal and Social *Aspects*) in the United States and Europe, respectively, and as GE<sup>3</sup>LS in Canada (Genomics: ethical, environmental, economic, legal and social implications).

### Overview

The origin of ELSI, ELSA, and GE<sup>3</sup>LS research dates to 1988 in the beginning of the Human Genome Project (HGP) in USA when the first director of the project, James Watson, announced that part of the project’s budget should be devoted to examining societal implications (Zwart and Nelis 2009, 540). This resulted in a growth of interest from around the world across disciplines embedded within genomics research projects related to the HGP and its spinoffs (Kosseim and Chapman 2011). Implications of genomics for the plant and animal kingdoms have also become matters of interest, particularly given controversies surrounding genetic modification, particularly of food (Smyth et al. 2014). ELSI and related approaches have also expanded to the broader life sciences, and other fields (ref). For example, the Zvi Meitar Institute for Legal Implications of Emerging Technologies, opened in Israel in November 2014, uses the ELSI approach to study a broad range of scientific and technological issues:

Current and future areas of focus include but are not limited to artificial intelligence, next-generation genomic sequencing, autonomous vehicles and smart transportation systems, emerging assisted reproductive technologies, renewable energy sources, the ‘quantified-self’ movement, mobile medical applications, synthetic biology, personalized medicine, 3D printing, telemedicine, epigenetics, citizen science, personal genomics, cloud computing, human enhancement, cryptocurrencies, the Internet of Things, virtual reality, precision farming and genetically modified organisms. (Greenbaum 2015, 425–426)

However, in terms of “classic” ELSI/A approaches to the study of genomics, whether focused on diagnostic tools and/or engineering/modification, Zwart and Nelis (2009) identify four distinguishing features: proximity to the science and technology, early anticipation of possible issues, interaction across sectors (private, public, not-for-profit, as well as academic), and interdisciplinarity. Furthermore, as the impact of the way early investments in genomics were structured around the world, GE<sup>3</sup>LS research has typically been integrated within large-scale research

projects dominated by scientists and engineers conducting the research or developing the technology at the level of various laboratories. Hence, the question of the pros and cons of such an integrated approach have been examined by many scholars (Kosseim and Chapman 2011). For example, a frequent concern is that ELSA genomics has become the “handmaiden” of genomics (Zwart and Nelis 2009, 543) and can lose that critical distance to raise important issues and concerns resulting in a “public relations” exercise. Others have suggested that bioethics in general tends to be weak on the underlying science, reinforcing already entrenched misunderstandings or, conversely, that those in the ELSI field tend to be scientists with little or no background in social science (Greenbaum 2015, 425). As Kosseim and Chapman observe:

Social science and humanities (SSH) research projects, which have traditionally been funded through separate streams and viewed as necessarily external and distant critics of science, are becoming increasingly integrated into large-scale science projects and/or programs. While these are fields of scholarly research in their own right, they tend, in their integrated form, to be more specific in their examination of new technologies, their practical applications, and their implications for society. (Kosseim and Chapman 2011, 197.)

Greenbaum (2015, 426) remarks that fiction and film (and perhaps video games as well) play a double-edged role, in that they sometimes create misunderstandings about science and technology while also inspiring young people to take an interest in these topics.

Finally, in addition to going beyond genomics to inform approaches to critically studying science and technology in general, the experiences gained through ELSA/I scholarship have been related to the broader question of Responsible Research and Innovation (RRI). This is in many ways due to the commitment to RRI within large-scale European Union framework program investments, the most recent being Horizon 2020 (Forsberg 2015). The billions of Euros involved are sure to have a broad influence not only on ELSI/A but also on larger questions of the social responsibility of the research enterprise itself.

## Values and Ethics Debates Within Genomics and Life Sciences

Over the past 40 years, the rapidity with which DNA can be sequenced and the lowering of costs associated with the development of related technologies has resulted in an explosion of mapping of genes for plants, animals, fungi, and yeasts, as well as humans. Furthermore, the ability to edit and manipulate the genome of various species has also grown exponentially, commonly known as genetic engineering.

Issues of ethics and values – not to mention how they play out legally, socially, and economically – map out in various ways in this rapidly evolving field. In terms of genome sequencing itself, the information gleaned can influence the breeding of plants and animals, influence the prediction and management of certain diseases, and be used for various research and community purposes such as archeological and genealogical projects. However, when it comes to the human genome, concerns have been raised about privacy, who owns the intellectual property and for what various purposes the information can and might be used. The concern regarding eugenics and “designer babies” by many, including minorities and people with disabilities, (Suter 2007) brings to the fore a host of ethical and regulatory issues, though some scholars see this as unnecessarily alarmist and not based on available evidence (Caulfield et al. 2013).

In terms of genetic engineering, sometimes resulting in the creation of genetically modified organisms (GMOs), it is important to keep in mind that human beings domesticated and therefore began to exercise control over the breeding of plants and animals more than 10,000 years and – through conventional methods – have already altered the genome of many species. However, genetic engineering allows for faster more aggressive modifications using various new techniques. Genetically modified corn, soybeans, salmon, and apples are some of the most well-known examples of GMOs. Controversies have emerged regarding possible impacts on other – including wild – species, labeling, and consumer’s rights to know and

intellectual property (though conventionally bred plants and animals are also frequently patented). Genetic engineering can accelerate what can be done through conventional breeding but it can also result in “transgenic” gene combinations that would never be possible without newly emerged biotechnologies. Examples include the introduction of spider genes in goats resulting in high strength fibers that can be extracted from the doe’s milk or fish genes in tomatoes, which have been described as the unofficial emblem of the anti-GMO movement though they never made it to market. The Cartagena Protocol on Biosafety developed in 2003 was intended to mitigate related risks associated with GMOs.

## Conclusion

The life sciences in general and genomics in particular are fields that are moving quickly and having impacts on all aspects of our lives. While science and industry tend to resist regulatory interventions, it is incumbent on society at large to reflect on the ramifications of such emerging technologies now and in the future without unduly stifling scientific enquiry and commerce. Science and technology are never value-free and both scholarly and lay attention to ethical and related social, legal, and economic considerations are essential. While being evidence-based is a *sine qua non*, it is important to also question what kind of and whose evidence is referenced, what the conflicts of interest are or might be, and bear in mind the precautionary principle.

<sup>2</sup>ICHEC Brussels Management School, Brussels, Belgium

## Synonyms

Paradoxes; Practice; Socially responsible investment; Tensions

## Introduction

Socially responsible investment (hereafter SRI) can be defined as the integration of environmental, social, and governance issues into investment decisions (Sparkes 2002; Waddock 2003). Although SRI goes by many names and forms, it is characterized by three common features: a long-term perspective, attention to stakeholders, and consideration of nonfinancial factors. For SRI

investors, market signals alone cannot address many of the intangible values that are important for sustainable societies.

SRI attempts to blur the boundaries between financial and nonfinancial values. It can therefore be described as a hybrid activity, which brings together “multiple and inconsistent goals, norms, and values, creating contradictory prescriptions of actions” (Besharov and Smith 2014). The practice of SRI is a fertile ground for paradoxes resulting from competing demands, leading to tensions and ethical dilemmas.

As a result, its practice can be difficult. Bringing together the short and long term; measuring nonfinancial criteria; including or excluding a company; engaging with companies and stakeholders; defining criteria; and all the while producing competitive returns for investors are complex tasks for which there are no simple answers.

In this chapter, we focus on the tensions asset managers (or any other actors of the SRI field) may face because of the complex nature of SRI and how to get by them. We first present the different practices of SRI and then consider the tensions managers face each time illustrated with concrete cases, to finally discuss ways of dealing with those tensions.

The Practice of SRI

SRI covers a variety of practices (Louche and Lydenberg 2011). Company screening and

engagement are the two main approaches, often combined.

Screening refers to the use of criteria to evaluate a company’s performance on environmental, social, and governance issues or/and its involvement in certain activities and behaviors regarded as irresponsible. We can distinguish three ways screens are used: negative or exclusionary screens, positive or inclusionary screens, and best-in-class or relative screens.

Negative screens are avoidance strategies, shunning investments in companies engaged in businesses or practices regarded as unacceptable or generally harmful to society. The most widely used negative screens are tobacco, alcohol, landmines, and violation of human rights.

Positive screens aim at encouraging corporations to enter sustainable lines of business or to develop strong stakeholder relations. With this strategy, investors select companies engaged in business areas or practices they view as exceptionally beneficial to society or stakeholders. Examples of positive screens are renewable energy, pollution control, or public transportation.

Best-in-class screens select sector leaders on environmental, social, and governance criteria. They usually employ a substantial number of ESG criteria to score companies, rank them, and then select the best-performing one (e.g., top 10%) in each industry. The number of ESG criteria used varies greatly (from as few as one or two per industry to more than 200), with some widely used ESG criteria for best-in-class screening, shown in Table 1. ESG criteria tend to evolve

Getting by Tensions in Responsible Investment, Table 1 Examples of environmental, social, and governance issues (extracted from Louche and Lydenberg (2011))

| Environmental (E)                | Social (S)                  | Governance (G)                 |
|----------------------------------|-----------------------------|--------------------------------|
| Emissions                        | Stakeholder relations       | Board structure                |
| Environmental policies           | Working conditions          | Independent directors          |
| Environmental management systems | Respect for human rights    | Independent leadership         |
| Toxic chemicals                  | Diversity                   | Separation of chairman and CEO |
| Genetic engineering              | Workplace health and safety | Remuneration                   |
| Pollution                        | HIV/AIDS                    | Shareholder rights             |
| Water                            | Product safety              | Accounting quality             |
| Energy efficiency                | Treatment of customers      | Audit quality                  |
| Hazardous and solid waste        | Labor relations             | Board skills                   |

over time as new challenges, such as stranded assets or obesity, emerge.

The second approach, company engagement, is motivated by a desire to change corporate behavior toward sustainable practices. By engaging, investors voice their concerns on social, environmental, and governance issues. The three primary modes of SRI engagement are proxy voting, the filing of shareholder resolutions, and direct dialogue with corporations.

## The Paradoxical Tensions of SRI

SRI confronts asset managers with complex issues and tensions. It confronts them with situations in which they need to simultaneously address multiple desirable but conflicting outcomes, such as financial return and societal impact, that operate at different time frames – long term versus short term – and follow different logics. Those paradoxes should not be neglected. Although difficult to get by, they are also the distinctiveness of SRI.

We present below four major paradoxes embedded in the practice of SRI. This list is not meant to be exhaustive but illustrative. However, we first need to specify two notions, dilemma and paradox, which are commonly used as synonyms in everyday language but which involve different actions.

A *dilemma* refers to a situation in which a choice has to be made between two or more alternatives. Resolving a dilemma requires an either/or trade-off involving weighing pros and cons and addressing the contradictory elements separately (Luscher and Lewis 2008).

A *paradox* refers to “contradictory yet interrelated elements that exist simultaneously and persist over time” (Smith and Lewis 2011). In paradox thinking contrary to dilemma thinking, the contradictory elements are not separate but interwoven. As a result, no choice can resolve the tension because opposing solutions are needed. In this perspective, reflexive questioning (Tomm 1987) becomes essential to examine deeper implications and their consequences and

therefore leads to a higher level of abstraction. This enables double-loop learning (Argyris 1993) as actors not only question their current understanding but also their way of thinking. In other words, the paradoxical way of thinking – viewing tensions as complementary and interwoven – encourages managers to develop new, creative alternatives to the challenges they encounter.

## Acceptable Versus Unacceptable

How can SRI investors, whether asset managers or asset owners, define what is an acceptable or unacceptable activity, business, or behavior? Although SRI is a financial product that has to follow certain procedures and criteria to objectivize decisions, the ethical dimension cannot be and should not be excluded. The most recent developments of SRI, through the process of mainstreaming, tend to neglect or ignore this question. The change of name from ethical finance to ESG investing characterizes this shift.

The fact that “ethics” tends to disappear from the vocabulary does not make it irrelevant. We would even argue that it is even more important. Accepting the ethical dimension is also recognizing that the paradoxical tensions cannot be addressed with a cost-benefit analysis. The notion of ethics is central as it raises the question of what SRI is about. The exclusion of ethics emphasizes a unidimensional activity, disconnected from societal debates, while the inclusion of ethics reflects the interconnection between SRI and society/people and the multidimensionality and dynamic interests of SRI that is taking responsibility for a greater common good (Louche and Hebb 2014).

### You are a SRI asset manager. . .

**What to exclude and on what “ethical” grounds?** . . . So far you have only used the best-in-class approach. Your CEO sends you a memo asking to consider divesting from manufacturers of landmines and weapons of mass destruction including nuclear weapons because it is an ‘unacceptable business.’ On what grounds is it ‘unacceptable’? Should you also exclude uranium mining companies, nuclear power companies, and tobacco companies as well? (Adapted from Louche and Lydenberg 2011)

### Can ESG criteria refer to universal values?

. . . Your CEO has asked you to develop a new SRI

product that can be rolled out by your banking divisions around the world. After presenting the product in a meeting with colleagues from different regions of the world, your Middle East colleagues tell you that they could never sell the product unless all financial services companies are eliminated because the Qur'an forbids usury; your Asian colleagues say that the fund's requirement that women be represented on boards would result in excluding all Japanese companies; and your colleagues from South Africa point out that job creation and black empowerment are two issues that mattered greatly, both politically and financially, and need to be included. How will you manage to build a standardized product? (Adapted from Louche and Lydenberg 2011)

### Assessing Companies

A challenge for many investors considering SRI is how to assess the ESG performance of companies. ESG reporting is improving but still incomplete and far from standardized. Different frameworks exist, proposing lists of indicators per sector for a fundamental analysis of companies. While these lists of indicators are helpful, they contain some of the paradoxes of SRI: ESG data is selectively available in a subjective way, so investors combine subjective judgment and objective measures of ESG performance. ESG performance data is less available than ESG exposure data (reported as the existence of a health and safety policy or being a signatory of an ESG initiative), which are proxies that investors will often use to assess the ESG performance of companies.

#### **You are an ESG analyst. . .**

**How to assess companies in case of lack of publicly available information?** . . . You must review the ESG records of 20 European companies in the food industry. Ten of them are large and well-known companies, with well-developed CSR reports. Activities and controversies related to those companies are well covered in the press. The other ten are smaller companies with no CSR information available, and the companies did not appear in your press search. After contacting directly those last ten companies, you learn that some of them do have CSR programs but do not report publicly about them. Moreover, you know from informal sources that one of these companies has taken a very innovative CSR approach recently. How can you compare the 20 companies? (Adapted from Louche and Lydenberg 2011)

### Conflicting Logics

Two issues are related to this third paradox: the measure of societal returns and the different time perspectives between financial and societal returns.

SRI investors need not only account for the financial returns of their investments but also for the social and environmental benefits that their investments have provided. This is a difficult task. If sophisticated tools for reporting financial impacts exist, little has been done on the ESG impacts. It is far more difficult to quantify, measure, and report ESG value created by SRI. One complication comes from the fact that ESG returns take into account the interest of multiple stakeholders – employees, customers, suppliers, communities – in addition to investors. It is not immediately obvious how to calculate it; still it is important to do it.

The second aspect is related to time perspective. There is a persistent tension in SRI between the aspiration to adopt a long-term sustainable view and the business reality of investors and companies who need to meet quarterly results and provide annual returns. This tension appears when SRI investors want to estimate future growth, as time is relative, and framed differently in each sector: how far in the future is “long term” for the technology industry, and how does this compare to “long term” in the utility industry?

Some may wonder if there is a trade-off to be done between financial and societal value. Many studies have investigated this link (Margolis et al. 2009) concluding that there is no proof that SRI funds underperform conventional funds.

#### **You are a SRI asset manager. . .**

**Is there a dichotomy between financial and societal returns?** . . . You work at a major bank. Some of the board members are concerned about environmental issues. They want you to divest from airlines to railways because it is a more energy-efficient mode of transportation. But financial returns from railways are lower than from airlines. After explaining to the board that divesting from airlines may hurt the portfolio's short-term financial performance, they ask you whether there is an equivalent ‘societal’ return from investing in railways to compensate for the poorer financial performance. How are you going to answer this question about societal returns? What is most important for

the competitiveness of the bank? (Adapted from Louche and Lydenberg 2011)

**You are an ESG analyst. . .**

**How far in the future is “long-term”?** You are an ESG analyst specialized in the technology sector. You plan to apply a best-in-class screen in favor of renewable energy. Your company rightly points out that renewable energy is not financially interesting today. However, you consider that the positive externalities of renewable energy have value as well, and you defend your choice as positioning for future growth in this industry. This will make sense depending on the profile of your fund’s clients whose investment horizon will be short-term or long-term. But how long-term should their long-term be to benefit from this investment?

### Engaging with Companies: Between Voice and Exit

One of the keys to engagement is communication as a means of influencing corporate behavior. When talking about engagement, we often refer to the use of dialogue which can be private (behind closed doors) or public, through meeting with the management or by filing a shareholder resolution. Through dialogue, investors express their concerns to the company and develop a shared discourse frame with the company, which facilitates successful engagement. This dialogue form of engagement refers to what Hirschman (1970) calls “voice.” But following Hirschman’s theory, investors actually have another option to raise their concerns: “exit.” It is often referred to as the ‘Wall Street Walk’ and means the sale of shares. If ‘voice’ is ‘messy’ and implies the articulation of one’s critical opinions, ‘exit’ is more straightforward, impersonal, and indirect. Should SRI investors use the ‘voice’ or ‘exit’ approach to exert pressure on the company to change? Actually, it is not an either/or question. It is best to consider the dynamic between both strategies, as shown by Goodman et al. (Goodman et al. 2014). One may start with engaging in a private dialogue with a company, but in cases where there is a lack of responsiveness or inappropriate level of change, the exit approach might be envisaged.

A second aspect of engagement is whether to do it individually or collectively. Building trust between investors and companies on ESG issues

can be difficult and long. Using collective engagement means involving other stakeholders including not just other investors but also NGOs, which may put this trust at risk. But acting collectively can be, in certain cases, much more powerful and impactful. Here again comes the question: when to act individually or collectively, both can be complementary.

**You are a SRI asset manager. . .**

**When to keep the dialogue private and when to become confrontational through public engagement?** . . . You have a private discussion

with a large garment company with operations in China about its labor standards for its subcontractors. Discussions have been friendly and open but have not lead to much progress. You are approached by other investors to join a public campaign. You are tempted to join because you believe the company should be moving faster. However, by doing that, you will most probably lose the company’s trust and the possibility to have confidential talks with the company. Will harsh public criticism relayed by the press be more effective than behind-the-scenes discussion? What can be gained and lost by joining the public campaign? (Adapted from Louche and Lydenberg 2011)

### How to Deal with Paradoxes

As illustrated in the previous section, SRI is full of paradoxes. What does it mean for SRI asset managers or analysts? They have to get by them, working through the paradoxes, and embrace them rather than eliminating or resolving them since they are part of SRI’s nature. To do so, they have to manage a constant back and forth between the different logics present in SRI, thinking paradoxically in terms of “or/and.” They have to engage in social interaction, collaborating with other investors or with frameworks of ESG factors. All of this requires time, to make sense of the paradoxes and determine an appropriate course of action, etc., and taking the time is not something that fast-paced finance is accustomed to. Is also requires specific capabilities, which SRI teams might look for in their recruits, including acceptance of tensions and paradoxical thinking. Fig. 1 summarizes the four competencies we have just highlighted to deal with paradoxes in SRI.

# Getting by Tensions in Responsible Investment,

**Fig. 1** Competencies to deal with paradoxes in SRI

## Conclusion

To conclude, practicing SRI requires combining multiple dimensions: financial returns, ethical considerations, and sustainability principles. Since 2010, SRI has entered into a mainstreaming era with the inclusion of ESG criteria in institutional investor's decision process (Dumas and Louche 2016). If SRI was once a niche activity, it has become a widespread practice among mainstream asset managers. In this wave of mainstreaming, the design of new tools to address contradictory requirements has become essential and vital. These tools need to be more systematic so that SRI does not come as an afterthought; they may rely on ESG ratings; they might adjust cash flows or discount rate in valuation models, to give more weight to the long term. Whatever the type of solution thought up, it is essential that it embraces the tensions of SRI by addressing these multiple logics. Indeed, if the financial logic dominates, all other dimensions or if mainstreaming means fitting ESG into conventional evaluation instruments, SRI will lose its essence and its specificity.

## Ghost, Guest, and Gift Authorship

Charon A. Pierson  
Committee on Publication Ethics,  
Gilbert, AZ, USA

### Synonyms

Co-authorship; Ghostwriting; Gratuitous author; Honorary author; Unacknowledged authorship; Unearned authorship

### Definition

The COPE discussion document on authorship states, “At a minimum, authors should guarantee that they have done the work as presented and that they have not violated any other author’s legal rights (e.g., copyright) in the process” (COPE Council 2014). Ghost, guest, and gift authorships violate that basic tenet. Ghost authors are individuals who have actually made substantial contributions to the writing of a manuscript, but they are not listed as an author. Professional writers hired to write an article for another individual or group but are not listed as authors or contributors are called ghost authors. People who write essays for hire for student purchase are also ghost writers. Guest authors are added to papers, with or without their knowledge, by another author in an attempt to attach greater prestige or importance to the work or to flatter a senior author. A guest author has no connection to the work underlying the paper. The gift author is someone peripherally related to the work, such as a department head or student supervisor, but who does not actually meet the criteria for authorship. Gift authorship may be an expectation of supervisors

in some environments. Taking credit for authorship without doing the work or assuming responsibility for authorship is considered fraudulent and unethical behavior.

### What Are the Issues?

Multiple studies have described the prevalence of ghost, guest, and gift authorship in the medical literature from 5% to as high as 60%, varying with type of article (research or review) and journal guidelines. Based on authorship criteria established by the International Council of Medical Journal Editors (ICMJE 2018), to be considered an author, one must meet these four criteria: (1) make substantial contributions to the conception or design of the work or the acquisition, analysis, or interpretation of the work; (2) draft or critically revise the work for important intellectual content; (3) give final approval for the work submitted; and (4) agree to be accountable for all aspects of the work. Criterion number four is frequently criticized as being unrealistic, but accountability for the entirety of the work is essential to ensure that questions about the integrity of the work are investigated and resolved. Criterion four also excludes professional medical writers from legitimately claiming authorship on medical research and may contribute to high rates of gift or guest authors in some cases. Students and academics often face ethical dilemmas with requests for gift or guest authorship. Co-authorship and collaborations among multiple disciplines presents even greater challenges when collaborators are highly specialized in certain fields, for example, statistics. Unearned authorship credit contributes to a degradation of ethical norms among those who abuse it as well as reputational damage that may not be forgotten or overlooked.

*Ghost authors.* Ghostwriting for celebrity books is a thriving business as evidenced by a quick Google search. Prices vary based on whether the ghostwriter’s name is on the cover (“with” or “as told to”) along with the putative author. Advertisements offer free and easy consultation, but little transparency as to whether a ghost writer would write a scholarly publication

for submission to a journal. To get help writing a scholarly article, researchers and companies hire professional medical writers through a medical communications company. Professional medical writers have been active for many years in developing a code of conduct under which they will work (AMWA-EMWA-ISMP 2017). A key requirement for authors working with professional medical writers is to provide intellectual content and assure access to all the relevant study data and protocols. It is the responsibility of the professional writer to help organize and format the content to the appropriate journal guidelines and to assure all the relevant information is included and conveyed in a fair and ethical manner. Professional writers should be included as an author if they meet the criteria for authorship, or they should be acknowledged, along with any outside funding sources, for full transparency. Ghost writing for student essays and term papers is also a lucrative writing prospect with many online companies offering steady income for good writers.

*Guest authors.* The fact that adding a well-know person to a manuscript prior to submission is not likely to increase the chance of acceptance does not decrease the practice. There may be several reasons for that. Junior authors and students eager to enhance their academic progress or job prospects may be willing to believe there is a secret to success of high-profile careers. Anxiety or lack of confidence in their untested abilities could also contribute. Yet another factor can be an intention to flatter a senior person who could provide a reference or mentoring for future job advancement. A guest author who has no knowledge of the paper would not be able to guarantee the validity of the paper should questions be raised. If misconduct is discovered on a paper, guest authors can suffer reputational harm. Several cases have been brought to the COPE Forum (<https://publicationethics.org/cases>) when authors who were listed on a published manuscript at the time misconduct was discovered requested to have their names removed because they did not actually qualify as authors.

*Gift authors.* The issue of gift or honorary authors is more complex. It may be that some individuals who make essential contributions to

the project do not qualify as authors under the strict guidelines of the ICMJE authorship criteria. One initiative that tries to account for a variety of author and contributor roles is CRediT (<https://casrai.org/credit/>), the Contributor and Researcher Taxonomy. An example of one of the CRediT roles is the category of software. A case could be made for an individual who wrote highly specialized code for research that was grounded in the underlying theory driving the research to be considered an author, especially if that code were a part of the manuscript. The CRediT initiative encourages all roles be captured and listed on the final manuscript, facilitating complete transparency about the research endeavor. It is also difficult to determine the degree of influence of a supervisor or mentor on the development of a paper, and the decision to include that individual should be made jointly with the primary author. What should not occur is a mandate that all papers out of a laboratory or a department include the name of the chair or head regardless of input. Each case must be considered on its own merits.

## Gift-Giving and Foundation-Owned Business

Liv Egholm

Department of Management, Politics and Philosophy, Copenhagen Business School, Frederiksberg, Denmark

### Synonyms

Company philanthropy; Industrial foundations; Philanthropic industries

### Introduction

Current literature, discussions, and theoretical analyses of gift-giving practices owe a deep debt to the French anthropologist Marcel Mauss. Gift-giving is defined through the relationship between a giver, a gift, and a receiver based on the essential rules that regulate gift-giving; a gift has to be given, received, and reciprocated (Mauss 1990). These practices create social bonds and debts, which hold such relations together. Mauss emphasized that gift-giving is a total social entity (Mauss 1990, p. 7) – in other words, a phenomenon whose specific design plays a central part in defining and organizing society at large (Mauss 1990, p. 5).

### Gift-Giving and Reciprocity

Mauss' definition of gift-giving and the gift is unique in that it acknowledges the complexity and apparent contradictions of the practice; the gift is free and voluntary, but it calls for reciprocity at the same time. Emphasizing the principle of reciprocity, the phenomenon suggests that not only altruism but also power, definitions, and potential destruction are in play when a gift is given, received, and returned – potentially causing frustration, resentment, and insult (Bourdieu 1987; Silber 2012). Consequently, the Maussian gift-giving concept transgresses the unnecessary

dichotomy between the functionalistic and the utilitarian perspective by characterizing the gift-giving relation as voluntary and obligatory *and* disinterested and interested at the same time (Egholm 2020).

Highlighting the principles of reciprocity in gift-giving has opened up critical questions: What are the characteristics of gift-giving? Moreover, linked to this, what are the consequences of gift-giving reciprocity? Such questions are relevant when studying philanthropic gift-giving and its role vis-à-vis state, market, and civil society. Studying philanthropy and mainly the role played by foundation-owned businesses provides an exemplary entry to identify the reciprocal relations between state, market, and civil society and enables us to trace the processes that organize and legitimize the mutually constitutive relationship between citizenship, democracy, and solidarity in the specific communities (Egholm 2021).

In the field of gift-giving and philanthropic endeavors, social rights are often at the center of battles over who should receive the gifts. This battlefield includes municipalities, state legislation, religious movements, state provision, philanthropic and voluntary organizations, and the recipients of poor relief – all intertwined, which impacts state legalization and its consequences for inclusion and exclusion of groups of citizens (Egholm 2020).

### Philanthropic Gift-Giving and Foundation-Owned Businesses

Foundation-owned companies are created by the founder of the company with the intention to both secure the companies prosperity by avoiding dividing the company between potential heirs, the wish to engage in society by contributing to “the common good” (Egholm 2021), and as a branding exercise. Foundation-owned businesses are often strong multinational companies, combining for-profit production with founder-defined philanthropy and nonprofit ownership. They are particularly interesting as philanthropic enterprises, as they distribute self-generated wealth.

Their revenue and, thus, donation capacity tend to grow over time, and aside from tax laws (which seldom change), they are only subject to the foundation's charter and the company's success. Foundation-owned companies were common in the USA before they were effectively prohibited by the Tax Reform Act of 1969, which was not reversed before 2018. They are common in Northern Europe (e.g., Bertelsmann, Heineken, Ikea, and Robert Bosch) and particularly numerous in Denmark where they include prominent international companies (e.g., Møller-Maersk; Carlsberg, Novo Nordisk and William Demant) (Hansmann and Thomsen 2021).

### Philanthropic Practices and Welfare Societies

Although philanthropic organizations traditionally are placed within civil society in the sector model (Cohen and Arato 1992), the philanthropy of foundation-owned businesses naturally cross-cut the traditional divide between state, market, and civil society. Consequently (especially if the foundations have been in operation for a while and/or have a significant donation record), they can be expected to have a remarkable impact on society's organizing and legitimizing principles, pointing to future avenues for the common good.

Typically, philanthropic and voluntary associations are believed to amend poorly or badly functioning welfare states and safeguard the common good. A strong welfare state, then, would not need philanthropic associations. However, in the Nordic welfare societies, philanthropic gift-giving has been an active player in developing the welfare state since the outset. It has even seen significant progress in recent years, both as a growing financial contribution to society and a partnership with the welfare state. Foundation-owned business' practices of philanthropic investment have had and still have an essential effect on defining what is "common" and what is "good" in changing historical settings (Lichterhan and Eliasoph 2014). The definition of the "common good" in society is carefully interwoven with the current moral order of a society. It regulates which

categories of groups are included in or excluded from society, and by which terms of behaviors (Clemens 2010) and values (Alexander 2006). The reciprocal relationships between citizenship, democracy, solidarity, and the common good have thus always been a significant political battlefield. Throughout time, philanthropic practices and, thus, Foundation-owned businesses have played an essential part in this battle.

### Conclusion

Emphasizing the philanthropic gift-giving practices of especially foundation-owned business is of essence to understand the intertwined relationship between state, market, and civil society, especially in defining the "common good" of a society over time. Foundation-owned businesses have played a significant role in the continuous development of both US governmental practices and the Nordic welfare states. The legislation in place has both provided space for and restricted the growth of how foundation-owned businesses contribute to the definition of society "common good" and thus influence the processes that organize and legitimize the mutually constitutive relationship between citizenship, democracy, and solidarity in society.

## Gifting and Influence in the Private Sector

Kemi Ogunyemi

Lagos, Nigeria

### Synonyms

Conflict of interest; Influence peddling; Private-to-private corruption; Questionable payments

### Introduction

The offer of gifts is a common practice among individuals and corporations, due to its many benefits. Human beings give things to one another to express love, gratitude, appreciation, understanding, sympathy, friendship, and so on. There are welcome gifts, farewell gifts, “thank you” gifts, anniversary gifts, corporate gifts, etc. A gift ordinarily brings happiness to both giver and recipient

and creates a closer bond between them. Chong and Ahmad (2015) speak about this bonding value of a gift. Even when a recipient does not like the gift, there is the consolation of the intention to please. Thus, while not necessarily being enough to create a relationship on its own, a gift may help to foster or strengthen relationships. Some gift items or gift occasions may have a special significance in different cultural traditions.

In the private sector, gift giving to those with whom one does business is at times standard industry practice. Gifts are used to build trust and friendship with current and potential business partners. It may serve as an expression of appreciation for clients’ business (Schultz 2007). At other times, small branded items usually referred to as “corporate gifts” can be aimed at bringing the giving company to the mind of the recipient as an option to do business with, thus helping to develop and maintain longer-term relationships (Fan 2006). Gifts can take various forms – cash, vouchers or tickets, items, discounts, sponsorships and endorsements, accommodation, etc. Some gifts are thus more tangible than others. Since the receiver of a gift could be influenced to do something for the giver out of gratitude for the gift, it is no surprise that certain gifts in certain circumstances may come under suspicion as being designed to unduly influence or to put pressure on the recipient so as to obtain a reciprocal favor.

Incidentally, the use of influence to get favors is a natural facet of human life. If Alan needs to borrow money from Bob and knows that Bob is more likely to agree to lend the money if a mutual friend, Carlos, does the asking, Alan may ask Carlos to appeal to Bob. Almost everyone has someone whose word weighs more than that of others. At times, the source of influence is not mere friendship: it could be that Carlos occupies a formal advisory role with regard to Bob, has access to reach Bob, or has power to act for Bob.

Gifting and influence involving the public sector are dealt with in another entry; hence, this entry concentrates on gifting and influence within the private sector, between one private company and another.

## Gifting and Influence Under Suspicion

If one classifies all human actions as good, neutral, and bad, then most people would probably agree that gifting in itself is a good, or at the very least neutral, human action. The same might apply to the use of influence. This is one of the conditions for an act to be judged good – that it should be an act that is good in itself or at least neutral. In order to conclude about the goodness of the act, however, two more conditions need to be examined: the purpose of the act and its circumstances. Flaws in purpose and circumstances can turn either gifting or the use of influence from good or neutral to bad actions. Thus, for example, in the case where Bob works in a bank and bends the lending rules in order to please Carlos, who is his brother's friend or has given him a gift or the promise of a gift, the transaction could be queried, and one would have to examine the other two conditions for an action to be good. In Bob's case, problems could come up in connection with the intention behind the giving or receiving of the gift and the circumstances of the act of gifting. Circumstances to be examined include the identities of both giver and receiver and their positions of trust in their respective companies, especially with regard to the receiver's power to decide or allocate his or her company's resources, the nature and size of the gift (e.g., the market value), and the timing of the gift. The whole situation has to be considered as a whole. Timing may become irrelevant if the giver and receiver had a previous (explicit or implicit) understanding that something would be given after the transaction or if the gift, though being after a current transaction, would influence the receiver in foreseeable future dealings with the giver. At times, the gift is received by proxy but has the same effect. Consider, for example, an expensive wristwatch given to the receiver's wife or son as a birthday gift or a bus donated to the receiver's favorite charity or religious affiliation. Insight into Bob's and Carlos's intentions and the circumstances of their actions can help to see the rightness or wrongness of what they have done.

Essentially, what this means is that something that is generally construed to be a harmless

business practice has the potential to be identified as a harmful one (such as bribery). Gifts are by definition free, with no expectation of a reward. In contrast, bribes are usually gifts (cash and non-cash) or favors given or promised in expectation of reciprocal gifts or favors, with the purpose of influencing the receiver's judgment or conduct to favor oneself rather than another person or entity to which the receiver is responsible. In such a case, the "gift" becomes a bribe. For example, a procurement officer from company A might only buy from suppliers who exhibit "gratitude" to him by giving him gifts in cash or kind. Rather than using criteria that determine the best supplier for the company in making his decision, he might instead use criteria that determine which supplier caters to his personal interest. Similarly, a recruitment officer or other human resource professional might process the applications of candidates who give him or her something, again thereby prioritizing self-interest over the company's interest. Staff in a human resource department might process applications and requests of colleagues who give them gifts over those of the ones who do not, without caring how this affects the company's operations.

In the above examples, the company's employee is engaged in suspicious receiving. They could also be engaged in suspicious giving, very often to win contracts, as would be the case when a supplier company's staff offers a bribe to the decision-making person in the buyer company so that his or her company's product will be chosen without competition being given a fair chance. Even if the supplier company does not intend to influence decisions of the client/buyer's staff in its own favor, this may happen nonetheless, either because the employee of the supplier company intends to do it or because the client/buyer's staff is influenced anyway. One possible motivation for the supplier company's employee to seek to unduly influence could be if he or she would get more sales commissions or a promotion or the reputation for making those sales. In either case, the employee in Company A may choose to give business to the supplier company even when there is a more profitable deal for his company in an alternative partnership, just because of the

personal interest in the gift. Employees might also make gifts in order to ensure favorable press or to avoid unfavorable press.

Stolen gifts constitute a different species of gifts that are suspect. For example, an employee in a hairdressing salon uses his or her employer's products during working hours to attend to the hair of a friend. In this case, the friend receives a gift that is not the giver's: it has been stolen from the employer. The employee does the giving out of a personal interest in giving, and perhaps for the gratitude of the receiver, and in doing so acts against the interest of the employer. The situation would be different if he or she had used personal time and materials. Then it would really be a gift.

### **Peddling Influence**

At times, rather than an outright exchange of gifts and favors, what is traded is influence. Influence peddling is highly associated with corruption and scandal (Winters and Weitz-Shapiro 2013). For example, a manager in the supplier company might use his or her influence to give a job to the son of the procurement manager of Company A, in exchange for obtaining the contract from Company A. It is a sort of bribe, albeit intangible. Or a manager in Company A may use his or her influence among colleagues in the HR department to ensure that his or her son is employed to fill a vacancy. In both cases, something has interfered with the ordinary fair recruitment process in order to favor one of the candidates. Eventually, it may be that the candidate employed is not the best one, so this hiring is not in the interest of the company. Even if the two interests appear to coincide, as would, for example, be the case if the best candidate also happens to be the son of the manager, going ahead with the employment of this candidate could also give rise to other problems in the company. One possible problem could be the appearance of the candidate having been favored even if he or she was the best. This could lead in turn to others in the company feeling justified, within their various roles, to also put their personal interest above that of the company. If, despite this danger, the company's representatives

wish to go ahead with the recruitment of the best candidate, a greater transparency in the process could ameliorate this effect. Another possible problem could be the future interactions with the candidate: the appraisal and promotion processes could become difficult for the candidate's supervisor, since he or she might either be too soft, in order to not offend the candidate's real or perceived patrons, or too hard, in reaction to the candidate's perceived unfair advantage over others. Yet another problem could be if the candidate puts in less effort to perform well on the job because he or she has experienced a real or perceived favoritism over others and expects it to continue. For example, a new employee who thinks he was employed because of his relationship to his boss rather than due to merit may treat his responsibilities in a lax manner because he does not fear discipline or censure from his boss. In all cases, the way the conflict of personal interest with the company's interest has been handled has the potential to harm the organization.

### **Conflicts of Interest**

When gifts and influence go wrong, the underlying problem is often a conflict of interest situation where the agent (the person experiencing the conflict) faces tension between choosing self-interest and choosing the interest of the organization and chooses self-interest (Dana and Loewenstein 2003). The earlier example of the hairdresser also illustrates the self-interest considerations that could lead someone to go to the extent of gifting what does not belong to him or her, for personal gain. Interestingly though, self-interest does not always entail a financial motivation, as in a situation where the agent values being considered generous over the best interests of the company. Despite the foregoing, it is important to keep in mind that not everyone chooses self-interest when they experience conflict of interest. Otherwise, it would be very difficult for business to operate. For society to function, there is a need to entrust people with power and resources in many different roles and interactions (e.g., company directors, management team, fund trustees, drivers,

gatemmen, school teachers, hospital doctors, babysitters, committee members, development NGOs, union representatives, and countless others) where they could do great harm by disregarding the interest of the source of such power and resources but they do not. Usually, there are particularly strict rules against gifting and influence in the public sector, since public officials are by definition the repositories of public trust and have power over resources held for the common good. Whether private-to-private or private-to-public, the misuse of gifts and influence by the private sector contributes greatly to the spread of corruption wherever it becomes a common practice.

Since it is not possible to avoid all occasions where conflict of interest might occur, companies usually try to have only people they trust in positions where the company could be harmed if the agent chooses self-interest. Agents' roles are therefore, at times, referred to as positions of fiduciary responsibility. In such positions, the agent has power over the resources of the company and can make decisions on its behalf. If the agent betrays the company's trust over and over again, this can have serious consequences for the future of the company. When the company as a whole systematically supports the giving and receiving of gifts that are actually bribes, further damage is done to the whole society as the level of trust drops so that there is little room left for fair competition. Within the company itself, other types of unethical behavior by employees are easily rationalized, and quality of its products or services may also be compromised, because the contracts are obtained either by bribing with gifts or by peddling influence. Hence, there is no real push to perform, as there is no moral ground to demand a high standard of delivery.

## Cultural Nuances

It has been argued that some cultures consider gifts and influence as neutral and even positive aspects of life and that, in these places, they cannot be considered as corrupt practices or as occasions for corruption. In these cultures, they are simply part of the accepted norms. Hence,

companies operating outside their home country should be sensitive to the gift practices of other cultures. This is true to the extent that, in such cases, gifts and influence do not lead people to betray the trust placed in them, precisely because they do not influence the agent to act against the interest of those who engaged him or her in that position. Also, in those cultures where gifts and influence are accepted practices, there is usually a distinction between gifts that are simply gifts and gifts that lead people to make unethical or unfair decisions. Among the Yoruba people in Africa, for example, gift is expressed as *ebun*, while a gift given to influence a decision is called *abetele*. The latter is frowned upon, as it literally means that something has been used to plead beforehand, outside of the fair consideration owed to both parties.

## Solutions

Companies that provide precise and unambiguous gift policies tend to be less susceptible to situations of conflict of interest related to gifts. Clear policies help to protect employees' integrity and encourage ethical business conduct. They are usually contained in or linked to the company's code of ethics or code of conduct and give guidance as to what is allowed and what is prohibited with regard to gifting and to anything similar to it (e.g., facilitation or lobbying). Some companies also have further guidelines for specific functions like procurement and recruitment. The clarity of a company's policies also enhances transparency, so that other employees have no reason to distrust those that have power over resources based on suspicions that they are acting in personal interest. Thus, to a large extent, both the incidences and the appearances of conflict between an employee's duty to safeguard the company's interest and personal interest are reduced.

Depending on the nature of the company and its operations, the policy should be crafted to achieve its aim of reducing the conflict of interest situations that could arise. A zero-tolerance policy, currently adopted by many multinationals, is a good option. However, it is not always the most

practical approach as it can place employees in an awkward situation, especially in countries where gift giving is an important part of the culture and is a customary way to build relationships. In such cases, training the employees on various ways to say no to gifts (in either giving or receiving them) helps to avoid relationship damage. A simple explanation that *my company does not allow it although I really appreciate your gesture* can be more cordial than an unequivocal *no* that may be taken as an accusation of bribery and therefore an insult (whether or not this is the giver's intent).

Other experiences with the zero-tolerance policy have led some companies to introduce exceptions into their gift policies – exceptions such as modest hospitality, gifts on retirement, small items that are common industry practice, small promotional branded items, articles of limited value (with a limit also to the frequency), and similar instances where it is felt that the gift would not create a conflict of interest situation. Others prescribe that gifts can be received but are always to go to the company rather than to the agent, letting the giver know this, so that there is low likelihood of the agent being influenced in favor of the giver since he or she does not benefit from the gift. Some companies donate to charity the gifts received by their employees, while others put them in a pool for all the employees to share. Again, these steps minimize the possibility of the agent being influenced by the gift to act based on personal interest.

In order to promote fair competition for businesses, some governments have sought to limit corruption in the private sector by providing legislation on these matters. For example, in South Africa, the Prevention and Combating of Corrupt Activities Act 12 (2004) forbids offering, giving, or requesting gratification as an inducement to award or withdraw tenders for supplying goods and services. This law is also against rewards given for these reasons.

## Conclusion

Research and common experience show that gifts tend to strongly influence the receiver's behavior

in favor of the giver because they easily make the receiver feel an obligation to reciprocate, independently of the intentions of the giver (Katz et al. 2003; Marcoux 2009). Whenever receivers are moved to reciprocate using power and resources that have been entrusted to them for the interest of their company rather than for their personal interest, something has gone wrong: the gift has taken on the shape of a bribe. In the same way, when a person with fiduciary responsibility uses influence for his or her personal interest rather than the interest of the company he or she represents, something has gone wrong. Hence, while it is not possible and, in some cases, not even desirable, to altogether avoid gifting and the use of influence in human interactions, it is important to be mindful of the possibility of creating conflict of interest situations that can ultimately jeopardize the interest of the company. When a company puts in place clear policies on gifting and influence peddling, it minimizes the occurrence of conflict of interest situations and thus reduces the potential for unethical behavior and corruption within and outside the company.

## Gifting and Influence in the Public Sector

Kemi Ogunyemi

Lagos Business School, Pan-Atlantic University, Lagos, Nigeria

### Synonyms

Bribery; Corruption; Facilitation payments; Questionable payments

### Introduction

“Public sector” is the term used to describe the services provided and funded by the government as well as the enterprises owned by the government. They comprise a body of people and institutions entrusted with ensuring the well-being of everyone in society, usually employing various tiers in order to be effective. They act as guardians of common resources and promoters of the common good. For example, they cater to the community’s basic needs and supply essential infrastructure (Németh et al. 2018). The phrase “public sector” is commonly used to denote the activities of these people and of the organizations in which they work, in contrast to the private sector, where people are in business for private profit. People who are active in this sector include those working to make and enforce laws for the country; those assisting the judicial processes of the country; and those making decisions about the allocation and use of the country’s resources. Very

often, they act on behalf of the whole country. At other times, they act on behalf of smaller jurisdictions within the country, i.e., regions, states, local governments, towns, villages, districts, quarters, and wards. In some countries, the public sector, or part of it, is called the civil service. Since these people act on behalf of their fellow citizens, they are in an agency relationship to the latter and they have a unique responsibility to be fair and impartial in doing what is best for the country. This is usually referred to as a fiduciary responsibility, meaning that agents are trusted to act in good faith on behalf of their principals. To highlight the high moral standards expected of professionals in the public sector, this entry looks at the practices of gift-giving and influence peddling as they relate to public officials.

### Why Discuss Gifts?

Gifting or gift-giving is a practice that dates back to prehistoric times. It usually demonstrates good will and benevolence and fosters an amiable relationship between the parties, usually a giver and a receiver. In themselves, therefore, giving and receiving gifts are good or at least harmless practices. However, giving and accepting gifts can be misused and abused when public employees are involved, when the purpose of the gift is to gain special favor or an unfair advantage over others or to influence the decision-making process of lawmakers and regulators. In such situations, the gift becomes a bribe.

According to the Merriam Webster dictionary, a gift is “something voluntarily transferred by one person to another without compensation”<sup>1</sup>. A bribe on the other hand is “money or favor given or promised in order to influence the judgment or conduct of a person in a position of trust”<sup>2</sup>. Since there is a delicate balance between what constitutes a gift or a bribe, it is always advisable that there are clear guidelines to govern the acceptance of gifts. For this reason, many

<sup>1</sup> <https://www.merriam-webster.com/dictionary/gift>

<sup>2</sup> <https://www.merriam-webster.com/dictionary/bribe>

public service codes incorporate official policies in this regard.

## Policies on Gifting in Some Countries

Policies concerning gifts vary in different countries. Some countries enforce a zero-tolerance gift policy for public officials while others have a list of criteria that have to be met for the gift to be accepted. Some governments, for example, Canada, leave it to the discretion of the public employee's superiors to make the decision whether or not to accept the gift. In addition to this, "despite the general prohibition found in the Treasury Board's Model Code, a gift, hospitality, or other benefit is acceptable if it satisfies all of the following criteria:

- It is infrequent.
- It is of a minimal value.
- It is within normal standards of courtesy or protocol.
- It arises out of activities or events related to the official duties of the public servant.
- It does not compromise or appear to compromise the integrity of the public servant or of his or her organization." (McGurran 2013)

With the United States in mind, Richter and Burke (2007) state that gift giving to public sector staff, especially by lobbyists, is viewed with disfavor and can even be classified as a crime (i.e., bribery). Nigeria is closer to a zero-tolerance policy in this regard. The Nigerian Constitution (1999), Fifth schedule, part 1, states:

"6. (1) A public officer shall not ask for or accept property or benefits of any kind for himself or any other person on account of anything done or omitted to be done by him in the discharge of his duties. (2) for the purposes of sub-paragraph (1) of this paragraph, the receipt by a public officer of any gifts or benefits from commercial firms, business enterprises or persons who have contracts with the government shall be presumed to have been received in contravention of the said sub-paragraph unless the contrary is proved. (3) A public officer shall only accept personal gifts or benefits from relatives or personal friends to such extent and on such occasions as are recognized by custom:

Provided that any gift or donation to a public officer on any public or ceremonial occasion shall be treated as a gift to the appropriate institution represented by the public officer, and accordingly, the mere acceptance or receipt of any such gift shall not be treated as a contravention of this provision."

Sections 11, 12, and 13 of the Code of Conduct Bureau and Tribunal Act also restrict loans, gifts or benefits to certain Nigerian public officers to avoid bribery and abuse of powers.

Laws and policies are essential in providing guidelines for appropriate behavior regarding gifts, as differences in the perception of gifts in different cultures suggest that "gift giving is a highly contentious and subjective issue... [I]f clear guidelines are unavailable to employees as to the correct and ethical conduct in these circumstances, it may instigate or result in corrupt behavior or the perception thereof" (Jones and Bezuidenhout 2014: 76). Using South Africa as a case study, Jones further suggests that allowing gifts classified as traditional or cultural hospitality or as cultural gifts could still cause problems when these terms are not clearly defined. Hospitality could at times end up constituting a very expensive gift (for example, a cruise) that can sway a corrupt official (Jones and Bezuidenhout 2014).

## What, If Anything, Is Really Wrong with Public Sector Gifting?

An illustration can help to explain the problem with the kind of ambiguity described above. In a certain town, Deen is in charge of settling land disputes. His daughter is getting married in 2 weeks and he is worried about the expenses. As he sits in his office, a messenger arrives from Chief Barkis who has a case pending for Deen's decision. The messenger says that he has brought with him a lorry-load of farm products as a gift from the chief to celebrate the wedding of Deen's daughter – he only stopped by to know where to deliver the items. Deen figures that it is traditional or cultural to accept congratulatory gifts on this type of occasion. However, he knows that, after this, it would be difficult for him to award the land in dispute to the other claimant, Elder Kors, no

matter who actually has the right to the land. Yet, traditional and cultural gifts are allowed by his departmental policy on gifting. So, he would not have technically done anything wrong; it is not as though Chief Barkis had offered him a wad of cash or a Rolex wrist watch.

Deen is experiencing a conflict of interest. In the interest of the people he represents, the public, he should be objective in doing his job. However, his personal interest is to make Chief Barkis happy, out of gratitude that Chief Barkis has solved his problem. He is in a position of trust, where he should put the interest of the public before his own, even if the policy does not specify it. Codes cannot specify everything; hence, individual integrity is always important. For example, referring back to the Canadian code, the gift from Chief Barkis is a one-off gift and therefore fits under the heading of “infrequent.” However, it is not of minimal value, and whether it is within normal standards of courtesy or protocol may be debatable. What is really more important is that Deen is not led to act against the trust placed in him as a public official.

It is normal to experience conflict of interest situations. At times, it is not foreseeable and there is no way the public official could have avoided the conflict. However, what shows integrity or lack of it lies in what the person does in the moment of conflict. If trust is betrayed, unfair decisions may be made and these would affect the country negatively. Even if Chief Barkis has the right to the land, and so Deen would make the right decision by awarding it to him, there is still a danger: people around Deen may believe, in this case falsely, that Deen only awarded the land to Chief Barkis because of the magnificent gift bestowed on him. A few of these people may ask Deen about it and have the option of believing what he says. Many others will not ask; they will simply draw their own conclusions. Some of the latter will interpret this as a sign that it is acceptable to put their interests above the common good of the country in their own roles. Others may not find it acceptable and, as a result, may not work hard or happily in a place where they have perceived injustice to be condoned. Others may take it as an excuse to disregard other portions of the policies. If, instead of a land dispute, the issue

were a contract bid and Chief Barkis ended up obtaining the contract because of his influence on Deen, it may become difficult to enforce the contract or insist on it being done at a high quality. Deen, having benefited from Chief Barkis’s largesse, may be unable to put pressure on him to fulfil the contract terms. Chief Barkis, having expended a lot of money on the gift(s) that helped him to secure the contract, in trying to recover these costs from the same project may skimp on the quality of delivery. If it is a road contract, it may mean that the road is badly constructed and therefore people suffer car problems and accidents. Thus, the public ultimately bears the cost of what Deen has enjoyed. Consequently, there are good reasons to avoid situations of conflict of interest, including those provoked by gifting. It is one of the ways to reduce both real and perceived corruption in the public sector and in society at large.

Where there are high levels of perceived corruption, it generates a widespread distrust of public institutions, which can have more devastating effects than corruption itself. It may also foster a culture of careless gifting, which in turn may raise the levels of real corruption (Melgar et al. 2010). It is therefore important to reduce real and perceived corruption due to gifts being offered to and accepted by public officials. Such reduction can be achieved in part by ensuring that laws and policies regarding gifting are transparent, unambiguous, and clearly stated. In the process, it should always be kept in mind that the problem is not necessarily the gifting in itself; it is also the potential conflicts of interest and potential abuse of trust that derive from putting personal interest above the common good. Having such an understanding could help to guide public officials so that, even when there is a lack of clarity or there is a gap in policy, they are likely to act with integrity.

## Regarding Influence

Apart from gifting, another cause of conflict of interest for professionals in the public sector is the use of influence (Altun et al. 2013). Influence peddling by a public official is the use of his or her position or political influence or connections

with others in authority on someone's behalf in exchange for money or favors, in order to obtain favors or preferential treatment for that person. It is perceived differently in different environments, perhaps to the extent that it is considered as something that can precipitate conflicts of interest. Influence peddling has been proscribed as an offence and an illegal act in some jurisdictions, while some other jurisdictions do not consider influence peddling as illegal but rather as a species of lobbying. In jurisdictions where influence peddling is considered an offence, the terms normally associated with it are abuse of power, unfair advantage, opaque decision-making process, unethical acts, and protection of the interests of a select few.

Some features to look out for in trying to determine whether influence has been peddled are:

- (a) The material action carried out or its outcome
- (b) An intentional or conscious use of influence contrary to law and/or equity
- (c) Favor(s) obtained from a decision-making authority

As with real and perceived corruption, influence peddling can be either real or presumed. In both cases, harm can be done, as explained above when discussing the topic of conflict of interest. Hence, there are good reasons to avoid influence peddling, including in order to forestall conflict of interest situations. A business arriving in a country to set up operations should first find out about its laws and guidelines on influence peddling. Most European countries consider influence peddling as an offence, with France being one of the first civil law countries to introduce it into criminal law.

The United Nations Convention against Bribery and Corruption (UNCAC) and the Council of Europe Criminal Law Convention on Corruption contain provisions against trading in influence or influence peddling (Article 18 and, respectively, Article 12). However, in its Recommendation 9, Principle 8, OECD appears to consider influence peddling as lobbying, and therefore it has no provisions against it. Also, the United States Supreme Court granted influence peddling First Amendment protection in June 2016.

## Some Instances of Influence Peddling

In Costa Rica, a big influence peddling scandal involved businessmen and senior executives in 2017. Some government officials had been pressured into releasing \$30 million in unsecured loans from the national bank, Banco de Costa Rica, to import cement. Several members of government were implicated in the ensuing probe, including the President, Luis Guillermo Solís. The president's popularity waned as the scandal unfolded, and he later lost the presidential first round vote partly due to this scandal.

In South Africa, the president and his "friends," the Gupta brothers, were investigated in a judicial enquiry into allegations of influence peddling.

In South Korea, the Samsung heir apparent was jailed for corruption in connection with a national influence peddling scandal which involved a longtime friend of the president, Park Geun-hye. The scandal led to the president's impeachment. The accused was alleged to have paid money to influence for a merger of affiliates and for his succession to control of the conglomerate.

## Final Considerations

In conclusion, both gifting and influence peddling are worth watching with vigilance, especially where the public sector is concerned. Employees in the public sector have a special relationship to the rest of society in that they are custodians of resources that are common to all. They therefore need to act with an awareness of this responsibility as they carry out their work, and to prove worthy of the trust placed in them. When public officials craft policies for their organizations and strive to build their institutional culture, areas of concern include how to reduce the occurrence of situations that place them under the pressure of conflicts of interest; how to train them in ethical decision-making and integrity of character so that they do not sacrifice public interest to their personal interest; and how to minimize the perception, where it exists, that they are likely to put

personal interests above their responsibility to the public.

## Global Corruption

Frank Vogel  
Transparency International, Washington,  
DC, USA

## Introduction

Professor Laura S. Underkuffler has noted that: “Corruption is an explicitly moral notion; corruption describes, in general parlance, a powerful all-

consuming evil.” She goes on to say that this idea, although often unarticulated, permeates both popular and technical discussions of the subject. Furthermore, because of the power of this idea, any approach to corruption that fails to reckon with its moral aspect will be both descriptively and programmatically inadequate.”<sup>1</sup>

Ensuring that an understanding of corruption needs to include a moral dimension takes the issue of corruption beyond the confines of the many laws that relate to the subject. Legal definitions often fail to capture the full dimensions of corruption. This is also the case when using the word bribery which is frequently treated as a synonym for corruption. Transparency International (TI), a global, nongovernmental, anti-corruption organization, defines corruption broadly as “the abuse of entrusted power for private gain.”

TI emphasizes the importance of differentiating between small-scale, or petty corruption, and large-scale, or grand corruption. Petty corruption involves the bribery of public officials by ordinary citizens to obtain services that to which they are entitled, a form of corruption that is akin to extortion to which the poor are particularly vulnerable. In 2016, after international consultations with legal experts, TI defined grand corruption as occurring “when a public official or other person (such as an associate or a business person who conspires with a public official) deprives a particular social group or substantial part of the population of a State of a fundamental right or causes the State or any of its people a loss greater than 100 times the annual minimum subsistence income of its people.”

The most effective means of measuring corruption are surveys of perceptions of corruption, such as TI’s annual *Corruption Perceptions Index*, and ones using detailed questionnaires that ask various categories of citizens about the bribes they pay, notably the TI *Global Barometer*. Further insights into the scale of corruption are provided by research into the difficulties that business people

<sup>1</sup> Laura Underkuffler, J. DuPratt White Professor of Law, Cornell University Law School – chapter 2 in *Corruption, Global Security, and World Order* (2009, Brookings), edited by Robert I Rotberg.

have in a country when seeking official permits and licenses, as it is frequently the case that red tape is a pretext for officials to seek bribe and the World Bank's *Doing Business: Measuring Regulatory Quality and Efficiency* provides valuable information of this kind. Detailed investigations of public sector projects and programs at community or municipal levels are also an effective means of measuring corruption and its impact.

Today, petty corruption affects many aspects of life in many countries and can include payments: to the police to avoid being charged for real or imagined crimes, to enroll children in schools, for access to doctors and health clinics, and to secure all manner of official permits and licenses. In its 2013 *Global Barometer* survey of 114,000 respondents in 107 countries, TI found that more than one out of four respondents had paid a bribe during the last year. TI concluded that: "every day, all over the world, ordinary people bear the cost of corruption. In many countries, corruption affects people from birth until death."

The late Michael Elliott started a cover story in November 1994 for *Newsweek International* with these words: "You're driving in Accra, capital of Ghana, minding your own business, when a traffic cop decides you've made an 'illegal' left turn. The spot fine? Fifty bucks, and no receipt. Your company needs telephone repairs in Beijing. The price? A fishing trip for everyone in the local telephone and telegraph office. You spend a day at the Venezuelan port of La Guaira, filling in forms so you can export mangoes. At the last minute, an official spots a typo. So sorry, all the paperwork has to be redone: that, or pay a 'special fee.' Or watch your mangoes rot. *Baksheesh* in Egypt, *dash* in Kenya, *mordida* in Mexico – corruption is everywhere, and ancient. Mercury probably ran a crooked messenger service on Mount Olympus. Anti-corruption laws are just as old: 'Neither shalt thou take bribes,' God told Moses, 'which blind the wise and pervert the words of the just.'"<sup>2</sup>

<sup>2</sup>Newsweek International, November 14, 1994, *Money Talks* cover story by Michael Elliott, as quoted in *Waging War on Corruption – Inside the Movement Fighting the Abuse of Power*, by Frank Vogel, Rowman & Littlefield, updated, 2016.

This personal perspective is complemented by the thousands of stories and complaints brought by citizens in 50 countries over the last decade to Advocacy and Legal Advisory Centers (ALACs) managed by TI. These stories from the victims of corruption, together with media reporting in many countries as well as investigations by government authorities, provide a picture of bribery and extortion and conspiracies to benefit officials at the expense of those they should be serving, from healthcare to agriculture, sanitation, housing, forestry, water, finance, the arms trade, and infrastructure construction.

Corruption is an age-old phenomenon. Today, testimony by business leaders before public bodies and testimony resulting from public prosecutions and surveys in such industries as defense, pharmaceuticals, agriculture, information technology, aerospace, finance, and telecommunications indicates that grand corruption is common in many areas of public contracting, sometimes involving conspiracies between organized crime networks and public officials<sup>3</sup> and/or between major multinational corporations and senior government officials. Frequently, power over national judicial institutions and the media protects public officials from prosecution. The proceeds that they accumulate are frequently laundered through the international financial system, including offshore tax havens, enabling them to invest in assets across the world.

Grand corruption often goes hand-in-hand with organized crime. The activities of international criminal networks are facilitated by public officials who are bribed to manipulate customs and police officials and/or to rig public contracts. Vast criminal networks engaged in narcotics, human trafficking, the sale of counterfeit pharmaceuticals, counterfeit pesticides, fake manufactured goods, the illicit sale of arms, and the killing of elephants for the illegal ivory trade all need to bribe customs officials and their superiors in many countries in order to succeed. And they all need to find ways to launder their ill-gotten gains so that they can invest them

<sup>3</sup>*Dirty Entanglements: Corruption, Crime, and Terrorism*, by professor Louise Shelley (2014 Cambridge University Press)

productively. These activities undermine world trade, destabilize the financial system, and add frequently to critical issues of security at the national, regional, and international levels.

Corruption also undermines both individual and global strategic security. Countries with the highest levels of corruption typically also have the highest levels of violence. Corruption is always present on a large scale where there are wars and frequently involves international organized criminal networks and terrorist networks who exploit corruption, including money laundering,<sup>4</sup> to finance their endeavors.

## Reform

While efforts to counter corruption have been made in many countries over the centuries, landmark actions in recent decades emerged from the “Watergate” investigations in the United States, which revealed bribe-paying at home and abroad by some of America’s largest enterprises. The result was the Foreign Corrupt Practices Act (FCPA) of 1977 which made it a criminal offense for a US company to bribe a foreign government official. With the enactment of certain amendments in 1998, the anti-bribery provisions of the FCPA were also made to apply to foreign firms and persons for corruption that takes place or is facilitated within the territory of the United States.

Pressure from the US government and business community and Transparency International, by then an influential international NGO, led in 1997 to the Organization for Economic Cooperation and Development (OECD) Anti-Bribery Convention, which by 2016 had 41 signatories. For the most part, the OECD Convention mirrors the FCPA. In the intervening years, the number of cases prosecuted in signatory countries,

particularly the United States, has grown significantly as have the penalties imposed.

The 1990s were to see other landmark developments to counter corruption. It had long been evident to experts in economic development that corruption was an impediment to economic and social progress in many developing countries, yet until the mid-1990s, there was no institutional support at either bilateral aid agency or multilateral levels for action. There was silence at the United Nations and the World Bank, for example, on the topic of corruption. Part of the explanation related to the Cold War and the willingness of the major powers to use foreign aid for strategic purposes as they sought to influence diplomatic relationships while turning a blind eye to the corruption in the aid-receiving governments. For example, US government concerns in the 1960s of mounting Russian influence in Congo led to the US government providing substantial foreign aid and military support to Congo’s President Mobuto, who was widely seen as among the most corrupt leaders in Africa at the time.

It is also the case that until the ending of the Cold War, there was not a single international nongovernmental organization (NGO) dedicated to anti-corruption. While many of the worst human rights abuses in poor countries directly relate to the use of authoritarian power by corrupt politicians and their henchmen, none of the human rights NGOs or those explicitly involved in antipoverty programs in the Third World attempted to draw significant public attention to corruption. The leading international media reported on corruption scandals as and when they happened, but their reports did not result in major calls and sustained campaigns by citizens for legislative reforms.

Transparency International (TI), officially launched in May 1993, was the first global nongovernmental organization to be exclusively concerned with the fight against corruption. It has influenced public awareness and public attitudes, promoted countless campaigns in dozens of countries, and contributed to shaping landmark legislation and important public statements by governments and official international institutions. Today (2017), TI has about 140 staff at its

<sup>4</sup>*National Money Laundering Risk Assessment 2015*, United States Department of the Treasury. <https://www.treasury.gov/resource-center/terrorist-illicit-finance/Documents/National%20Money%20Laundering%20Risk%20Assessment%20%E2%80%932006-12-2015.pdf> (Accessed 9 January 2017).

global secretariat in Berlin, Germany, and approximately 100 national chapters.

There are now also dozens of anti-corruption civil society organizations engaged in promoting democracy, protecting human rights, and advocating for judicial reforms. At the same time, the international media is shining an unprecedented spotlight on corruption and a number of specialized media organizations notably Global Witness, ProPublica, and the International Consortium of Investigative Journalists, which, with its *Panama Papers* disclosures, has raised and strengthened global public awareness of the reach and the damaging impact of corruption. In many countries, courageous investigative journalists expose corruption at the highest levels of government and business and stimulate public demands to end impunity.

The scale of academic interest in many aspects of the topic has also expanded enormously as has the number and range of authors researching and writing on diverse aspects of corruption. All of these developments have stimulated extensive discussions within major business organizations, such as the World Economic Forum and the International Chamber of Commerce, which in turn have promoted international efforts to curb corruption.

In the spring of 1997, the leaders of the group of seven major economic powers, meeting in Washington, agreed that curbing corruption required the active involvement of international financial institutions like the World Bank and the International Monetary Fund both of which responded with anti-corruption strategies and guidelines. In the following months, the regional development banks of Asia and Latin America followed by introducing anti-corruption policies based on those established by the World Bank. Importantly, the United Nations recognized that it too needed to campaign to secure an anti-corruption agreement embracing the great majority of its members. As UN Secretary General Kofi A. Annan was to stress in the Foreword to the United Nations Convention Against Corruption (UNCAC), which was formally ratified in 2005: “Corruption is an insidious plague that has a wide range of corrosive effects on societies. It

undermines democracy and the rule of law, leads to violations of human rights, distorts markets, erodes the quality of life and allows organized crime, terrorism and other threats to human security to flourish.”

UNCAC states that: “(t)he purposes of this Convention are: (a) To promote and strengthen measures to prevent and combat corruption more efficiently and effectively; (b) To promote, facilitate and support international cooperation and technical assistance in the prevention of and fight against corruption, including in asset recovery; and, (c) To promote integrity, accountability and proper management of public affairs and public property.”

In recent years, world leaders meeting under the auspices of the group of 20 have agreed on a series of plans to counter corruption and to encourage full enforcement by governments of international anti-corruption conventions. Building on these agreements, far-reaching pledges to counter graft were announced in May 2012 at an “Anti-Corruption Summit” in London hosted by then UK Prime Minister David Cameron. The participants in this latter event stressed in their final official statement: “Corruption is at the heart of so many of the world’s problems. We must overcome it, if our efforts to end poverty, promote prosperity and defeat terrorism and extremism are to succeed.”

## Citizen Engagement

In spite of legislative reform and the proliferation of international conventions, the lack of progress in curbing corruption worldwide has fueled growing public demands for reform. Examples include massive public demonstrations in Tunisia, Egypt, and elsewhere in the Middle East in 2011 and Ukraine in 2014 and public protests on a vast scale in Iran, Iraq Guatemala, South Africa India, Brazil, and Malaysia. There has also been unprecedented international cooperation among investigative agencies including investigations of the alleged diversion of over \$3.5 billion from a Malaysian development fund to relatives and associates of Malaysia’s president involving

the FBI in the US and its counterparts in Switzerland and Singapore, as well as some officials at the Malaysian Anti-Corruption Commission; the US Justice Department's FCPA prosecution of Alstom, a major French engineering company, which would not have been possible without cooperation from the police in Indonesia; the prosecution of the Odebrecht construction company of Brazil, which saw a US Justice Department record fine of over \$3 billion, resulted from intense cooperation between Swiss, Brazilian, and US authorities; and the prosecution of leaders of world soccer's (FIFA) governing association, which required the cooperation of US and Swiss authorities in the first instance and a number of other governments as the cases developed.

At a less dramatic but important level, NGOs have gradually been convincing bilateral and multilateral aid agencies to strengthen citizen engagement in the implementation and monitoring of a range of development projects. In many cases, the engagement of citizens in economic development projects can reduce the risks of corruption while strengthening local delivery of public services.

Curbing corruption demands not only international agreements and legal conventions, but it also requires the patience and long-term resilience to sustain public support for the building and/or strengthening of transparent and accountable institutions of government. These institutions must be answerable to all citizens and not just to an elite few. The forging of what Professor Michael Johnston has called "deep democratization"<sup>5</sup> to establish the institutional capacities in countries to guard against corruption is a vast, yet vital, challenge.

## Introduction

This entry describes a major initiative of the Organization for Economic Co-operation and Development (OECD) to eliminate secrecy and increase transparency in financial transactions concerning taxes involving diverse countries.

## Description

According to Meinzer (2012, p. 11), in 1989, the OECD established a Financial Action Task Force to begin "work on standards to counter money laundering." In the following year, the Task Force published a set of 40 recommendations specifying standards and procedures to encourage compliance among its members. "Encourage" is the operative word because there was no enforcement mechanism available, only "naming and shaming" political jurisdictions that failed to

<sup>5</sup> Johnston (2014).

comply. Political jurisdictions are mostly countries but they include protected territories (e.g., British Virgin Islands), special administrative regions (e.g., Hong Kong), or crown dependencies (e.g., Guernsey).

Standards, procedures, and aims of the Task Force changed over time. In 2000/2001, the OECD invited six tax havens “to create an international standard for tax information exchange”. This small group enlisted the help of all member countries of the OECD plus 11 other fairly well-known tax havens. As a result, according to Meinzer (2012, p. 6), “the overall balance in the group working on the standards was tipped overwhelmingly in favour of secrecy jurisdictions.” “Secrecy jurisdictions” is the descriptive name used to designate jurisdictions that offer companies and individuals some level of secrecy from total to partial in financial transactions, most notably transactions involving taxation and money laundering.

In 2002, the group produced its “Model TIEA” (tax information exchange agreements) “which was and remains the basis for all of the OECD’s future work to counter tax havens and offshore tax evasion.” Tax information exchange agreements have become the main vehicles for addressing the problems concerning some jurisdictions effectively legalizing non-residents’ violation of tax laws of other jurisdictions. There are two standards, a relatively weak one requiring the exchange of information on request (IR) and a stronger one requiring the automatic exchange of information (IA). In both cases, the delivery of relevant information depends on a willing and able private or public office or agent, and different jurisdictions have different kinds of agents operating with different social/cultural assumptions and practices, laws and regulations, economic and political realities, specific and general aims. The IR standard is weaker because it offers greater freedom for agents to craft their practices more suitable to local interests than to the general interests of all jurisdictions.

In 2009, the working group, now the Global Forum, undertook a new initiative with “leaders of the G20 countries” boldly declaring “that the era of banking secrecy is over” (OECD 2016, p. 32).

The bold declaration was plainly at best aspirational because, after all, the era is still far from over. What had begun, however, was the initiation of a peer review process designed to assess the relative compliance of participating jurisdictions with IR exchange. The more demanding, efficient, and effective IA standard was not yet on the table.

The peer review process implemented in 2010 had two phases. In the first phase, a jurisdiction’s “legal and regulatory framework for transparency and the exchange of information for tax purposes” was assessed, and in the second phase “the implementation of the [IR] standard in practice” was assessed. By 2016, there had been 253 peer review reports prepared, “comprising 98 Phase 1 reviews, 86 Phase 2 reviews, 27 Combined Phase 1 and Phase 2 reviews and 42 Supplementary reviews. . . Overall ratings [were]. . . assigned to a total of 116 jurisdictions after completion of the Phase 2 reviews. . . [resulting in] 22 jurisdictions. . . rated ‘Compliant’, 77 jurisdictions ‘Largely Compliant’, 12 jurisdictions ‘Partially Compliant’, and 5 jurisdictions ‘Non-Compliant’” (OECD 2016, pp. 14–15). So, only about 4% of those completing Phase 2 reviews were totally non-compliant with the IR standard.

While the 4% figure sounds impressive, Meinzer (2012) reviewed several reasons for challenging the usefulness of peer reviews assessing compliance with the relatively weak IR standard. Here is a sample. (1) IR does not address the question that the Chair of the Global Forum regards as “absolutely critical to achieving financial transparency,” namely, “the question of beneficial ownership – identifying the natural persons behind the companies and trusts and other arrangements” (OECD 2016, p. 5). Legal owners can be shell companies with a single employee resident in a foreign jurisdiction serving only to allow the real or “beneficial owner” to claim for tax purposes that payments of one sort or another are going to non-residents of that beneficial owner’s jurisdiction. (2) The Global Forum’s secretariat is located within the OECD and its peer reviews must satisfy the interests of members of that organization. (3) Information may be provided on request under very restrictive conditions, e.g., long timelines for delivery, very high prices,

or high demands for specific information up front. More precisely, a requesting agent might “have to provide the identity of a particular person, to make a statement on the information sought, to describe the particular tax purpose, to state the grounds for believing that the information is in the possession of requested state, and to provide the name and address of a person in possession of the information.” (4) There are no sanctions for non-compliance with the IR standard. (5) If information is privately held, governments can avoid responsibility for non-compliance.

One can get a better idea of the limitations of pre-2015 peer reviews assessing compliance with the IR standard by studying the strengthened review procedures introduced in October 2015. To begin with, “both the legal framework and the practical implementation” features will be assessed at the same time. Then there is a requirement “that beneficial ownership information be available” and there is some assessment of the “quality” of exchanges meeting the IR standard. More precise criteria of assessment are provided “taking into account the principles of effectiveness, fairness, transparency, objectivity, cost-efficiency, and co-ordination with other organizations.” “Guidance” will be provided concerning “the factors to be taken into account when evaluating a jurisdiction’s legal and practical frameworks,” and timing schedules for reviews of different jurisdictions will be provided “ensuring that a full period of 3 years since the last review has passed.” There will also be regional training programs for peer reviewers. Most importantly, in 2017, 50 jurisdictions will be assessed for compliance with the stronger IA standard, and another 50 in 2018. As well, there is a multilateral Convention on the Mutual Administrative Assistance in Tax Matters to which 106 jurisdictions have agreed to participate in, 83 of which are proceeding with peer reviews based on the IA standard (OECD 2016, pp. 19–24).

Summarizing the report, OECD (2016, p. 25) wrote: “Beginning in 2017 and accelerating again the year after, a flood of new information will start to be provided by financial institutions all over the world. It will include names, addresses, bank account balances, details of investments held in

certain entities among other types of information on a wide range of financial assets held by individuals and entities. This will make it increasingly difficult to hide money in financial accounts from now on.” If all this happens, then we will truly have entered a new era of banking transparency.

## Introduction

GMO (acronym for “genetically modified organism”) is a colloquialism applied to food and agricultural applications of advanced biotechnology, especially plants and animals containing transgenes (that is, gene sequences derived from

species other than the recipient organism). The expression is never applied to biomedical applications of gene transfer. GMOs have been the subject of controversy since the 1980s, when they first began to be discussed. This article includes a brief historical overview of the debate, focusing especially on the early years when opposing positions were initially established. It is questionable as to whether GMOs would present particularly significant case studies for business ethics were it not for the intensity of the surrounding controversy. However, given the hardened suspicions of opponents, key episodes in the development of GMOs have been viewed as instances of ethical failure, while for other episodes, philosophical questions are central to the points of controversy.

## A Short History

The most widely grown GMOs are non-food crops (e.g., cotton), though there is extensive cultivation of GMO varieties of maize and soya, as well as significant plantings of modified rice, papaya, and sugar beets. New applications of gene transfer appear on a regular basis, making a complete account impractical. Foods made using genetically engineered microorganisms may or may not be included in the category of GMOs. Most commodity cheese is now made with rennet produced by a modified bacterium. This dairy product is almost never included by people who discuss GMOs but milk from cows treated with rBST, an animal drug also produced by a modified bacterium, often is. Meats from cloned animals are often referred to as GMO, while meats derived from stem cells (still confined to the laboratory) have thus far escaped the moniker. At this writing, it is unclear how plants and animals with gene deletions will be viewed. The term itself has no regulatory significance, though plant and animal foods containing transgenes have been subject to labeling requirements in Europe for almost 20 years, and similar labeling requirements were adopted by the US Congress in 2015.

The first round of debate followed economic analyses predicting that the use of rBST would

be followed by a transition in the number and size of US dairies (see Hallberg 1992). This precipitated opposition in leading dairy states and among small-farm and labor advocates and led to a highly unusual 1-year Congressional moratorium on release of the drug introduced by Wisconsin Senator Russ Feingold (see Thompson 2007). rBST went on US markets in 1993 following a White House Office of Science and Technology report stating that repression of a technology on grounds of its economic impact was without precedent. As the rBST debate was peaking, a few environmental activists began to raise concerns about the impact of GMO crops, citing both concerns about gene-flow to wild relatives and the potential for development of “superweeds” (Rissler and Mellon 1996).

These early economic and environmental disputes were accompanied by a period of regulatory uncertainty. While Canada and Europe each created new authorizing legislation for governance of agricultural biotechnology, the USA developed an approach known as the Coordinated Framework in which no new regulatory statutes or bodies were introduced for oversight of food and agricultural biotechnology. Under the influence of US Vice President Dan Quayle’s anti-regulatory Competitiveness Council, a suite of laws including the Food and Drug Act of 1906 (administered by the Food and Drug Administration), the Federal Insecticide, Fungicide and Rodenticide Act (administered by the Environmental Protection Agency), and the Plant Protection Act (administered by the US Department of Agriculture). The Coordinated Framework offered no provision for labeling until 2015, and in fact even labels proclaiming “no GMO” were strongly discouraged well into the twenty-first century.

When the first agricultural crops containing transgenes appeared in 1997, resistance to GMOs took on an international dimension. This era of controversy is complex and it has generated an enormous literature with many competing theories vying to account for why these products became the focus of so much confusion and debate. A few themes are especially relevant to business ethics. First, the European Union was in the midst of harmonizing the regulatory

frameworks of member states, and as such the stage was set for political quarreling. A series of vulnerabilities ranging from the Chernobyl accident, which exposed Europeans to lethal risks from bad technical decisions made elsewhere, to a string of food safety snafus (with Mad Cow Disease at the forefront) made the European public ill-disposed to accept new food technologies readily (Gaskell and coauthors, 2004). On top of all this, American biotechnology companies initially insisted that European regulatory agencies should simply accept the judgment of US regulators, appearing to take an arrogant and high-handed approach to European concerns (Charles 2001). Then the United Kingdom grocery chain Sainsbury's experiment with clearly labeled store-brand GMO tomatoes turn sour when competitors began to advertise that their own store brands were GMO-free. In contrast, major US food manufacturers and grocers have never engaged in advertisements disparaging GMOs (Bruening and Lyons 2000).

These high-profile events were not the end of the story. The late 1990s through the mid-2000s saw a significant concentration in agricultural biotechnology, and by 2005 only three corporations were controlling over 98% of the GMO market. Intellectual property rights in GMO seed became a point of dispute with respect to the TRIPS agreement of the World Trade Organization (Thompson 2014). Decisions allowing the patenting of GMOs also led to significant shifts in the relationship between seed companies and farmers, who were prohibited from saving seed to replant. A series of lawsuits and aggressive enforcement of intellectual property rights reflected negatively on corporate handling of GMO products, and a complicated series of events among Mexican smallholders (who were legally prohibited from growing GMOs under Mexican law) generated significant adverse publicity among international small farm advocates. Several African nations refused to accept US GMO crops as food aid, creating yet another finger-pointing episode with some critics blaming African leaders for allowing their people to starve, and others blaming US officials for putting them in an awkward position (Zerbe 2004).

## Ethical Issues in Food Safety

While many of these clashes over GMOs remain open to interpretation both with respect to matters of fact and matters of ethics, there were instances of clear ethical failure, as well. Star-Link corn was a particular variety developed by the Aventis (later Syngenta) company that had a split registration under the US system. That is, it was approved for use as animal feed, but not for entry into the human food supply. Aventis's sale of the seed thus required segregation of Star-Link from supplies being channeled into the many processed foods containing corn. In 2000, traces of Star-Link corn were found in taco shells being marketed in US grocery stores, leading to a massive recall and a large fine levied against Syngenta (Beebe 2003). Less well publicized but perhaps more serious, a small Texas biotech company allowed corn engineered to produce a pharmaceutical product to remain in fields destined for production of food. Fines levied against Prodigene led to the company's bankruptcy (Fox 2003). In the only case to result in known fatalities, Showa Denko produced a genetically engineered dietary supplement that was linked to over 1500 illnesses and 38 deaths (Comstock 2000).

While these events have largely faded from the public's memory, a vague and pervasive sense of concern about the overall safety of GMOs gradually began to take their place. Coupled with the rising popularity of organic foods (which forbid the use of gene technology), suspicion and confusion over GMOs has carried into an age when the vast majority of large scale farms rely heavily on the use of GMO seed for cotton, corn, soybean, sugar beets, and, to a somewhat lesser extent, rice. An unbroken series of august scientific bodies have found that the techniques of biotechnology are not themselves sources for concern, yet public doubts persist. And as with debates over climate change, a small minority of scientists challenge the overwhelming consensus of the science community, fueling the expressions of distrust and conspiracy theories that have come to predominate in social media. The international climate of suspicion and doubt over GMOs has led some

developing countries to restrict their use in food crops (Herring 2015).

Like deniers of climate science, those who have opposed the utilization of GMOs to improve food crops in areas of the world where food needs remain critical have been subjected to sharp criticism on ethical grounds. Nobel laureate Norman Borlaug became a fierce advocate for agricultural biotechnology on the grounds that it could be used to address many of diseases that limit food production in less developed regions, as well as controlling weeds and insect pests that reduce the amount of food harvested from farmers' fields (Borlaug 2000). Robert Paarlberg has continued to advance Borlaug's position, noting that European opposition to GMOs has discouraged its use in Africa. Paarlberg argues that charitable NGOs operating in Africa have spread doubts about the technology, while African agricultural ministers have been reluctant to adopt varieties that are in wide use elsewhere because of the fear that even non-GMO crops would be rejected in commercially important European export markets (Paarlberg 2009).

## The Environmental Ethics of GMOs

Concern that gene transfer might pose a novel type of environmental threat was also a component of early debates over GMOs (see "► [Environmental Ethics and Sustainability](#)"). The sheer possibility of gene flow beyond the GMO was, at first, regarded as a potential hazard. In reaction, the Convention on Biodiversity (CBD) swiftly adopted precautionary language about the risks of "living modified organisms" (LMOs), instantiating genetically engineered organisms as inherently risky in the minds of many environmental activists (Baram 1996). This speculation led to the recognition that comparatively little was known about the movement of genes from agricultural crops to wild populations, irrespective of whether gene transfer had been used. A protracted debate over the possible spread of GMO maize into landrace varieties grown by small farmers in southern Mexico (where use of GMO maize was illegal)

included allegations of deceit, manipulation and fraud (Kinchy 2013).

Other environmental controversies had more focus on specific hazards. One early debate arose over the possibility that the US Environmental Protection Agency had overlooked hazards to the monarch butterfly in approving the initial registrations for crops containing genes to produce the Bt toxin for controlling lepidoptera (Shelton and Sears 2001). A second issue was that the first generation of GMOs had been developed using antibiotic resistant marker genes. Markers were needed to determine whether gene transfer had been successful and served no agronomic purpose, but there was concern that resistance to antibiotics could spread to other plants (Miki and McHugh 2004). Although these risks were often portrayed for public consumption as if they were unique to biotechnology, when viewed from the perspective of environmental ethics they illustrate a more general lacuna in the way we consider the environmental impacts of agriculture itself (Thompson 2007).

## Ethical Debates Over Labeling

European regulations for marketing food products derived from GMO crops or animals included a legal mandate for consumer labeling, but the question of whether consumers were entitled to know whether their food had been produced using biotechnology resulted in a protracted ethical and public policy debate in the United States. The position taken initially by the US Food and Drug Administration (FDA) reflected the viewpoint of the biotechnology industry: food labels that implied any sort of health claim were justifiable *only* when there is scientifically verified evidence of benefit or risk. Since early GMOs posed no scientifically verifiable benefit or risk, FDA not only saw no basis for *mandatory* labels, regulators actively discouraged even voluntary labels on the grounds that they had the potential to be ethically misleading to consumers (Thompson 2007).

This perspective was rejected by anti-biotechnology activists and was challenged philosophically by authors who stressed consumer's

right to be informed or to exit. These arguments drew upon democratic principles of citizen consent and the idea that many values beyond health benefits and risks could be relevant to an individual's decision about whether to choose GMO-derived foods or to avoid them (Thompson 2002; Streiffer and Rubel 2004). Responding to growing pressure from state regulatory actions, the US Congress passed a bill that will preempt many activist labeling campaigns in 2016, though implementation of the legislation is still undetermined at this writing (McFadden 2017). Weirich (2007) provides a convenient sampling of alternative philosophical perspectives on the ethics of product labels, in general, as well as many of the concerns that were crucial for the debate on GMOs (see also “► [Food Advertising](#)”).

## Ethical Impacts on Seed Saving

While the facts do not support doubts about risks to human health from GMOs, there is little doubt that the introduction of GMOs has significantly transformed the global seed industry. One impact is simply a massive concentration, as the three main biotechnology companies have acquired many seed companies both to ensure the opportunity to deliver GMOs to farmers and also to gain access to germplasm. Whether gene transfer is used or not, genomic tools avail new methods for companies to key agronomically valuable traits to specific genetic sequences (Howard 2017). However, it is farmer's ability to save and replant seeds that has attracted the most attention on ethical grounds. GMOs are typically sold to farmers under technology licenses that restrict farmers' ability to save and replant seeds, forcing them to return to the seed market on an annual basis (see “► [Indigenous Environmental Justice](#)”). While farmers who grow hybrid varieties of maize have long purchased seed on annual basis, some observers have argued that this commercial practice violates an implicit moral contract with farmers (Shiva 2016). Biotechnology companies have prosecuted a series of lawsuits against farmers who save seeds, engendering

significant public sympathy for farmers and hostility to the industry (Ziff 2005; Wiber 2009).

## Golden Mean

Andrew West  
School of Accountancy, QUT Business School,  
Queensland University of Technology, Brisbane,  
QLD, Australia

## Introduction

The golden mean (or “doctrine of the mean”) refers to the moral prescription that one ought to act in an intermediate manner, avoiding two contrary extremes (that would constitute immoral behavior). Although it resembles ideas of adopting a “middle path” or “acting in moderation” that are suggested by various moral philosophies, the golden mean is Aristotelian, and it is his articulation that is described here.

In Aristotle’s *Nicomachean Ethics* (*NE*), the golden mean is presented primarily in Book II,

chapters six through nine, in which he describes the concept, how it can be applied to particular domains, and provides some practical guidance on how it can be implemented. The discussion is preceded by a consideration of how virtue (*arête*, sometimes translated as “excellence”) ought to be viewed as a state of character, rather than a passion or capacity. Virtue is then described (and distinguished from vices) as the state of character whereby something is brought into “good condition” and where its associated work is performed well – Aristotle provides the example of the excellence of a horse, which makes both the horse itself good and makes it good at activities such as running and carrying a rider. Achieving the mean describes how this state of character occurs, and its achievement is analogous to a good work of art, where either adding or removing anything would detract from its goodness (*NE*2.6, 1106b10).

## The Mean as Intermediate

Although described as an “intermediate,” Aristotle clearly distinguishes between intermediate in an objective sense (“according to arithmetical proportion” (*NE*2.6, 1106a34)), where six is the mean of ten and two, and a relative sense, in which the circumstances of each person is taken into account. Concerning both passions and actions, Aristotle observes the possibility for excess, deficiency, and the intermediate and so identifies two vices (associated with excess and deficiency) in relation to each virtue. However, he also notes that not all passions and actions have a mean, with some being bad in themselves, including spite, shamelessness, envy, adultery, theft, and murder (*NE*2.6, 1107a10–11).

Actually determining the mean and acting in accordance with virtue necessarily involves both choice and the application of practical wisdom (*phronesis*, one of Aristotle’s virtues of the intellect). Nevertheless, Aristotle identified a range of domains in which he articulated particular vices and the associated virtue as the intermediate (*NE*2.7, 1107b1–1108b5).

|                                                                 | Vice<br>(of deficiency)  | Virtue                   | Vice (of excess)                |
|-----------------------------------------------------------------|--------------------------|--------------------------|---------------------------------|
| Fear                                                            | Unnamed                  | Courage                  | Cowardice                       |
| Confidence                                                      | Cowardice                | Courage                  | Rashness                        |
| Pleasures<br>and pains                                          | Insensibility            | Temperance               | Self-indulgence                 |
| Giving and<br>taking<br>money<br>(small sums)                   | Meanness                 | Liberality               | Prodigality                     |
| Giving and<br>taking<br>money (large<br>sums)                   | Niggardliness            | Magnificence             | Tastelessness<br>and vulgarity  |
| Honor and<br>dishonor<br>(great<br>honors)                      | Undue<br>humility        | Proper pride             | Empty vanity                    |
| Honor and<br>dishonor<br>(small<br>honors)                      | Unambitious              | Unnamed                  | Ambitious                       |
| Anger                                                           | Unirascibility           | Good-temper              | Irascibility                    |
| Truth-telling<br>in social<br>situations                        | Mock modesty             | Truthfulness             | Boastfulness                    |
| Pleasantness<br>regarding<br>social<br>amusement                | Boorishness              | Ready wit                | Buffoonery                      |
| Pleasantness<br>regarding<br>social<br>situations in<br>general | Quarrelsome<br>and surly | Friendliness             | Obsequiousness<br>or flattering |
| Shame                                                           | Shamelessness            | Modesty                  | Bashfulness                     |
| Pleasure and<br>pain at<br>another's<br>fortune                 | Spite                    | Righteous<br>indignation | Envy                            |

Together with the virtue of Justice, which, Aristotle argues, has only one vice (that of acquisitiveness), the intermediates articulated in these domains represent the virtues of character. These are complemented by five virtues of the intellect, including practical wisdom (discussed in detail in *NE*, Book 6).

## Application

Aristotle also identifies a number of practical considerations related to these virtues and the intermediate state. He notes that each of the three states (the two extremes and the intermediate) are all

opposed to each other, such that from the position of one extreme, the intermediate itself appears to be an extreme (“the temperate man appears self-indulgent relatively to the insensible man, insensible relatively to the self-indulgent” (*NE*2.8, 1108b20–21)). Furthermore, while some virtues (such as temperance) are more opposed to the vice of excess, others (such as courage) are more opposed to the vice of deficiency.

Practically, achieving the intermediate is not easy, and Aristotle does not provide specific guidance for what actions to take or how to respond emotionally. Instead, he refers to displaying anger and giving money “to the right person, to the right extent, at the right time, with the right motive, and in the right way. . .” (*NE*2.9, 1109a27–29), a sentiment that illustrates how his doctrine is not equivalent to “all things in moderation.” He does, however, offer some general guidance. Firstly, as one of the extremes is worse than the other, and given the difficulty of achieving the intermediate, we ought to aim for the least bad alternative. Secondly, we ought to consider our own tendencies, paying attention to our own experiences of pleasure or pain, and achieve the intermediate by actually aiming for the opposite extreme (“as people do in straightening sticks that are bent” (*NE*2.9, 1109b6)). Thirdly, given the influence of pleasure in particular, we ought to put it aside, and guard against it influencing our choices. Finally, it is worth noting that it is the person who deviates the most from the intermediate who is most blameworthy, and most noticeable.

While Aristotle’s mean does not provide specific guidance that enables the correct moral action to be clearly identified (in contrast to utilitarian ethics for example), it arguably provides a more adequate conception of moral decision-making, in as far as it explicitly incorporates both the use of reason and one’s emotions. Nevertheless, some disagreements in interpretation remain, such as whether “excess” and “deficiency” is best interpreted quantitatively or metaphorically and whether there are necessarily two vices that correspond to each virtue (see Urmson 1973; Hursthouse 1980; Curzer 1996).

With regard to applicability in the business sphere, although there are many applications of Aristotle's virtue ethics to business, these tend to focus on the development of character, identifying particular virtues of character (often going beyond those identified by Aristotle), the nature of practical wisdom, and the importance of community (also drawing on Aristotle's *Politics*). Although the golden mean itself is not ignored (see Bragues 2006), further opportunities for detailed examination of how it can be applied in business settings remain.

## Good Citizenship Education in the Context of a COVID-19 Reality

M. Ayaz Naseem, Adeela Arshad-Ayaz and Muhammad Akram  
Department of Education, Concordia University,  
Montreal, QC, Canada

## Synonyms

Ethical citizenship; Medical emergency;  
Pandemic

## Introduction

This entry highlights the citizenship crisis during the pandemic, which resulted in life-threatening/endangering behaviors of individuals across the globe. It also highlights the behaviors of the institutions (national and supranational) and states as members of the international community to argue that good citizenship not only lacks at the individuals but also at the level of states. To highlight the inadequacy of critical citizenship education, this entry takes the example of the response to the COVID-19 pandemic in Canada and the United States as the starting point. The need to rethink, reframe, and reimagine the concept of social responsibility in general and citizenship education in particular are discussed. The entry argues that the idea of relationality helps to take a pause, to step back and reconsider the way in which social responsibility or lack thereof is understood and defines, and the way solutions to address this issue are sought. The entry argues that to develop education for responsible citizenship, we first need to understand how we have come to understand and define the concept of social responsibility.

Here, the relational framework provides insights highlighting the complexities related to defining and educating about what constitutes socially responsible behaviors. Arguments in this entry are organized in the following way: First, a brief examination of the relational theory is undertaken. Basic premise of this theory and some of the takeaways from using the concept of relationality to understand social responsibility in current times are highlighted. Examples from the last 18 months of the global pandemic are used to illustrate some of the basic tenets of relational theory. Second, a critique of some dominant ways of understanding social responsibility and what constitutes socially responsible behavior is presented. Finally, the entry highlights the importance of the relational framework to develop a deeper understanding of what constitutes responsible citizenship – which in the opinion of the authors, should reflect the shared commitment to people-enablement by addressing all relational issues and co-constituted forms of oppressions.

## Relational Theory

The relational theory emphasizes that one can only understand reality relative to other objects. In other words, what is considered social responsibility in a given context can only be understood in a meaningful way by taking account of a host of other social factors, which include but are not limited to: how we understand the notion and dynamics of race, what are the dominant views about gender? What is the role of class in a given society? What kinds of policies are in place to protect the marginalized populations? What are the power struggles of marginalized groups, and what avenues of raising one's voice are available? Thus, the full meaning of a phenomenon can only be understood in relation to the economic, political, and social context in a given society.

In short, relational theory directs us to pay special attention to the wider relationships within socioeconomic and socio-political-cultural contexts. The relational approach challenges conventional sociological ideas about self, autonomy, independence, and competition, and emphasizes understanding the social, political, economic, and cultural contexts in which we live. Therefore when looking to describe and define social responsibility or socially responsible behaviors, we need to consider the broader sociopolitical and cultural societal context. In other words, any one behavior cannot be labelled as socially irresponsible and ignore other similar acts, relationships, and policies that may have similar effects. In doing so, there is the danger of watering down the whole concept of "social responsibility," thus making it a mundane, everyday occurrence, which can lead to the normalization of irresponsible behaviors and even widespread acceptance of such behaviors. To sum up, the relational theory framework directs attention away from isolated introspection of social responsibility towards exploring the dynamics of human relationships and their effects on what is considered social responsibility.

During the pandemic, policymaking relied heavily on a securitized, neoliberal, and so-called "scientific" approach instead of looking at a whole host of relational issues. Considering

relational issues can highlight why many of the policies related to the pandemic ended up dividing people and pitting them against each other rather than bringing them together in a socially responsible and consolidated effort to fight against the virus and different social ills.

## Social Responsibility and Good Citizenship

What is good socially responsible citizenship? This entry argues that good citizenship should not be confined to the level of the individual. To understand what good citizenship is (and is not), there is a need to look at the levels of institutions (both national and supranational) and states, in addition to the individual. At the institutional level, the pandemic has shown that most stakeholders, starting from the World Health Organization (WHO) to most governments and health institutions, failed to meet social responsibility standards. Looking at the top of the pyramid, WHO's handling of the situation, especially reluctance to declare COVID-19 a pandemic until March 11, 2020, defies any social responsibility concerns. The continuous conflicting messaging during the pandemic has led to a loss of faith in WHO's abilities – for example, the WHO spokesperson Maria Van Kerkhove during a press conference on June 8, 2020, issued a statement saying that the asymptomatic spread of COVID-19 was very rare. One day later, WHO had to retract and acknowledge that asymptomatic and pre-symptomatic cases were also important sources of the spread of the virus.

Similarly, the Center for Disease Control (CDC) in the United States encouraged people to wear homemade fabric or cloth masks. This advice, however, did not resonate with the country's history of systemic racism and marginalization of the non-white population. "With the racial profiling that led to the senseless murders of George Floyd and Ahmaud Arbery in mind, hiding one's face with a 'do it yourself' homemade fabric mask, going out and about 'business as usual,' and expecting to come back unharmed or alive is sadly not an option for many African

Americans in the United States” (Arshad-Ayaz and Naseem 2021). The fear of racial profiling led many to ignore the CDC guidelines intentionally. Asking people to cover their faces with homemade fabric/mask smacks extreme lack of empathy and extreme inconsideration on the part of national institutions such as the CDC. As Timmerman notes, “[P]olicymakers were unaware of even the most basic circumstances under which large groups of people within their jurisdiction live and work” (2020, p. 1). The CDC advice is an example of a one-size-fits-all mentality, and it does not work for all in all circumstances. Such policies or recommendations subscribe to a neoliberal understanding of the world, deliberately ignoring society’s diversity and related issues, focusing only on safeguarding economic interests.

COVID-19 has significantly impacted the political priorities and economic investments both at domestic and global levels. Its economic consequences include mass unemployment, expanded poverty, rapid inflation, and disrupted global supply chains. Though some countries such as New Zealand, Australia, Singapore, Hong Kong, and Israel responded efficiently, many other countries initially denied or downplayed the seriousness and severity of the pandemic (Great Britain, United States, Brazil, Russia). The former list of countries somehow contained the infection rates and deaths. Those in denial experienced massive human and financial losses. We term this as the “difference between leaders and managers” (Arshad-Ayaz and Naseem 2021). The leaders “took early decisive action and conveyed it to their publics through clear messaging, the managers delivered ambiguous (often contradictory) messages, politicized the response, and often ended up dividing the public rather than uniting it behind the cause of controlling the pandemic” (Arshad-Ayaz and Naseem 2021).

Any state’s successful response to a pandemic depends on a harmonious relationship between the state and the citizens. Both parties need to fulfill their respective responsibilities agreed upon in the social contract. The COVID-19 pandemic has highlighted the rupture in the state-

citizen social contract. Neoliberal policies have guided most states’ response to this pandemic with few exceptions. Economic interests were prioritized over health needs, especially in the early days of the pandemic. It endangered large sections of the population through the rapid spread of the virus and the health system’s inability to deal with it. Presented below is a briefly discussion of the relationship between state and citizens during the COVID-19 pandemic in the context of neoliberal policies. At the state level, the social responsibility of dealing with the pandemic was passed on to the individual via overnight stay-at-home and self-isolation procedures. While asking individuals to show socially responsible behaviors, such policies did not consider that self-isolation was a privilege many could not afford. As a matter of fact, in March 2020, working from home was possible for only 38.9% of Canadian workers. On the one hand, there has been the rhetoric of self-sacrifice on behalf of socially responsible citizens for staying home and maintaining social distance. On the other hand, there has been no acknowledgment that the heroic show of such socially responsible behavior by few was at the expense of others – mainly people of color, immigrants, and women in low-paying jobs who did not have the privilege to act in a socially responsible manner and had to continue their work as if a pandemic was not there. The majority of the population in Canada falling into the low income/flexible employment group did not have the luxury to act according to the state-defined socially responsible behavior.

The shallowness and hypocrisy of “thanking the essential workers” on evening TV were obvious when despite record profits, Loblaw’s, Metro, and other corporations announced that they would be ending a two dollars pandemic pay bump for their workers as soon as there was talk of reopening the economy. While workers in meat processing facilities, the agricultural sector, and other risky environments continue to work in under-compensated and dangerous environments, they also get labeled as vulnerable and risky populations. Such labeling has major consequences on how the rest of society views them. The neighborhoods where they live get marked as

“hot zones” for the spread of the disease, which justifies intensified surveillance of their communities and bodies. The highly securitized approach used by policymakers then divides the risky and irresponsible population from those presumed to be secure and socially responsible by limiting their civil freedoms and using other isolating mechanisms. Bryant et al. (2020) criticize Canada’s neoliberal response to the COVID-19 pandemic by highlighting the unequal, gendered, racialized, and class-oriented nature of Canadian social and health systems.

Finally, in this respect, the question that begs to be asked is, did the states act as good citizens in the community of states? The COVID-19 vaccine was pre-purchased by rich countries like Canada, the United States, the United Kingdom, Japan, and the European Union (Cioffi and Cioffi 2021). Canada even dipped in the COVAX pool of vaccines, which is mainly to supply vaccines to developing countries that cannot afford to produce or buy them. Though rich countries pre-purchased the vaccine to safeguard their own countries from the pandemic, they chose to ignore the relational aspect that they would not be safe from the virus until developing nations were vaccinated. WHO chief Ghebreyesus said, “vaccine nationalism would also lead to a prolonged pandemic as only a small number of countries would get most of the supply. Vaccine nationalism only helps the virus” (Lagman 2021). Tatar et al. (2021) also found that wealthy countries partnered with COVAX have substantive share and control over COVID-19 vaccine production and distribution. The citizens of rich countries who constitute 20% of the world population have access or control over 95% of the COVID-19 vaccine. In contrast, the rest of the 5% vaccine is for 80% of the population living in poor or developing countries. Countries such as the USA are now using its stockpile of surplus vaccines for diplomacy, mainly in its rivalry against China. Similarly, China and Russia have also used their vaccines stockpiles for wooing poorer nations to their camp. Such leadership implicitly conveys a message to their respective publics that they are

more important than others – me first and that it is alright to be selfish in the name of nationalism.

What constitutes good citizenship at the **individual level**? Is it following the government’s advice? For example, were people who initially wore masks in Canada being good citizens when the government advised them not to wear masks, and the national news televised doctors categorically telling people that there were higher chances of them getting sick if they wore masks. Were people who chose to wear a mask at that stage (a minority at that stage, a majority now) being socially responsible or socially irresponsible and unethical? Similar questions can be raised about those who followed the proclamations of former US President Trump and demanded the exercise of their right to choose – not to wear a mask, not get vaccinated, etc.? The recent protests by anti-vaxxers in front of hospitals and other health care institutions in Canada and the USA, which endanger the functioning and sometimes even the lives of health care professionals and fellow citizens, are yet another incident that begets the question of what is good citizenship? A related set of questions concerns the ability/inability of the public to clearly distinguish between rights/freedom and responsibilities. The entry contends that where the current pandemic brought forth the ruptures and deficiencies in the health systems, it has also highlighted the deficiencies in the education system that are evident in the “unsocial” and non-questioning behavior of citizens who not only deny the public health guidelines but also resist their implementation. “Just as the pandemic has shown the effects of years of neglect and underfunding of the health care system, it has also made visible the effects of underfunding and neglect of the educational system, especially of disciplines and subjects related to teaching and learning about responsible citizenship” (Arshad-Ayaz and Naseem 2021).

This neglect can, in better part, be attributed to the influence of neoliberal economic policies in the realm of education. Every aspect of citizens’ lives, including their educational abilities, is influenced by the neoliberal regime under which

the aim of education has “shifted from the social reform goals of broadening access to learning from the cradle to the grave, toward concentrating on employability and corporate identified needs” (Spencer and Lange 2013). As Peters (2020) notes, “neoliberalism, as an economic ideology... has depleted our public services, turned our education and healthcare into profit-driven businesses, hoarded profits at the expense of undervalued and underpaid workers, favoured profitability of a militarised world over human security and well-being, and aggravated inequalities between people and countries.” Five C’s of the neoliberal education – “competitiveness, conformity, conservatism, convention and commerce” (p. 1), are clearly reflected in the suboptimal behavior of the public (Sellars and Imig 2020, p. 1). These five Cs come at the cost of neglecting relationality which can help citizens connect the (social, economic, ethical, and cultural) dots. These five Cs have deeply impacted the values, epistemologies, and behavior of citizens (Arshad-Ayaz and Naseem 2021). States tend to reshape the citizens’ perceptions of rights and responsibilities towards themselves, fellow citizens, and the state with a focus on competition conformity and ultimate support for the economic market. A net result of the neoliberal restructuring of education is a preference for subjects that are market-oriented and related directly to “productivity.” As Smith and Upshur (2020) note, preference of science over social science has led to the neglect of education that can address issues related to responsible citizenship. The consequences of these policies are evident in the unethical and unsocial behaviors of the public during the COVID-19 pandemic. At the same time, the social contract between the public and the state also changes. On the one hand, “The emphasis on privatization, individualism, and autonomy has impacted the values, epistemologies, and behavior of citizens” (Arshad-Ayaz and Naseem 2021). On the other hand, the state expects individuals with inadequate citizenship education to keep calm, seek information, act responsibly, and survive a global health crisis without harming themselves and others while not expecting much from the state (Arshad-Ayaz and Naseem 2021).

## Conclusions

To conclude, the entry argues that a fragmented and isolated understanding of social responsibility is rooted in modernist neoliberal epistemologies and ontologies. The dominant mono-causal knowledge of what constitutes “socially and ethically responsible behavior” is based on neoliberal and consumerist ideas of freedom. Such individualist understanding inevitably constricts the scope of efforts and solutions needed to rethink, reframe, and reimagine the type of holistic-relational-critical understanding required for social and ethical responsibility necessary to save the planet and respond to the needs of the majority world.

The current version of social and ethical responsibility tends to focus on individual dimensions of people/issues/problems, thereby ignoring different relational aspects. To develop ethically just and socially responsible citizenship education, we need to pay particular attention to relationality and criticality. In other words, unethical and unjust attitudes and behaviors do not take place in a vacuum but are constituted by relations, within relations, from relations, and in particular contexts in which relationships take place. The entry also argues that authentic, socially responsible, and ethical models of (citizenship) education should reflect the shared commitment to people-enablement. A holistic-relational-critical, socially, and ethically responsible citizenship education model needs to address relational issues, including but not limited to, environment, sustainability, identity, migration, inequality, insecurity (including food insecurity), colonial impact, Black Indigenous and People of Color rights (BIPOC), social justice, and various forms of sustainability.

COVID-19 pandemic has made visible the inadequacy of neoliberal economies and the fault lines of health care, education systems, and good citizenship. However, it is not easy to get rid of the deep-rooted neoliberal neglect of sectors such as health care and especially education. It took decades to disinvest from human-centric subject areas that prepare citizens for critical citizenship, an education that helps citizens build resilient capacities amidst crises and think of solutions

outside the box. Multiple global crises during the last 2 years, hurricanes, floods, fires, ever-evolving pandemic, to name a few, have led many to question the paradigm of unbridled productivity. It is crucial for educators and policymakers to acknowledge the harmful impact of neoliberal policies in education. Education for good citizenship cannot be narrowly focused on economic outcomes alone. It needs an understanding of relational factors; such education should inculcate the citizens' ability to read the world along with their ability to read the word (Freire 1970). Good citizenship provides citizens with abilities to discern between the negative and positive use of freedoms, just as it empowers them to raise critical questions and ask for citizen-state reciprocity and accountability.

## Introduction

Governments, international organizations, societies, and investors increasingly put pressure on multinational corporations to pay a fair share of tax. Corporations should abstain from minimizing their tax payments. Should corporate socially responsible firms that voluntarily go beyond compliance with the law also approach their tax obligations from this perspective? And what about public disclosure of a corporation's tax strategy and tax payments (public tax transparency)?

These issues should be addressed by companies engaging in good tax governance.

### **Moral and Societal Meaning of Tax**

Taxes are a contribution to society seen as a cooperative venture (in the famous wording of John Rawls). Taxes, although paid to the state, support society in many ways. The tax system is an expression of fundamental moral values, such as liberty, equality, and solidarity. Though taxes often seem to be a rather technical, be it an economic or legal affair, they also are a truly moral phenomenon. Of course, (corporate) taxpayers often see tax as a cost item, which can be reduced with intricate legal structures, and state use of the tax system to compete with other states – vying for foreign direct investment. Nonetheless, tax is ultimately about supporting society and distributing the benefits and burdens of this cooperative venture. Citizens' obligation to pay a fair share of taxes is therefore a moral obligation to society.

### **Letter or Spirit of the Law?**

The fair share of tax that (corporate) citizens have to pay is codified in law. Unfortunately, any (legal) codification of the moral obligation to pay a fair share of taxes will inevitably fall short because the legislature cannot foresee everything and law always leaves room for interpretation and grey areas. Due to this lack of perfection, taxpayers face a choice with regard to how they are going to comply with the law. This choice involves moral responsibility. All tax actors bear some responsibility for the fairness and integrity of the tax system.

In most jurisdictions, taxpayers enjoy the legal right to structure their affairs in a tax-efficient way. But many taxpayers exploit this right by arranging their corporate structures and intellectual property so as to incur the minimum amount of (corporate income) tax in jurisdictions where they actually do business.

Especially the international tax system is a far cry from a perfect, consistent set of rules –

different countries use different approaches and conceptions of taxable events and the like. Taxpayers therefore often engage in tax planning merely in order stay in control of their tax liabilities. Moreover, tax planning is often used to avoid double taxation. Taxpayers may also make legitimate use of tax incentives which are deliberately created by states in order to steer citizens' behavior to attain some economic, social, cultural, environmental or other goal; this is sometimes called tax mitigation. A taxpayer may reduce her tax in other ways. Living in a border region, she may engage in tax avoidance by crossing the border and buying lower taxed goods and services. However, the term "tax avoidance" is often used to indicate that more is involved than simply engaging in activities that reduce one's tax liability. Tax avoidance is legal, and it is not tax evasion or fraud, that is, the deliberate omission, concealment, or misrepresentation of information to reduce one's tax liability. Although staying within the letter of the law, tax avoidance may conflict with the spirit of the law. This behavior is legal but may invite criticism from a moral point of view. Some (corporate) taxpayers even go a step further and artificially create opportunities to minimize their tax obligation by engaging in aggressive tax planning.

Imperfect tax laws provide opportunities for creative tax planning. By strictly complying with the letter of the law, taxpayers stay within the boundaries of the law but they may well violate the spirit of the law. This kind of tax avoidance is legal, it is not tax evasion, but is it moral? In the recent past, media published reports about many multinational corporations engaging in minimalist compliance with the letter of the law by using aggressive tax planning techniques. Thus, they evidently do not pay their fair share of taxes.

It is often argued that paying a fair share involves complying with both the letter and the spirit of the law. Thus, the definition of the concept of fair share depends on concept of the spirit of the law. Even though the latter lacks a coherent definition, it seems that, in general, not following the spirit of the law could be understood as consciously avoiding the tax consequences of the law that were meant by the lawmaker.

## Taxation and CSR

Corporate Social Responsibility (CSR) regards the responsibility of enterprises for their impact on society and accounting for this impact. CSR corporations have voluntarily and explicitly accepted the bottom line of CSR, which expects corporations to go beyond pure compliance with the law. Taxation is an important building block of society, enabling the state to furnish society with all kind of public goods and services. Combining CSR and tax promotes the idea that certain members of society should not be earning unfair profits at the expense of (the rest of the) society. CSR should help to fill in for the shortcomings of public governance systems, including the international tax system, with regard to problems related to corporate moral responsibility toward society. This does not mean that corporations should forget their economic responsibilities; moral behavior does not require denying one's own personal needs and aspirations.

Carroll's famous CSR pyramid may be helpful to clarify this. CSR firms voluntarily accept moral responsibility on top of their legal and economic responsibilities. These companies should therefore also interpret their legal responsibilities in a morally responsible way. This also goes for their obligations codified in tax law. Again, taxpayers are free to plan and structure their affairs to achieve a favorable tax treatment. There is quite a bit of disagreement about the fundamental principles underlying international corporate income tax which therefore are hardly able to clearly express the ideal of a fair share. However, recently the G20, OECD, and EU have taken important steps to improve the international tax system. Moreover, there is no moral obligation for CSR companies to behave like ideal (corporate) citizens and behave better than the average citizen. Furthermore, what kind of behavior does this moral ideal entail? Ideals are the subject of much debate and the same goes for the means (strategy) to realize ideals: consensus is often hard to reach.

Given the diverging opinions about what is morally acceptable behavior, it is better to start with coming to terms with regard to behavior that is morally irresponsible – behavior that evidently

does not sufficiently take into account the interests of others – bringing (disproportionate) harm to them. In practice, it is also far easier to agree on evident instances of injustice than on what counts as justice. Thus, there is a threshold, a minimum standard that a company engaging in CSR should not be willing to cross. Going beyond compliance means beyond strict compliance with the letter of the law. CSR corporations should not opt for aggressive tax planning in order to minimize their (corporate income) tax liability. They should not engage in this kind of irresponsible and profoundly unfair tax planning. On the contrary, socially responsible corporations are expected to go beyond the bare minimum of (ir)responsibility.

It is sometimes argued that CSR firms that focus on after-tax profitability may be able to increase social welfare in other ways, such as investment in infrastructure, R&D, and job creation. In other words, aggressive tax planning should not be seen as irresponsible corporate behavior since a corporation fulfills its obligations to society in other ways. This boils down to corporate power sidestepping democratic decision-making procedures. The same goes for the argument that taxpayers minimize their legal obligation to pay tax in order to participate in charitable giving. This engaging in philanthropy seems also rather opportunistic juggling with different layers of CSR, that is, elastic ethics. CSR and taxes should not be seen as substitutes.

## Good Tax Governance

Multinationals presenting themselves as corporations that operate according to socially responsible values should also apply these values in their tax planning practices by engaging in good tax governance. Good tax governance can be seen as a tool that guarantees that corporations tax strategies, actual tax (planning) behavior, and tax payments are consistent with their CSR commitment (substantive element) and also to communicate them properly (procedural element). The substantive element of good tax governance requires ethical decision making and developing tax values. The procedural element means being open about

the tax values and strategies of a corporation. Good – socially responsible – tax governance entails both.

Multinationals are complex entities with multi-dimensional layers of decision-making processes that need to balance conflicting interests. Taxation poses various challenges for corporate decision making. On the one hand, taxes are considered a cost that should be kept low in order to keep some stakeholders, such as shareholders, satisfied. On the other hand, taxes are a crucial contribution to society and, by avoiding their tax liabilities, corporations fail to account for the other stakeholders, such as society at large. For corporations that have chosen to endorse CSR, the second perspective should prevail.

The substantive element of good tax governance focuses on the amount of tax that a company pays, and asks whether this is more than is demanded by mere compliance with the letter of the law. Morally irresponsible tax behavior should therefore be avoided and companies should strive to comply with the spirit of the law.

Before turning to the procedural element of good tax governance, however, we have to answer the question whether business law, more specifically, corporate governance, allows businesses to engage in good tax governance.

## **Corporate Governance and Good Tax Governance**

Tax governance is for businesses an element of corporate governance. Corporate governance (CG) refers to the way power is distributed within a corporation and to the decision-making process with regard to the use of this power and accounting thereof. It is a set of rules and principles for how a (large) company should be regulated and managed. Among corporate law scholars, there are two prevailing theories when addressing the essence of a corporation. These theories, which reflect upon to whom corporations should be responsible and accountable, are shareholder theory and stakeholder theory. The first theory advocates the importance of the primacy of the shareholder interest and the enhancement of the

shareholder value. According to the stakeholder theory, however, corporations exist to serve also the interests of other parties in addition to those of shareholders (who seen as are internal stakeholders). These stakeholders include employees, creditors, customers, suppliers, and local communities.

However, are multinationals that have committed themselves to ethical business making, for instance in the form of CSR, allowed to opt for good tax governance? Or is such engagement contrary to corporate governance rules?

It is the responsibility of corporate managers to ensure that corporate legal obligations are met. The responsibility to operate in the best interests of the shareholders sometimes even seems to override the interests of other stakeholders. However, corporate managers should foremost act in the best interests of the company. Choosing the right tax strategy is also a task of corporate management. Corporate management has to follow the applicable laws but, at the same time, they also have the freedom to opt for good tax governance. Furthermore, balancing between shareholder and stakeholder approaches, in practice, is not an exact science. Whatever their perspective on CG (shareholder vs stakeholder approach), corporate boards should foremost act in the long-term best interests of the company. Without doubt, financial performance is crucial for the best long-term interests of the company. Furthermore, a financially healthy corporation can add more value to a society than a corporation that performs poorly with regard to its economic responsibilities. Therefore, corporate boards should balance between being profitable and being socially responsible.

Corporate boards that act in the best interests of the company take into account the interests of various stakeholders and balance those with the interests of the company and shareholders. This is the discretion that corporate managers have in their decision making. Therefore, to a certain extent, corporate boards are free to decide how responsible or irresponsible the company will behave in relation to the societies in which they operate. Boards have discretion to decide upon whether they engage in CSR and how they embed this into their business strategies. They

therefore enjoy discretion to engage in good tax governance.

## Tax Transparency

Tax transparency is the procedural element of good tax governance. CSR firms which voluntarily go beyond strict compliance should also go beyond strict compliance with the letter of legal disclosure obligations. Companies have to comply with many mandatory disclosure obligations vis-à-vis the tax authorities, also with regard to aggressive tax planning. However, there is an increased need for public tax transparency. CSR corporations may then voluntarily go beyond compliance with legal reporting obligations.

Public tax transparency is an instrument to reduce information asymmetry and enhance tax knowledge of market participants, investors and consumers. Transparency, for example by way of country-by-country reporting on tax payments, enables risk assessment. Moreover, public transparency is a precondition for accountability and open public debate, which also is crucial for creating a better tax compliance environment. Stakeholder engagement and a public debate promote a better understanding of factors business take into account in their tax decisions and the moral acceptability of tax planning practices. A fruitful debate is indispensable for developing standards of substantive good tax governance. In this way, voluntarily going beyond mandatory disclosure obligations may have an educative function. It may promote the general public's understanding of the dynamics of the international tax system and its participants, enhancing tax literacy. Increased transparency will moreover force all stakeholders in a tax system to answer difficult moral and justification questions about how that system works and the foundations on which it is based. Question such as: can wages tax and sales tax payments, or other payments to the state, be seen as substitutes for corporate income tax payments? Of course, it will take time for businesses to understand the dynamics and boundaries of transparency and to develop the competency and skill required to manage stakeholders'

expectations and responses – in short to become literate about transparency.

Uniformity in international standards helps to avoid confusion that is caused by different standards. Global Reporting Initiative (GRI) provides an important standard for tax transparency: “GRI 207: Tax 2019.” It is the first independent (voluntary) sustainability reporting standard for public financial and nonfinancial tax reporting, drafted by a multi-stakeholder Technical Committee, and came into effect on 1 January 2021. Investors, civil society organizations, labor unions, companies, and individuals around the world have endorsed this new tax standard as it will help meet their growing demand for tax transparency.

## Conclusion

Tax is a moral phenomenon. Enterprises bear responsibility for the fairness and integrity of the international tax system. This responsibility cannot be reduced to strict rule following (applying black letter law). CSR and good tax governance entail voluntarily going beyond the mandatory tax obligations. The substantive element of good tax governance concerns the amount of tax that a company pays and companies should avoid morally irresponsible tax behavior and strive to comply with the spirit of the law. The procedural element of good tax governance concerns public tax transparency. Both should be an expression of an internal moral commitment, rather than a calculated response to external pressures.

wealth and income that humankind has experienced in the past 200 years or so. McCloskey estimates that the total income generated by humankind has increased by roughly 5000% (McCloskey 2006, 15–16). The Great Enrichment is not just about increased wealth; it also includes dramatic improvements in life expectancy, health, and literacy, plus decreases in infant and child mortality. Humans have even become taller. McCloskey attributes the Great Enrichment to capitalism, though not primarily to the accumulation of capital. The essential feature of capitalism that caused the Great Enrichment is for her the rise of a large bourgeoisie that embraces the bourgeois virtues. She has reasons for choosing these terms, but “a large middle class with middle-class attitudes” might indicate the gist of her view.

This entry does not attempt a critique of McCloskey, but rather considers the Great Enrichment as a concept and as a phenomenon. Sources other than McCloskey are cited to indicate the vast amount of evidence that exists for the Great Enrichment – McCloskey could not possibly cite it all. This entry will also comment on McCloskey’s theory of what is causing the Great Enrichment, as well as mentioning other possible causal factors.

## Great Enrichment

## Introduction

The Great Enrichment is a term that Deirdre McCloskey gives to the dramatic increase in

## Evidence for the Great Enrichment

The Great Enrichment began about 200 years ago in “the West” – that is, in Britain and the USA/Canada and, soon after, in Western Europe. Several aspects of the Great Enrichment had begun earlier, such as the expansion of European trade (fifteenth to sixteenth centuries), modern science (seventeenth century), and industrialization (eighteenth century), but the benefits of these developments in terms of wealth and improved lives were not apparent until the early to mid-nineteenth century. Since then, the Great Enrichment has spread to Japan (late nineteenth century), Korea, Taiwan, and other parts of Asia (twentieth century). It is currently spreading to China, India, South America, Indonesia, and other areas (late twentieth and twenty-first centuries). Sub-Saharan

Africa is the last large area to experience the Great Enrichment, but there is evidence it has now started there. In short, the Great Enrichment is fast becoming global.

To quickly cite some of McCloskey's estimates, she points out that worldwide human population grew by a *factor* of 6 between the years 1800 and 2000 (2006, 15), the fastest by far in 250,000 years of human history. At the same time, consumption per person worldwide rose by a factor of about 8.5 (2006, 16), and in some countries, such as France, the USA, and Hong Kong, consumption per person rose by a factor of 19 or so. Not only were there more people who were much richer, they lived much longer too: "... expectation of life at birth in the world went from roughly 26 years in 1820 to 66 years in 2000" (2006, 18). Infant, child, and maternal mortality rates dropped spectacularly. McCloskey cites many other figures to support her case. It is clear the Great Enrichment happened, it happened quickly (in terms of humankind's history), and it represents something spectacularly different from anything in the previous 250,000 years *Homo sapiens* have been on this planet.

McCloskey is not the only one to emphasize this great event in human history. For example, William Nordhaus (2016) approvingly cites DeLong's calculations from DeLong's widely used textbook *Macroeconomics* (2004):

According to the economic historian Bradford DeLong, from the first rock tools used by humans three million years ago, to the earliest cities ten thousand years ago, through the Middle Ages, to the beginning of the Industrial Revolution around 1800, living standards doubled (with a growth of 0.00002 percent per year). Another doubling took place over the subsequent period to 1870. Then, according to standard calculations, the world economy took off.

Nor has the Great Enrichment stopped. In the past few decades, huge progress has been made in increasing the standard of living for hundreds of millions of people throughout the world.

For example, from 1990 to 2016, the percentage of people living in extreme poverty was reduced from roughly 1 in 3 to 1 in 10 (World Bank, 2016). Between 1960 and 2016, worldwide life expectancy increased from 52 to 72 years, and

infant mortality declined from 132 to 32 per 1000 live births. According to World Bank figures: "There were almost 1.1 billion fewer people living in poverty world-wide in 2013 than in 1990, a period in which the world population grew by almost 1.9 billion. The total number of poor dropped from over 1.8 billion to 767 million during these years" (2016, 37).

One can dispute the exact numbers, but the phenomenon of the Great Enrichment is too large and sudden to overlook the general point.

## Causes of the Great Enrichment

Deirdre McCloskey expounds in four large volumes (McCloskey 2006, 2010, 2016; the fourth as of 2017 has not been published) her theory that the fundamental and essential cause of the Great Enrichment was the creation of a large bourgeoisie with bourgeois virtues. In general terms, this might be expressed as a large middle class with middle-class attitudes. Such a class forms the core of capitalism and is key to capitalism's creation of net new wealth. McCloskey includes in the bourgeoisies three subgroups: first, financial, executive, and managerial elites; second, well-educated professionals and knowledge workers (which she calls the "clerisy"); and third, entrepreneurs and the owner-managers of small businesses. Not included in the bourgeoisies are laborers and aristocrats, that is, those who must earn a living other than by knowledge and those who inherit enough wealth that they can choose not to work at all. Presumably, the disabled and others who rely on the welfare state are also not part of the bourgeoisies.

The virtues that McCloskey is talking about she discusses at books-length under the headings of the traditional virtues of love, hope, faith, courage, temperance, prudence, and justice. Summarizing her discussion is difficult, but central to it is bourgeois contempt for social hierarchies by "birth" and inheritance, respect for individual freedom, equality of respect for all individuals and of their human rights, respect for the rule of law, and trust of strangers – all of which allow cooperation and coordination over very large

populations. The bourgeoisies also value thrift, change, innovation, and entrepreneurship. They do not value equality of income and wealth, believing that economic inequalities have to do with a person's character and deserts and further believing that the solution to poverty is trade, inclusion in the economic system, and the production of goods and services that people need and are willing to pay for.

McCloskey, of course, acknowledges other factors that are part of the rise of capitalism, and other writers have suggested many more. Various people have suggested the rise of science, breakthroughs in technology, the development of legal systems that respect private property and enforce contracts, the end of feudalism, the rise of individual freedom, the division of Europe into many nations (which allowed inventors, entrepreneurs and merchants to migrate if persecuted), the European colonial expansion (including wealth extraction, slavery, and captive markets which gave Europe the capital to finance the industrial revolution), the rise of legal structures which gave rights to for-profit corporations, and so on – this list is nowhere near complete.

Historical causation is a very tricky philosophical issue. One theory insists that history is a complex system (in the technical sense of complex), that a normal concept of causation does not apply to complex systems, and that the best one can do is describe the factors and context of historical developments. However, in the case of the Great Enrichment, which factor or factors are essential and fundamental matters for two reasons. First, anyone with humane feelings wants the Great Enrichment to spread to currently poor countries where people suffer from destitution, poor health, illiteracy, and high infant/child mortality rates. If such societies are to escape poverty, then it would help to know the essential factors in enrichment. Second, such knowledge might help global capitalism and the Great Enrichment to survive; if we want to remain rich, we need to avoid the decline and collapse that has afflicted *all* other complex civilizations known to have ever existed.

Most of the causal factors of the Great Enrichment can be viewed as falling into one of three

categories: attitudinal factors, institutional factors, and material factors. McCloskey defends the first as fundamental. Development theorists often advocate the need for institutions such as independent legal systems which protect private property, enforce contracts, and allow the formation of businesses and corporations (e.g., Acemoglu and Robinson 2012). Marxists, of course, accept historical materialism, but there are other materialistic theories. Joseph Tainter (1988), for example, argues that all complex societies depend on their production of energy; greater complexity requires greater energy input. Agricultural societies can only harness the energy of humans and animals (both of which must be fed), and, like the Western Roman Empire, they collapse when they cannot fulfill their often-increasing energy needs. The ability of the Roman Empire to produce food energy declined due to soil erosion, climate change, declining population, too many farmers being drafted into the army, and the loss of Egypt's grain exports. McCloskey mentions and dismissed the claim that the Great Enrichment was caused by and is sustained by the discovery of how to produce vast amounts of cheap energy from coal, petroleum, and natural gas. Her argument is the curious one that carbon-based energy cannot be a key component of capitalism because the petroleum industry constitutes only 4% of GDP (2006, 34). However, it is precisely the cheapness (and vastness) of carbon energy that some people think makes the great wealth of capitalist societies possible; it is because a vast amount of energy is available for only 4% of GDP that frees up 96% of GDP for other things like consumer goods, education, the arts, and so on.

Whether virtueists like McCloskey or materialists like Tainter are right matters greatly to our future. If capitalist civilization runs out of cheap petroleum and natural gas (or cannot use them due to climate breakdown), then Tainter's theory predicts that our society will necessarily become less complex and hence much poorer. If McCloskey is right that virtues and attitudes are fundamental, then the loss of carbon-based energy will be just a glitch that entrepreneurs, inventors, and

businesses will quickly adapt to by finding new sources of energy or using less of it. She mentions a bountiful use of hydrogen fuel for desalination and transport as an example (2006, 34), though, in fact, hydrogen cannot be a source of energy, only a means of storing or distributing it.

Perhaps there is no way of establishing what is truly the fundamental cause of our great riches but to wait and see how capitalism fairs in the next few centuries. Only then will we know if the Great Enrichment is a new long-lasting aspect of humankind's history (like the invention of agriculture) or whether it is only a short blip that will soon end, as people such as John Michael Greer (2008) argue.

## Greenwashing and Machinewashing: An Ethical Account and Criteria for Identification

Peter Seele

Corporate Social Responsibility and Business Ethics, Faculty of Communication Sciences, Università della Svizzera italiana (USI), Lugano, Switzerland

## Synonyms

Algorithms; Corporate social responsibility; Digital ethics washing; Misleading communication; Robots

## Introduction

In corporate communication, the presentation of a favorable message is part of strategic communication and is thus part of the overall strategy of an organization. That is the case for market-relevant information as well as ethically sensitive topics, which only have a mediated or indirect effect on market strategies and may therefore be considered as part of non-market-strategy. This holds true for many different topics but one of the most visible and controversially discussed topics is sustainability and green and environmental issues: When the environmental movement gained momentum in the 1970s, "Green PR" emerged as a multibillion dollar industry. Soon after, the concept of Greenwashing emerged to identify misleading green communication. Scholars and

nongovernmental organizations (NGOs) came up with definitions (for an overview see Gatti et al. 2019) and hands-on criteria (for an overview see Zanasi et al. 2017).

With the rise of big data, algorithms, and artificial intelligence leading to a digital transformation of business and with society posing severe ethical challenges, a similar phenomenon emerged, called machinewashing (Obradovich et al. 2019) or more generally (digital) “ethics washing” (Metzinger 2019). In the following, this entry briefly describes the analogy (and differences) and proposes criteria for machinewashing adopted from the four Greenpeace criteria of greenwashing. Finally, it presents a theoretical account from a communication and business ethics perspective.

## Greenwashing: Definitions and Criteria

Both greenwashing and machinewashing fall into the category of misleading communication. More specifically both phenomena are part of the gray zone between legitimate and illegitimate misleading communication but are usually not understood to be illegal (Gatti et al. 2019). If misleading communication was intentionally incorrect, this would lead to legal action and possibly sanctions. Greenwashing and machinewashing instead are misleading but not outright lies. Bowen calls greenwashing a “special case of ‘merely symbolic’ in which firms deliberately manipulate their communications and symbolic practices so as to build a ceremonial façade” (Bowen 2014: 33). Identifying this façade as greenwashing, however, depends on the recipient’s perception. Therefore, the phenomenon lies in the eye of the beholder and can be seen as “co-creation of an external accusation toward an organization with regards to presenting a misleading green message” (Seele and Gatti 2017: 239). As such, it depends on the ethicality and degree of the misleading message on the one hand and on the other hand on the tolerance of the audience to be greenwashed – or to speak up. As diffuse as individual perceptions may be, different organizations came up with criteria on how to identify greenwashing, among them nongovernmental organizations (NGOs) like Greenpeace or consultancies

like TerraChoice. As the consultancies focus more on how to detect and prevent greenwashing, the four criteria by Greenpeace are not only the oldest criteria but also clearly state, which transgressions can be considered greenwashing. As the original Greenpeace webpage is not online anymore, the criteria are still well documented in scholarly literature. In the following, the four Greenpeace criteria of greenwashing are referenced following Zansi et al. (2017: 65).

1. *Dirty Business*: touting an environmental program or product, while the corporation’s product or core business is inherently polluting or unsustainable. For example, if a company brags about its boutique green R&D projects but the majority of spending and investment reinforces old, unsustainable, polluting practices.
2. *Ad bluster*: using targeted advertising and public relations campaigns to exaggerate an environmental achievement in order to divert attention away from environmental problems or if it spends more money advertising an environmental achievement than actually doing it. For example, if a company were to do a million-dollar ad campaign about a clean-up that cost less.
3. *Political spin*: advertising or speaking about corporate “green” commitments while lobbying against pending or current environmental laws and regulations. For example, if advertising or public statements are used to emphasize corporate environmental responsibility in the midst of legislative pressure or legal action.
4. *It’s the law stupid!*: advertising or branding a product with environmental achievements that are already required or mandated by existing laws. For example, if an industry or company has been forced to change a product, clean up its pollution, or protect an endangered species, then uses PR campaigns to make such action look proactive or voluntary.

The criteria still give a good background to assess if a certain communication, behavior, or message may be perceived as greenwashing. Needless to say that individual perception and dialogue among stakeholders still may identify

green messages as greenwashing, even if they do not fall into one of the categories. Given the maturity of the greenwashing debate coupled with the urgency of environmental issues, regulation on both softlaw and hardlaw level have emerged. Emission standards, reporting guidelines, and directives or guidelines and policies on human rights have been proposed and several countries have made ethical issues dealt with in Corporate Social Responsibility a legally binding and mandatory compliance exercise. This transition from voluntary to mandatory makes Greenwashing less likely, and therefore the passage to the newly emerging topic of Machinewashing may benefit from looking at Greenwashing and adopting criteria to identify Machinewashing.

### **Machinewashing: Existing Definitions and Criteria, Derived from Greenwashing**

With the rise of digital technology, big data, and artificial intelligence transforming both business and society at large, the call for ethical reflection and responsible use of digital technologies became louder and louder. Cases of AI bias, discrimination, surveillance technology, and dehumanization triggered organizations and policymakers to issue statements, guidelines, or advertisements on digital ethics. Scandals involving racist algorithms, violations of privacy, mass surveillance, disinformation campaigns, or the erosion of the welfare state through the gig-economy and proprietary platforms created awareness and concern about the ethicality of digital technologies and particularly artificial intelligence. The embellishing and exaggerated responses of organizations, which were sometimes also misleading, led to the creation of the term “machinewashing” in analogy to greenwashing. In 2019 a first definition was presented in a newspaper presenting the new concept as a new form of greenwashing, used to “[a]ddressing widespread concerns about the pernicious downsides of artificial intelligence (AI) — robots taking jobs, fatal autonomous-vehicle crashes, racial bias in criminal sentencing, the ugly polarization of the 2018 election — tech giants are working hard to

assure us of their good intentions surrounding AI. But some of their public relations campaigns are creating the surface illusion of positive change without the verifiable reality. Call it ‘machinewashing’” (Obradovich et al. 2019).

In addition, Peukert and Kloker argue that in AI ethics washing one additional element comes into play, which is not the case in traditional greenwashing: “the goal of avoiding strict regulations — since regulations could, indeed, harm the overall business model — by actively engaging in public debates on sustainable and ethical use of AI and by trying to keep them running” (Peukert and Kloker 2020: 4). Given the overlap based on the inconsistency between surface and general behavior, machinewashing research may benefit from taking a cue from greenwashing. There is a strong similarity between the two concepts as organizations aim to present themselves in a more favorable way to stakeholders given the potential harmful (side) effects to the environment (greenwashing) or to society and individuals (machinewashing). In the following, it is proposed to adopt the greenwashing criteria from Greenpeace in machinewashing, as aspects of governance, credibility of words and deeds, or harmfulness of activities invite for a structural analogy. It needs however to be said that the analogy also has limitations, as green and machine issues still differ in some regards, for example when it comes to application levels or harmfulness to future generations.

Based on the Greenpeace criteria the following adoption is proposed:

1. *“Unethical Business”*: *touting a digital ethics program or ethical product, while the corporation’s product or core business is inherently in conflict with ethical principles such as equality, trustworthiness, non-discrimination, or fairness.* This criteria is particularly at the gravity center of the critique of the large digital platform companies. Criteria 1 may also be seen as “ethics washing” (Metzinger 2019) or “surveillance capitalism” (Zuboff 2019).
2. *“Ad bluster”*: *using targeted advertising and public relations campaigns to exaggerate an ethical achievement in order to divert attention away from digital ethics problems or if it*

*spends more money advertising a machine ethics achievement than actually doing it.* Some of the large digital platform companies have their own recurrent news magazines, available for free and added as inlays to quality journalism outlets. They look like independent publications, but are actually “advertorials.” In any case, the imprint and responsibility lie with the company, not the journalist or the outlet through which they are distributed.

3. *“Political spin”: advertising or speaking about corporate digital ethics commitments while lobbying against pending or current laws and regulations to govern digital technology.* This is the most important criteria, also as it marks the main conceptual difference to greenwashing, as machinewashing has the main purpose of preventing upcoming legislation. More in the exemplary chapter below on this criteria and the case of Facebook (Schaake 2021).
4. *“It’s the law, stupid!”: advertising or branding a product with achievements that are already required or mandated by existing laws. For example, if an industry or company has been forced to change a product or service, then uses PR campaigns to make such action look proactive or voluntary.* A technique equally relevant for green- and machine- washing, as both domains are subject to legal frameworks and updated legislation. What is legal emission thresholds for greenwashing is data-protection and privacy for machinewashing, particularly as the business model of digital platform companies is based on the exploitation of private data and its commercialization, trade, and sometimes trafficking.

Given the analogy of the two concepts (Obradovich et al. 2019; Peukert and Klokner 2020) the overlap is largely congruent. However, given the technical advancement and sophistication of the digital transformation, one more criteria is proposed, which may be understood as a sub-criteria to no. 1 “unethical business” but deserves to be put into the spotlight as it is a driver of the ethical crisis and mistrust though legally compliant:

5. *“Keep the cookie crumbling”: third party add-ons as smokescreen so the respective company may say they do not listen directly or apply surveillance of the private sphere.* Legally compliant, particularly with the new “General Data Protection Regulation” (GDPR) of the EU, but morally questionable and part of machinewashing is the technique to communicate, that companies do not spy on their users and exploit private data unrelated to the service in order to collect data and profile consumers. At the same time, it is possible that the companies own or collaborate with a legally independent external or even internal (by ownership structure) entity that sets a “cookie,” an add-on to a software or app, collecting the kind of data, the company does not dare to collect (anymore) (Seele and Zapf 2020: 130–132). This technique leads to the so-called incognito illusion among users and may be considered a highly invisible, legally compliant but ethically questionable trick of machinewashing.

The five criteria are meant to be an indicative guideline to identify specific cases of machinewashing. Meeting a single Greenpeace criteria qualifies as greenwashing. The same holds for machinewashing. The Greenpeace “pillory” however is not without limitations and problems. Building on more recent greenwashing research, it may be added here, that also machinewashing is co-created (Seele and Gatti 2017) by the misleading communicator and the entity blaming the misleading communicator of greenwashing. This eye-of-the-beholder concept of greenwashing is equally important as it also allows for processual changes in the perception of what is morally legitimate to communicate, and where the label or “stigma” of machinewashing comes into play.

### **On the Example of Political Spin and the Overall Impact on Democracy**

The analogy between greenwashing and machinewashing on the conceptual level – as likely as it may be – would not hold if there

weren't any tangible examples indicating the strong overlap. As has been seen in the contribution of Peukert and Kloker (2020) building on the original Metzinger (2019) argument, a novel and unique dimension of machinewashing compared to greenwashing is linked to regulation, respectively the prevention of mandatory regulation. Just as in the Greenpeace criteria "political spin" is a key criteria, so is the "forked tongue" with digital platform companies. Schaake (2021) in a Financial Times opinion piece describes, how "Facebook executives are calling for more regulation, while simultaneously pushing to get the US's top regulator, FTC [Federal Trade Commission] chair Lina Khan, recused" and she concludes, that "Silicon Valley says it wants more oversight yet does little to promote it in practice" (Schaake 2021). As established in greenwashing, also in machinewashing the "blame game" (Pizzetti et al. 2019) of why a company does not act in a certain way but voluntarily demands stricter regulation, while at the same time lobbying against stricter regulation is at the center of the ethical controversy around machinewashing. When Schaake demands: "It is time the debate about regulating technology reached a more sophisticated and substantial level" (Schaake 2021), then the way to achieve this goal is also to reduce machinewashing as a disinformation strategy, which in the long run also undermines deliberative democracy. Greenwashing and machinewashing therefore are not only relevant in a business and professional ethics perspective but also contribute to the overall political role of corporations as well as threat to open societies and markets. In a Habermasian terminology, machinewashing belongs to the category of strategic action and enters into the gray zone of unethical and questionable, but not necessarily illegal behavior. Therefore the participation in a discourse about machinewashing among various stakeholders is essential to fight it. The criteria may help to navigate the often blurred lines and camouflaged tricks and techniques, particularly since algorithms and the digital world, in general, are not as easily accessible and understandable.

## Guanxi

Zhenzhen Li

School of Management, Department of Business Administration, Fudan University, Shanghai, China

## Synonyms

Social relationships

## Definition

“Guanxi” is a general Chinese term used to describe the relationships that may result in exchanges of favors or “connections” which are beneficial to the parties involved. It exists among people who may have a commonality of shared identification, such as their locality or dialect (tongxiang), fictive kinship (people sharing the same last name), kinship (immediate family), work place (tongshi), and friendship (Wu and Chiu 2016). People can build up their social network through guanxi (Luo 2009). Guanxi generally refers to informal personal connections through which individuals engage in reciprocal expectations and obligations to facilitate the mutual exchange of favors (Chu et al. 2019). Guanxi usually involves three subdimensions, including ganqing (affection, emotional bonding), renqing (the reciprocal exchange of favors), and xinren (interpersonal trust) (Kipnis 1997; Yen et al. 2011). Guanxi can occasionally result in corruption, as it often involves the exchange of favors, which is expected to happen regularly and voluntarily. The Chinese guanxi approach is established and nurtured at the individual level through increasing levels of ganqing, renqing, and xinren, which differs from the Western management traditions that emphasize systems of trust and commitment at the organizational level (Yen and Abosag 2016; Chu et al. 2019). Guanxi is a crucial system of beliefs which helps businesses to secure better positions and competitive advantages, and has great value in all kinds of social

contexts on the Chinese mainland and even across Southeast Asia.

## Description

Guanxi literally means “connections” or “relationships,” and refers to any type of relationship, but it also has a deeper level of meaning in Chinese culture, and can be understood as referring to the social network of relationships among various groups that support each other. To some extent, the reason why we use the pinyin romanization of this Chinese term widely in the West is that its common translations, such as “connections” and “relationships,” fail to reflect the wider cultural implications underlying guanxi.

The concept of guanxi plays a vital role in everyday life in China and shows us a particular image of society. Sometimes, the interests of both individuals and the group are tied together through guanxi. The whole of society can be considered as a hierarchically structured order, covered by an interlaced network of relationships. Many situations in which people take actions based on guanxi prevail in China. Many Chinese people like to obtain information, like whom one knows and to which group or work unit one belongs, rather than basing their judgments on a person’s outward appearance and behavior (Luo 2009). One can achieve one’s goals more easily if one makes the most of human relationships. Thus, many outsiders of the circles of personal and mutual trust often need to devote time and effort to making and exploiting contacts. A famous instance is the retail success of Samsung in China, a company that manages to provide good product access to Chinese consumers by collaborating with the top three mobile operators and establishing good guanxi with small local Chinese retailers (Yen and Abosag 2016).

It is worth pointing out, however, that not all interpersonal relations are labelled guanxi. Relations between family members or couples are based on their mutual obligations, so guanxi is not generally used to describe the interpersonal relationships existing within a family, even though guanxi obligations can sometimes be

described in terms of an extended family. An individual (A) may interact with another person (B) in a similar way to how he interacts with their family members, for example, and A may fraternize with B, sharing mutual consideration and exchanging gifts with each other.

Different from the Western management traditions, that emphasize systems of trust and commitment at the organizational level, guanxi is based on personal connections, such as exchanging favors, cultivating personal relations, and ganqing (sharing affection) (Chu et al. 2019). Closely related concepts include ganqing (affection, emotional bonding), renqing (the reciprocal exchange of favors), and xinren (interpersonal trust) (Kipnis 1997; Yen et al. 2011). At times, the practice of using one's guanxi can be regarded as an art (Chen 2001). It often involves favor exchange, gift giving, visiting, socializing, wining, dining, and karaoke, with the aim of increasing the elements of ganqing, renqing, and xinren with one's respective business partners (Yen and Abosag 2016), but corruption and bribery are not the best practices for giving favors or increasing reciprocity, as Fan (2002) demonstrated. Thus, most people will avoid such under-the-table exchanges.

### The Reason for Guanxi

Guanxi relationships have always played an important role in traditional Chinese culture; for example, guanxi sees the individual as part of a community and a set of family, hierarchical, and friendly relationships in Confucian culture.

However, guanxi is neither a “typically Confucian” nor a “typically socialist” concept (Luo 2009). Luo (2009) claimed that the main reason why people pursue guanxi is that they expect to reduce the social uncertainty in this manner, particularly political and legal uncertainty. Chen et al. (2011) also argued that guanxi may also be effective for managing dependency and mitigating uncertainty. People seek security and trust through guanxi relationships not only in the political arena but also in the private sphere. It should be interpreted as a principle on which society is organized, that is explicable in both cultural and political terms (Luo 2009). It can provide an important

tool for enabling social groups or communities, individuals, and parties to contact and communicate with each other. It can also help to ease the reciprocal bargaining processes and lead to decisions that otherwise would not be taken or only partially reached.

### Guanxi Between Two Strangers

In general, two persons need to exchange something, like opportunities for profit, access to some scarce resources, and so on, if they wish to take advantage of the guanxi between them. If no connection exists between yourself and someone who is able to help you in some way, you may need to set up or create such a link through various channels.

Say, for example, there are three people: Alan, Bob, and Cindy. Alan wants something from Cindy but is upset because he lacks guanxi with Cindy. Fortunately, Alan and Bob are friends, which means that Alan has Bob in his relationship network. Bob knows Cindy and has guanxi with her, so Alan asks Bob to contact Cindy. In order to help Alan, Bob turns to Cindy, and Cindy wishes to do Bob a favor and chooses to help Alan because of the guanxi existing between him and Bob. In this way, Alan creates a connection with Cindy. If all goes well, Alan can develop a new guanxi with Cindy, too. Bob acts as the intermediary in creating an opportunity for Alan to build up guanxi with Cindy. Thus, guanxi plays a vital role in the form of social investment and can be seen as a relationship between people or institutions based on exchange, with a mutual understanding of the rights and obligations of both parties (Luo 2009).

### Guanxi Web Maintenance

Usually, guanxi refers to the benefits arising from social connections. There may exist various people, such as family members, classmates, workmates, people from one's hometown, or members of the same club in one's guanxi web (Luo 2009). At times, one may spend a lot of time and money cultivating a complicated guanxi web, just in case one needs it later. Reciprocal favors are the key factor in maintaining one's guanxi web, while a failure to reciprocate is considered unforgivable

and will lead to the curtailment of all future investment. Ideally, guanxi can perpetuate a never-ending cycle of favors.

What are these reciprocal favors, then? Actually, setting up and maintaining such close relationships is not only based on direct cash exchanges or the direct giving of gifts, at least not exclusively. At times, a dinner or conference can provide an environment for widening one's circle of acquaintances and developing new relationships. Guanxi transactions are often hidden and not made obvious to the casual observer. An exchange of favors or "inside information" may amount to good guanxi, but not all guanxi is good guanxi. Connections built on guanxi can quickly fade or disappear if part of the "relationship chain" is called into question for any reason.

### Guanxi Circle

A guanxi circle is an ego-centered network. Core members have pseudo-family roles that tie them to the centered ego of a guanxi circle (Luo et al. 2016). Outsiders, or out-group members, include people connected by acquaintance ties as well as strangers (Luo et al. 2016). Guanxi circles are in some ways akin to familiar center-periphery images of networks – layers in the "social atom" around a person, or an "inner circle" of business elites (Burt and Burzynska 2017).

Specifically, the inner ring of guanxi circle applies "need rules" in which family ties are used to more or less satisfy each other's needs without asking for return (Burt and Burzynska 2017). Then the circle is expanded to a middle ring which is composed of a person's good friends. These people are connected by long-term favor exchanges, where both parties combine expressive and instrumental exchanges and carefully maintain trustworthiness under the principle of reciprocity (Burt and Burzynska 2017). Beyond the middle ring are acquaintances on the periphery, where instant return and bargaining in social exchanges are allowed (Burt and Burzynska 2017). Beyond the periphery boundary there are no rules and trust.

### Guanxi's Embeddedness in the Business Environment

Guanxi occurs first through individual interactions before being applied at a corporate level. Unlike Western business relationships at the organizational level, the Chinese guanxi approach is established and nurtured at the individual level by increasing the levels of ganqing, renqing, and xinren, often between key relational personnel, such as sales representatives and procurement buyers, on behalf of the firms that they represent (Yen and Abosag 2016). A simple instance is that one person may do a favor for another person from a different business organization because of their interpersonal connections (Gu et al. 2008). Thus, this interaction can facilitate the relationship between the two business organizations. To some extent, we may argue that guanxi can act as an essential informal governance mechanism, helping to leverage Chinese organizations on social and economic platforms.

Hsiung (2013) pointed out that there are two domains in which guanxi plays an important role. One is the social ties with the managers of the suppliers, buyers, competitors, and other business intermediaries. The other one is the social ties with government officials, which may help corporates to attain certain invisible resources. From the perspective of the resource-based view, guanxi can be regarded as a crucial source of social capital for business success, given its extensive influential power in shaping business operations. The stronger a relationship, the more social, political, and economic use can be made of it, and so the more social capital it has.

Otherwise, guanxi also works widely inside organizations (Luo 2009). Specifically, the superiors are responsible for hiring, promotion, rewards, punishment, and evaluation of political attitudes and therefore can determine the whole life and career of their subordinates in China. Chinese people are encouraged to create an authoritarian culture, with relationships based on personal loyalty. Thus, guanxi is particularly important because it helps to ease certain material problems, and political careers and

promotions depend on connections with leading functionaries.

### Political and Commercial Guanxi

Although Chinese people are trying to minimize the impact of local government, it is still the most important stakeholder in China's corporates. Political guanxi can sometimes help companies considerably. Specifically, key government officials wield the authority which means that they can choose their political associates and allies, approve projects, allocate resources, and distribute finances. Thus, maintaining a good relationship with government officials is of great importance for many companies. What is more, the Chinese government owns vital resources, including land, banks, and major media networks, and it also has a great influence on other stakeholders, too. Firms with close political connections and government involvement may have more access, than those that do not, to technical and market information that will improve product performance (Zhang and Hartley 2018). However, guanxi with government officials has been shown to have a negative relationship on resources, capabilities, and the ability to adapt (Chen and Wu 2011). Moreover, the line between ethical and unethical reciprocal obligation is unclear, so guanxi may be regarded as a form of government corruption and is easily questioned.

### The Ethical Consequences of Guanxi

Hwang et al. (2009) pointed out that guanxi can lead to ethical concerns, if one does a favor for another person without seeking anything in return. That is to say, guanxi is often connected with negative phenomena, like bribery and corruption. Why so? At times, individuals depend heavily on their close relations and friends unconsciously because the boundary between business and social life can sometimes be ambiguous. In fact, many people, both Chinese and expatriates, hold negative stereotypes about the use of guanxi, even though many people continue to use it in the dealings with each other. Guanxi can even be

viewed as nepotism, and people may scorn someone because he is incompetent and always achieves his goals through guanxi. Further, businessmen may regard guanxi's reciprocal obligations as unethical gift giving in exchange for government approval.

Meanwhile, others hold the belief that guanxi is entirely ethical. Many people misunderstand guanxi's implications because they lack knowledge about Chinese culture. As Lovett et al. (1999) claimed, any relevant actions for maintaining guanxi are recognized as working within ethical constraints. Thus, it is simply a tool that allows people to maintain their interpersonal relationships, which may be regarded as a moral obligation.

However, as Luo (2009) stated, the two phenomena of guanxi and corruption/bribery are similar but not identical because the social and ethical concepts behind them differ. In fact, guanxi is often a question of personal emotions because it is based on real or imagined things that are shared in common. An individual may be prepared to do a favor for someone on his own terms. A gift or favor is simply a tool for maintaining and deepening relationships, which is totally different from corruption/bribery. Guanxi is a neutral word, but the use or practice of guanxi can range from benign, neutral, to questionable and corruptive (Fan 2002). In Chinese people's opinion, guanxi is an aspect of interpersonal relationships and often involves a moral obligation. Thus, we need to distinguish the unethical usage of guanxi from the concept of guanxi itself.

In summary, guanxi can often help Chinese people to reduce the uncertainty in their life, and it is often misused and regarded as unethical actions in many situations. What must be acknowledged, however, is that guanxi is doubtlessly a critical part of Chinese culture.

## Harassment in the Workplace

Clive R. Boddy

Tasmanian School of Business and Economics,  
University of Tasmania, Hobart, TAS, Australia

### Synonyms

Abusive supervision; Mobbing; Workplace bullying; Workplace victimization

### Definition

Workplace harassment is the repeated, offensive, and emotionally upsetting treatment of employees by others at work. Harassment can be delivered verbally in person, face to face through spoken suggestions or unwelcome touching, or nonverbally without contact via body language or the use of silence, or by other means such as through electronic communications like e-mail and text messages. It can include harassment of a sexual nature such as regular and undesired sexual advances where refusal can bring disadvantages to the person being harassed or the promise (but not necessarily delivery) of rewards to those who give in to the demands of the harasser. The experience of dealing with such unwanted and hard to avoid sexual approaches from colleagues is reportedly common among female employees.

Harassment can also be focused on ability, racial, ethnic, religious, sexuality, and other personal differences and can include the making of derogatory comments or insulting remarks based on these differences. Harassment can include pestering, provoking, intimidating, molesting, and attempting to coerce people via unpleasant conduct. The harassment is perceived as an attack by the victim who can be worried, belittled, embarrassed, humiliated, fatigued, and distressed by the repeated pestering of the harasser. Harassment interferes with a victim's ability to undertake their job or can involve the threat of dismissal if the harassers' demands are not met. The use of derogatory jokes, offensive wall posters, and sexual or negative stereotypical remarks constitutes harassment, especially when these are used simultaneously. Where harassment is undertaken jointly by the members of a work group, with for example, the intention of forcing someone out of an employment position, then this may be known as mobbing. Such activity may also be called group bullying, and it utilizes overt or subtle techniques such as yelling as well as more subtle techniques such as gossip, innuendo, discrediting misinformation, and social isolation, to achieve its objectives.

One of the early writers on harassment, Brodsky identifies one of the causes of workplace harassment as being from other people in the workplace, with the two other sources being from work pressure and from the organizational system. Brodsky

identifies that workplace harassment from other people is usually related to attempts to control the person being harassed (Brodsky 1976). Workplace harassment is thus linked to power imbalances where the person in the more powerful organizational position attempts to coerce or pressure the less powerful employee into doing something. Tactics used can include the blocking of workplace opportunities, abusive supervision, and frequent criticism of the employee being harassed. Such harassment is typically aimed at gaining submission or acquiescence from those being harassed.

## Description

After reviewing the literature on workplace harassment, bullying, and mobbing, Branch, Ramsay, and Barker conclude that the terms “harassment” and “mobbing” are frequently utilized as descriptors of workplace bullying behavior. Harassment can be called mistreatment at work, workplace abuse, workplace aggression, and workplace mobbing and can be aimed at individuals or at groups of employees whose members typically share a common characteristic which the harassers use as a basis for the attacks. Activities deemed to be harassing include humiliating and mistreating others, aggression, social exclusion, and unjust treatment, and these are also commonly found in definitions of workplace bullying. Whether there is any meaningful difference between harassment and bullying, especially from the victim’s point of view, is a moot point. Increasingly, “workplace bullying” tends to be the most consistently used term among academic researchers (Branch et al. 2013).

Recent research has shown that the Dark Triad traits (psychopathy, narcissism, and Machiavellianism) have unique positive associations with the proclivity to indulge in sexual harassment (Zeigler-Hill et al. 2016). This corresponds with corporate psychopathy research which also demonstrates a strong link between managers displaying the characteristics of psychopathy and the regular, frequent, and repetitive bullying of employees. Harassment has been linked to

reduced job satisfaction and lessened team cohesion and well-being, lower financial performance and lower employee commitment to the organization, reduced citizenship behavior, and increased withdrawal from work. Harassment also corresponds with physical and mental ill-health, stress, and increased intention to quit one’s job, and further, it is prevalent among professionals (Laband and Lentz 1998; Raver and Gelfand 2005).

In summary, workplace harassment is associated with a range of negative outcomes at the individual, group, and organizational levels. Individual victims can suffer from symptoms similar to those found in post-traumatic stress disorder such as depression, low self-esteem, sleep disorders, anger, shame, and guilt. Individual effects can also include reduced well-being, lower employee job satisfaction, lower employee commitment to the organization, more employee withdrawal behavior, as well as employee absenteeism and turnover (attrition). Group effects can include lowered team effectiveness and increased organizational inefficiencies, as well as loss of team expertise as people disengage with or exit the organization.

The idea or conceptualization of harassment varies between different countries and cultures. However, in many countries, harassment activities are illegal, especially when based on discrimination due to race, sex, gender, sexuality, disability, or ethnic origin and especially when delivered frequently and severely. Often in these countries, employers have a responsibility to treat all employees and potential employees fairly and without discrimination. Where such harassment or discrimination exists then employees often have a legal recourse.

## Has the Mainstreaming of Responsible Investment Eroded Ethics? Insights from Investor Advocacy on Human Rights in Conflict Zones

Priya Bala-Miller  
Department of Political Science, University of  
British Columbia, Vancouver, BC, Canada

## Synonyms

Conflict zones; Corporate social performance; Ethics; Human rights; Responsible investment

## Introduction

By many accounts, the responsible investment story that has unfolded over the last two decades is impressive. The sector has seen staggering growth in the volume of assets being managed in line with responsible investment principles (GSIA 2017), and investor participation in sustainability-oriented networks continues to widen and deepen.<sup>1</sup> Nonetheless, these laudable gains in

mainstreaming responsible investment have not precluded scholars and practitioners from pointing out that, aspirational commitments aside, forceful action by investors on pressing sustainability challenges remains elusive. These critiques have particularly resonated with regard to the social dimensions of responsible investing. As Louche and Hebb (2014) argue, the industry's focus on the technicalities of integrating sustainability issues or related financial impacts, though important, has been self-limiting to the point where the societal impacts associated with responsible investing have been too often neglected or ignored. For these scholars, an antidote for the neglect would be to recover the responsible investment movement's impetus for action on ethical concerns by requiring investors to exercise active judgment, to think and reflect on the way investment creates (or destroys) value for society.

This chapter explores the specific issue of how investors respond to human rights issues in conflict zones (HRICZs) as a vehicle to contextualize both the validity of Louche and Hebb's critique and the implications for their proposed ethical recovery in the context of investment decision-making. I begin by clarifying the chapter's scope and key terms. To contextualize the analysis, I then briefly outline the drivers for investor advocacy on HRICZs, distinguish between ethical and instrumental logics that have historically underpinned these advocacy efforts, and review the strategies investors have deployed toward this end. My analysis then identifies how the mainstreaming of responsible investment has simultaneously eroded institutional capacities for ethical deliberation by investors on HRICZs. Looking ahead, the chapter concludes by proposing strategies that could enhance the ethical foundation and social impact of future investor action on this issue.

<sup>1</sup> Examples include the UN-backed Principles for Responsible Investment and variety of regional sustainable investment industry associations such as the Institutional

Investors Group on Climate Change, the Sustainable Stock Exchanges Initiative, the Farm Animal Investment Risk and Return Initiative, and the Asset Owners Disclosure Project.

## Scope and Key Terms

The chapter's scope is limited to institutional investors that typically hold large pools of capital in diversified investments with long-term investment horizons, across asset classes, sectors, and geographies. The term *responsible investor* refers to asset owners who are committed to including a broad range of sustainability issues within their investment-decision-making processes and who employ a wide range of approaches to implement this commitment in portfolio allocation and management. Mirroring its use in practice, I use the term *human rights* in the context of corporate compliance with established global human rights norms and standards.<sup>2</sup> The term *conflict zone* covers a broad range of political and geographic contexts. It may include areas that are experiencing violent armed conflict (civil war, armed insurrection, interstate war, and other forms of organized violence); regions that are not currently experiencing high levels of armed violence, but where political and social instability prevails and a number of factors make future conflicts very likely; regions where there are serious concerns about human rights abuses and the repression of political and civil liberties; and regions that are volatile but are transitioning toward peace (UNGC and UNPRI 2010).

## Drivers of Investor Action on HRICZs

A number of trends in the global political economy make HRICZs a bellwether social issue for institutional investors. First, as universal owners, institutional investors cannot ignore risks that threaten the stability of the financial system as a whole (Hawley and Williams 2000). Every industry and asset class has some exposure to human rights risks that cannot be completely avoided

simply through portfolio diversification, thereby representing a systematic financial risk.

Second, emerging markets<sup>3</sup> are becoming an increasingly integral part of the asset mix for institutional investors, despite the fact that more than a third of emerging markets are experiencing active conflict.<sup>4</sup> Indeed, several of these economies – such as Colombia, Indonesia, and the Philippines – continue to attract high levels of foreign investment, suggesting that institutional investors favor other factors over the heightened human rights risk profile associated with companies that operate in fragile governance zones (Campbell 2004).

Third, against the backdrop of the increasing exposure to conflict-affected areas, global norms have recently evolved to clarify investor obligations on human rights. The most significant development in this area is the United Nations Guiding Principles on Business and Human Rights (UNGPs) which were unanimously endorsed by the UN Human Rights Council in 2011. The Principles confirm that institutional investors are expected to respect human rights in their own operations, as well as in business relationships with investee companies (Davis 2012). They also stress expectations for investors to ensure adequate due diligence measures for firms that operate in conflict zones (Davis 2012).

In a similar vein, revisions to the OECD Guidelines for Multinational Enterprises in 2011 extended the culpability for violations of terms to institutional investors. These policy changes have since been tested via the OECD's National Contact Point (NCP) complaint process. The NCP cases and subsequent findings established that responsibility to respect human rights applies

<sup>2</sup>Including, but not limited to, the International Bill of Rights, the International Labour Organisation's Core Labour Standards, UN Declaration on the Rights of Indigenous Peoples, OECD Guidelines for Multinational Enterprises, UN Guiding Principles on Business and Human Rights, and the IFC Performance Standards for Environmental and Social Sustainability.

<sup>3</sup>For this chapter, I have relied on the S&P Dow Jones Global Equity Index Series which uses three major country classifications: developed, emerging, and frontier. Qualitative and quantitative factors are used to determine a country's classification. Emerging markets are those which exhibit full domestic market capitalization of over \$2.5B, domestic annual turnover value over \$1B, and an exchange development ratio over 5%, along with a combination of additional criteria relating to debt settlement periods, sovereign debt ratings, hyperinflation, foreign ownership restrictions, and freely traded foreign currency.

<sup>4</sup>Based on cross-referencing the S&P Dow Jones Equity Index country list for Emerging Markets (2016) with Uppsala Conflict Data Program's (2016) list of active conflicts.

irrespective of the size of the investor's holding (including minority shareholdings) and regardless of how the transaction is structured (Wachenfeld et al. 2016). The NCP case also made clear that investors should establish clear management systems in order to systematically address human rights issues confronting investee companies (Wachenfeld et al. 2016). Taken together, the pervasiveness of human rights risks, increasing exposure to conflict zones, and evolving global norms make HRICZs highly salient for institutional investors seeking to balance social, environmental, and financial sustainability for the long term.

### Instrumental and Ethical Logics Guiding Investor Action on HRICZs

At this juncture, it is important to highlight that simply recognizing an issue as salient does not automatically mean investors will act on that issue. What bridges these distinct moments (recognition and action) in the advocacy trajectory is thoughtful deliberation by investment decision-makers. Conventionally, the logics guiding responsible investment decision-making have been distinguished based on whether they are primarily values-based (where ethical considerations take precedence) or value-based (where sustainability issues are addressed as a means to generate financial returns, sometimes referred to as the business case). In the context of HRICZs, investors have drawn on both forms of logic to justify their advocacy in this area.

#### The Instrumental Case

Several high-profile civil society campaigns on issues ranging from sweatshop labor in the 1970s to the more recent trade in "conflict minerals" have demonstrated how failing to adequately manage human rights issues can make firms less profitable. Financial theories have consolidated a business case for HRICZs by showing how this issue impacts key value drivers such as cost reduction, competitive advantage, reputation, and value creation (Kurucz et al. 2008). For instance, in 2011, a group of Chevron's shareholders objected to the company's decision to appeal findings by the Ecuadorian Provincial Court that the company was held liable for

\$18 billion in damages for polluting vast areas of the Amazonian rainforest from oil drilling and its waste products (Investor Statement on Aguinda v. Texaco 2011). Instead of incurring further reputational harm and the costs of protracted litigation, shareholders called on Chevron to re-evaluate whether a more productive approach such as reaching an equitable negotiated settlement could be employed to protect shareholder investments. In this example, the instrumental logic adopted by investors conveys that the cost of investing in sound environmental and stakeholder management can offset the potential costs of addressing future community grievances and conflict escalation.

#### The Ethical Case

Moral reasoning, a systematic approach to making ethical decisions through logical argument and persuasion, offers an alternative to the business case. Here, international relations scholars working in the constructivist tradition are helpful in identifying variables that enable an advocacy issue to be successfully framed in ethical terms.<sup>5</sup> For example, Keck and Sikkink (1998) explain that ethically grounded advocacy campaigns are likely to be successful when they address norms against bodily harm to innocent individuals or norms that violate legal equality of opportunity for citizens. Between 1970 and 1990, the highly publicized accounts of harm meted out on Black South Africans by an oppressive government's structural policies of racial segregation and its resulting denial of opportunities aligned closely with these attributes. Using explicitly moral arguments pertaining to harm and equality, religious investors lobbied for corporate divestment and the liquidation of South African assets within their own denominations in an effort to relay their moral outrage against Apartheid (Ciocchetti 2008). Similarly, an ethically oriented influencing

<sup>5</sup>These include the attributes of advocacy issues themselves (Keck and Sikkink 1998); the presence of "norm entrepreneurs" to champion an issue (Finnemore and Sikkink 2001); a favorable norm pool into which a new issue may be aligned (Price 1998), as well as a number of conditioning factors such as the level of media attention, donor resources, frame availability and network politics (Carpenter 2007).

**Has the Mainstreaming of Responsible Investment Eroded Ethics? Insights from Investor Advocacy on Human Rights in Conflict Zones, Table 1** Investor approaches to human rights issues in conflict zones

|                         |                                                                                                                                              |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Asset selection</b>  | Political/human rights risk analysis and monitoring<br>Screening<br>Sanctions<br>Impact investing                                            |

strategy is more likely to be effective if the new norm builds on pre-existing norms – a process referred to as grafting (Price 1998). This form of moral reasoning has also been applied in instances where investments in the military-industrial complex have been banned by showing that such investments would violate an investor’s prior ethical commitments to pacifism (Ciocchetti 2008).

Recognizing that the reality of investment decision-making is more complex than an idealized binary between instrumental and ethical forms of reasoning, HRICZs nonetheless represent the “easy case” for investor advocacy precisely because a defensible rationale and historical template for action exist, regardless of whether a logic of value generation or values alignment dominates the investment decision-making process. Hence, analyzing how investors respond to a social issue that has a low “barrier to entry” serves as a litmus test for the overall quality of their approach to social issues.

### Strategies for Investor Action on HRICZs

Having established HRICZs as a salient and logically defensible subject for investor advocacy, this section of the chapter briefly outlines the strategies investors have used for this purpose within asset selection, asset management, and fund governance activities (see Table 1).<sup>6</sup>

<sup>6</sup>The section covers equity investments only, noting that more research and empirical data is needed on how human rights requirements relate to other asset classes such as fixed income and private equity.

### Political Risk Monitoring

Political risk analysis evaluates how political conditions in a particular market affect an investment’s value. This analysis can be targeted at the firm, industry, or portfolio level and addresses risks such as government instability, currency inconvertibility, nationalization, and expropriation – all of which are exacerbated under conditions of conflict. Although political risk models may not directly measure human rights impacts flowing from political risks, the market for such information is increasing. Investment managers not only use political risk metrics from large consulting and insurance companies, but they are also relying on data from international human rights NGOs, ratings agencies, and services that specialize in human rights due diligence.

### Screening, Sanctions, and Impact Investing

Additionally, investors have sought to limit their exposure to human rights violations through the application of ethical screens. For example, the Norwegian Government Pension Fund Global (GPF) is prohibited from investing in companies that are involved in serious violations of human rights, especially in situations of war or conflict (NBIM 2016). Furthermore, investors may be prevented from investing in conflict-affected areas due to political reasons. This was the case in Myanmar in the 1990s when the repression of prodemocracy movements by the military junta led to strict economic sanctions and the departure of many Western firms from the country (Soule et al. 2013). An alternative approach to “negative screening” and sanctions is impact-investing which encourages investors to drive capital

toward companies that positively contribute to peace and post-conflict reconstruction. Examples include targeted investments for firms that support clearing of landmines or job-creation initiatives for former combatants.

### Corporate Engagement and Divestment

Investors can exercise ownership rights to address HRICZs by engaging in private dialogue with investee companies, submitting shareholder resolutions and proxy votes to signal concerns or even divestment in cases where investor expectations for corporate human rights performance are not met. An illustrative case involves the ongoing conflict in Western Sahara. The region is home to the Saharawi people who dispute the Moroccan government's claim to their territory and the extraction of mineral resources by foreign companies. In 2016, shareholders filed proposals at two Canadian fertilizer companies (Agrium and PotashCorp) regarding their imports of phosphate rock from Western Sahara.<sup>7</sup> The proposals detailed investor concerns about human rights risks associated with operating in conflict-affected areas and requested the company to conduct and publish a human rights assessment of its activities in Western Sahara (SHARE 2016). Taking a different approach, a number of European investors chose to divest their shares in companies sourcing phosphate from Western Sahara (Western Sahara Resource Watch 2016).<sup>8</sup>

### Setting the Rules of the Game

In addition to establishing internal policies and governance mechanisms that address HRICZs, investors recognize that promoting sustainability also requires engaging with regulators on domestic legal and policy reform and providing input into global standards and rules. In the area of

HRICZs, investors have contributed their views on the implementation of the UN Guiding Principles on Business and Human Rights (Richardson 2014) and negotiations on the Global Arms Trade Treaty (Bâtirente 2011). More recently, in response to a possible suspension of the Conflict Minerals Rule for Section 1502 of the Dodd-Frank Act in 2017, investors have come out in support of the rule as a vital tool to advance peace and human rights (Investor Statement 2017).

### Analysis

Tracing an arc from early forms of social activism by a small group of religious investors in the 1970s, shareholder advocacy on HRICZs today involves a much broader universe of investors (with varying ethical commitments), who use diverse tools to engage stakeholders, states, and firms. Nonetheless, critical reflection provides some evidence that the mainstreaming of social shareholder activism has eroded rather than reinforced capacity for ethical reflection by investment decision-makers. This erosion is exemplified by structural choices shaping how the field of responsible investment is being consolidated domestically and internationally.

On the domestic front, recent developments in Norway are a case in point. In 2014, the Norwegian government announced its decision to restructure the Council on Ethics, the independent institution responsible for recommending ethically grounded investment exclusions of companies from the investment portfolio of the Norwegian Government Pension Fund Global (GPF). The change involved moving ultimate responsibility for addressing the Council's recommendations from the Norwegian Ministry of Finance to Norges Bank, the financial institution which administers the fund (Norwegian Ministry of Finance 2014). From the Ministry's perspective, consolidating all responsible investment activities within Norges Bank was meant to clearly signal that exclusions were immune from political influence and purely the result of restrictions governing asset management. However, critics were of the view that the restructuring

<sup>7</sup> As part of a broader campaign, the filings were accompanied by substantial efforts to highlight the issue in mainstream Canadian media outlets, investor webinars that featured prominent human rights NGOs working on the issue, and proxy-voting advisories encouraging support for the resolutions.

<sup>8</sup> This outcome may reflect the "home bias" in engagement, where investors prefer to engage domestic firms (see Bauer et al. 2013 for a broader discussion of this idea).

effort would consolidate too much decision-making power within the central bank and that reduced openness could constrain broader social debate on the human rights implications of the fund's investments (Woodgate and Berglund 2014). This approach appears to strive for a strict separation of state, market, and civil society spheres, rather than viewing markets as politically and socially embedded.

The consolidation of responsible investment and accompanying implications for ethical deliberation in the Norwegian case is also replicated at the global level. For example, in 2013, the Conflict Risk Network (CRN) announced it would be acquired by the UK responsible investment service provider, the EIRIS Foundation (VigeoEiris 2013). Prior to the acquisition, the CRN was a project of the US-based charity United to End Genocide. It was comprised of institutional investors, financial service providers, and other stakeholders who called on corporate actors to support peace and stability in areas affected by genocide and mass atrocities, with a focus on Sudan and Myanmar. The acquisition was announced as a win-win for both organizations, where the CRN could enhance its analytic capacity and global reach through EIRIS and the latter could enhance its client base in the USA (VigeoEiris 2013).

In December 2015, EIRIS merged with French competitor Vigeo. Following the merger, the CRN manager role was fused with "business development" (Ethical Corporation 2016). The postholder was expected to take responsibility for new business development and account management for Vigeo Eiris and EIRIS CRN. The post was targeted toward an "experienced sales professional" with a proactive approach to sales and knowledge of the CRN's areas of focus (Ethical Corporation 2016). In a separate development, since the merger, Vigeo Eiris has also come under scrutiny by civil society groups such as Western Sahara Resource Watch who allege the firm has overlooked human rights due diligence by certifying "green bonds" for Moroccan energy projects in the occupied territory (Western Sahara Resource Watch 2017).<sup>9</sup> While these two incidents may seem unrelated, I suggest that Vigeo Eiris' commodification of a civil society forum

may have inadvertently constricted its internal structural capacity to diffuse conflicts with critics, prompting NGOs to instead use "name and shame" tactics from the outside.

In effect, the "mainstreaming" of the CRN turned what was primarily an ethically driven network that served as a voice for moral outrage at corporate complicity in gross human rights violations into a subscription-based service through which responsible investors purchase data about companies that operate in conflict zones.

Why are spaces for broader, socially engaged ethical deliberation by investors on HRICZs being eroded? I argue that the diffusion of sustainability considerations across the financial system resulted not from a triumph of ethical reasoning but rather of legal-instrumental logics buttressed by the dual concepts of fiduciary duty and materiality.<sup>10</sup> As a result, mainstream investors who now make up the majority of the "responsible investment community" have been focused in defining their expectations of companies and the optics of responsible investment, rather than on societal expectations of long-term investors. This matters because by emphasizing the former, the conversation has been constrained to specific mechanisms of corporate control – such as lowering information asymmetries by asking companies to disclose human rights policies or requiring firms reporting against recognized global standards. In this context, "firm

<sup>9</sup>To be clear, this is not a position on the veracity of the complaints. Vigeo Eiris disputes these allegations, stating that it does not believe that international law or other human rights due diligence require them to seek any particular consent to carry out its bond certification work in the region. The full correspondence regarding this issue is available via the Business and Human Rights Resource Centre.

<sup>10</sup>A significant amount of legal scholarship has been devoted to evaluating whether investors would be in breach of their fiduciary duties if they neglected to consider sustainability factors (see, e.g., Sullivan et al. 2015). The general consensus seems to be that investors would not be in breach of their fiduciary duties if they include within decision-making sustainability factors that are deemed to be material, i.e., expected to impact a company's business, operations, industry, or financial position, or its future financial performance.

performance” has been defined narrowly in terms of material financial impacts that can be traced neatly to a particular value driver, rather than on the broader social impacts of these firms.

Despite the emphasis on materiality, critics argue that social measurement metrics to date have been largely inadequate for investors. Research by the NYU Stern Center for Business and Human Rights pointed out that investors have been too willing to accept data that does little to actually assess the social performance of the companies in which they invest. The “social” dimensions of responsible investing tend to be viewed as a check-the-box exercise in which investors and companies can appear to comply with rising consumer expectations around sustainability while avoiding the actual costs of improving performance (O’Connor and Labowitz 2017). This conclusion echoes findings from an Institute for Human Rights and Business and UNEP Inquiry report that noted one of the key challenges in moving from modern finance to sustainable finance is the methodological disconnect between the capabilities of mathematical finance and ethics, as the direct social impacts of financial processes are not captured directly within the underlying quantitative models or technical rules (Wachenfeld et al. 2016).

Such lags in investment decision-making speak directly to Louche and Hebb’s (2014) observation that insufficient attention has been paid to the social impacts of responsible investment. However, by widening the lens on impact from firms to society, responsible investors can take concrete steps toward striking a better balance between ethics, fiduciary duty, and materiality in the context of investment decision-making.

## The Future of Investor Advocacy on HRICZs

Looking ahead, responsible investors will need to measure companies’ real-world effects, not just their efforts, when seeking to intervene in complex areas such as HRICZs (O’Connor and Labowitz 2017). Moving toward this goal can involve promising avenues for expanding or indeed recovering ethical reflection in investment

decision-making. Such efforts will require, at minimum, investment staff with specialized skill sets on social metrics and better engagement with affected communities and civil society stakeholders who are best placed to speak about the real-world social impacts of companies.

However, to date, very few large investors have well-institutionalized mechanisms for stakeholder engagement that can inform agenda setting and impact reviews for investor advocacy, despite the popularity of stakeholder-based financial theories in grounding responsible investment. Opening up the black box of investment decision-making to stakeholder input can enhance opportunities for ethical deliberation in conjunction with financial considerations.<sup>11</sup> This approach also offers a valuable corrective to instances where inaction is justified on the basis that material human rights issues for institutional investors at any given time are too numerous to address systematically. The UNGP Reporting Framework exhorts firms to engage with stakeholders as means to identify, manage, and report on human rights risks that are most salient and severe for its operations. There is no credible reason why this guidance cannot be extended to investors.

To conclude, whether institutional investors will rise to the ethical challenge of championing human rights for people affected by conflict depends, in part, on how their internal governance and risk management systems will evolve to accommodate ethics. Some scholars suggest that as the responsible investment field continues to mature, we can expect to see more attention to procedural ethics, engendering a shift in focus from *what* issues get decided on to *how* issues are decided upon and by whom (Vandekerckhove et al. 2012). A deeper foray into procedural ethics will necessitate that investors articulate their commitment to fundamental ethical principles such as freedom, social justice,

<sup>11</sup> This is not to suggest that beneficiaries or affected stakeholders should be involved with the minutia of asset selection and management but rather that innovative governance models focused on gleaning social impact (such as citizen’s assemblies or targeted stakeholder meetings) could complement existing efforts to steward institutional assets with a high degree of financial prudence.

equity and fairness, and, perhaps more interestingly, what kinds of decision-making processes will be needed to address instances when these principles may conflict with each other or with other investment beliefs around how markets function.

## Introduction

F.A. Hayek was an economist from the Austrian School. His early work described the inherent contradictions of socialism. Though a stern critic of corporate social responsibility, he was an advocate for ethical business behavior because it was more efficient to facilitate trade, and trade itself, he argued, could lead to peace.

## The Work of Friedrich Hayek

Friedrich Hayek was a Nobel Prize winning economist whose main scholarly activity occurred during the mid to late twentieth century. His main work in economic theory argued that socialism was incoherent. It threatened to lead to “serfdom” as the government controlled the decisions ostensibly made for the benefit of all societies but to the detriment, in his theory, of the individual (Hayek 1944). Rather than reposing confidence in government decision-making, he championed the idea of spontaneous orders, by which emerging orders would arise from a given situation to address social and economic issues provided that individuals had sufficient freedom to act. In other words, free markets would typically solve issues in a way more efficient and more effective than through government.

This theme permeated his work, including his 1988 work, *The Fatal Conceit* (Hayek 1988). In that work, he further argued that the complexity of the issues confronting any significantly sized contemporary societies would be too numerous for any one order to solve. To think that a centralized government would be able to do so was a “fatal conceit.” Instead, society was in a better position if individuals were free to respond to situations and, in so doing, would create orders that would more directly resolve issues.

Hayek’s theory had little use for what might be called corporate social responsibility. Like most free market economists, Hayek believed that corporations fulfill their role in society by efficiently converting resources into products and services useful to society without taking on “social” issues. Indeed, he went so far as to argue that should corporations undertake such social activities, the

sector responsible for administering social goods – the government – may resent such an intrusion and move to socialize the business itself. Businesses, he argued, should focus on its own affairs and leave social issues to other sectors of society. Thus, CSR is not favored in Hayek's writing.

At the same time, however, ethics are favored. Hayek believes that basic ethical virtues such as honesty, truth-telling, promise-keeping, and production of high-quality goods and services create trust. Trusting relationships allow parties to be willing to trade and, indeed, to trade more efficiently if one can depend on another party to practice such virtues rather than expending resources to police such conduct. Virtues thus help market efficiency.

By enhancing relationships, virtues also can increase the scope of trade. Projecting a virtuous cycle, enhanced relationships, based on virtues, increase trade, which encourages more relationships, which has the potential to create greater peace. Indeed, Hayek sees this relationship between trade and ethics as central to the possibility of creating global peace.

The question is, given the importance of virtues such as honesty, truth-telling, promise-keeping, and production of high-quality goods and services, where these virtues come from. Hayek's argument is not especially inspiring, but it is revealing. Hayek argues that a business person could determine, through a game-theory-like set of repeating interactions, that practicing ethical behavior is smart business.

Yet, this is an inefficient process. What is more efficient is for individuals to believe that virtues are good in their own right and then to put them into practice in business. Accordingly, Hayek sees a strong role for societal institutions that teach moral virtue, such as religious organizations, educational institutions, and other actors in civil society. Hayek is agnostic as to whether these virtues do possess an independent good, but he does believe that the confidence in their independent good does provide for an efficient mechanism for their adoption, which, in turn, benefits trade, relationships, and peace.

Philosophical systems of ethics

## Introduction

The development of western philosophical thought in practical and professional ethics has been dominated by three major theorists and the systems they developed: Aristotle, Immanuel Kant, and John Stuart Mill. Each one of these individuals was responding to the discussions about ethics that occurred during the time in

which they lived; however, two things set each of them apart from their contemporaries. First, in their writing, they each articulated fundamental aspects of ethical decision-making that profoundly advanced our understanding of ethics. Second, the insights gained from each of these individuals stimulated new discussions during their own time, and they continue to enlighten and advance our understanding today. The sections that follow provide an overview of the key concepts and models for ethical decision-making that illustrate what we value and how we make decisions in business and the professions.

### Aristotle and Virtue Ethics

In building an ethical system, Aristotle (384–322 BC) takes as his starting point a search for the good. He states in the opening words of the *Nicomachean Ethics*, “Every art and every inquiry, and similarly every action and pursuit, is thought to aim at some good” (1094a). Trained as a biologist, he looks at human behavior like a scientist – using observation to build a moral system grounded in what he argues are fundamental aspects of human nature. His approach to finding the good toward which we all aim is to examine human activities – the things we do.

“For just as a flute-player, a sculpture, or any artist, and in general, for all things that have a function or activity, the good and the ‘well’ is thought to reside in the function, so would it seem to be for man” (1097b25). To be a good flute player, a person must develop the skills or functional capacities associated with that activity. Similarly, to be a good person, one must develop the skills or functional capacities that will bring about moral excellence.

Unlike playing the flute, however, human activities have multiple objectives or instrumental ends, and what Aristotle is looking for is the ultimate good toward which we all aim. This ultimate end must be based on the unique functions that define what it means to be human, and Aristotle argues that the defining feature is our capacity for practical reason. Ethical decision-making, when guided by moral virtue, enables

us to fulfill our nature and achieve well-being or happiness (eudaimonia) – the end toward which all human activities ultimately aim. Virtue and practical wisdom do not arise in nature but are acquired. What distinguishes the virtuous person is the capacity to recognize and reject extreme options influenced by an instrumental or misunderstood end. For Aristotle it is not enough to intellectually know what is good; rather it is doing and living a good life through action. We achieve well-being through doing virtuous actions, and this is what constitutes moral excellence in human behavior.

A fundamental ingredient in achieving excellence is developing a moral disposition. Like a star athlete who builds muscle memory through practice, excellence in moral behavior can only be achieved by building moral “muscle memory” through practice. The moral virtues that we recognize and praise – compassion, courage, generosity, honesty, and temperance – are the building blocks to a disposition that we commonly identify as one’s moral character. Moral wrongdoing, by contrast, results from acting in a manner that contradicts the moral virtues (e.g., acting in a cowardly or dishonest manner) or from faulty practical reasoning (e.g., seeking the wrong end, an end that will not bring about well-being).

Finally, embodying good moral character means using our practical reason not just on one or a few occasions but over a lifetime. A truly virtuous life requires consistent and coherent practice that results in a natural harmony (eudemonia) between our actions and the end – the ultimate good toward which we all aim.

### Kant and Respect for Persons

Immanuel Kant (1724–1804) begins his moral system posing much the same question as Aristotle – defining what we mean by the word *good*. “Nothing in the world – indeed nothing even beyond the world – can possibly be conceived which could be called good without qualification except a good *will*” [*FMM*, 393]. Kant proceeds in this endeavor in a far different manner, and his

moral system is different from Aristotle's in both the structure and the content.

Kant, in arguing that a *good will* is the only thing that we can conceive as good without qualification, sets his theory of ethics apart from others in three critically important ways: First, methodologically, what we understand about the *good will* is not based on empirical observations but rather on rational argument. Second, the *good will* is not a teleological good where the moral rightness of our actions is based on achieving a specific or general end. And, third, the *good will* is a free will, and it is our rational capacity that gives us the ability to construct and impose moral obligations on ourselves.

What Kant refers to as moral law constitutes the foundational basis of the rights and duties that govern our moral relationships with one another and the world. These foundational laws cannot be derived from the empirical observations of the various and particular things people do, nor can they be based on a generalization that all human functions aim at some end. For Kant, ethical decision-making is an exercise of human reason. He argues that moral law, like the physical laws of the universe, must apply to all rational beings, and he identifies three fundamental principles that constitute moral law. Kant labels these principles as Categorical Imperatives or CI. The principles are categorical in form (they command without exceptions) and in content (they provide the basis from which our specific duties to others are derived).

1. "Act only according to that maxim through which you can at the same time will that it should become a universal law'." Commentators refer to the first Categorical Imperative as the universalizability principle. (CI #1; Kant, GMM 421).
2. "Act in such a way that you always treat humanity whether in your own person or in the person of any other, never simply as a means, but always at the same time as an end." The second Categorical Imperative as the humanity principle. (CI #2; Kant, GMM 429).
3. "Act according to the maxims of a universally legislative member of a merely potential realm

of ends." The third Categorical Imperative as the autonomy principle. (CI #3; Kant, GMM, 439).

The universalizability principle stipulates that moral rules (maxims) must apply to all rational beings without regard to time or place. This principle, a formal condition, asks us to consider if the decision I am about to make is a decision I would want all people to make in a similar situation.

The humanity principle asserts that our ethical decision-making has a moral impact on others as well as the decision-maker. This principle directs us to treat others as having inherent worth and dignity, and not merely as an instrument or means to our benefit. For Kant the humanity principle provides a bridge from the formal structure of the first CI to the moral content inherent in the decisions we make. Although we can treat others as objects or means to our particular end, the ethical imperative is to treat others as rational beings who deserve to be treated as moral agents.

The autonomy principle acknowledges our standing as moral agents who, because of our free will, have the capacity to create and apply maxims (principles and rules) that govern an ethical world with equally rational beings.

Taken together, these three moral laws constitute the foundation for Kant's ethical system. They apply to all rational moral agents; they dictate that we are morally obligated to treat one another with dignity and respect; and, Kant argues, it is our moral autonomy, our rational free will that binds us together as moral agents.

A fundamental key for understanding Kant's ethics is human freedom. Moral agents are autonomous beings who have both the freedom to make moral law and the freedom to impose that law upon themselves. Freedom for Kant goes beyond the common notion of freedom as the absence of law or constraint (negative freedom) to a positive concept of freedom as the rational capacity to enact moral obligations upon ourselves. As physical beings, we cannot choose to accept or reject the physical laws of nature. However, as moral beings, it is our free will that enables us to both construct moral laws and to make moral choices. It is our autonomy as moral agents that gives us moral rights and enables us to bind ourselves to

the moral duties we bear toward others. To understand the moral relationships we have with others, Kant's system counsels us to ask the deontological question: What obligations and responsibilities do I have in this relationship?

## Mill and Utilitarianism

John Stuart Mill (1806–1873) opens his most influential work in moral philosophy, *Utilitarianism*, with the observation that “From the dawn of philosophy, the question concerning the *summum bonum* [highest good], or, what is the same thing, concerning the foundation of morality, has been accounted the main problem in speculative thought. . .” (chapter 1). Like Aristotle and unlike Kant, Mill takes a naturalistic approach to moral theory building. Relying on science and the observation of human actions, he argues “that the foundation of morals ‘utility’ or the ‘greatest happiness principle’ holds that actions are right in proportion as they tend to promote happiness; wrong as they tend to produce the reverse of happiness. By happiness is intended pleasure and the absence of pain; by unhappiness, pain and the privation of pleasure” (chapter 2). Mill was certainly not the first philosopher to propose utility as the basis for a moral system, but his concise and clear statement of its principles have guided much of the discussion ever since.

Mill is a consequentialist, and the utilitarian doctrine states that happiness is both desirable and the ultimate goal of moral action. All other things are only desirable as a means to that end (chapter 4). The moral worth of our actions should be judged in terms of the consequences we aim to achieve, although Mill recognizes that our actions may have multiple ends or may be done for multiple reasons. Thus, we may hold virtuous action in high regard; however, virtues are valued as a means to happiness and do not have intrinsic value in themselves.

Mill refines the utilitarian principle in two very significant ways. First, he argues that in calculating the amount of happiness that an act may produce, we can distinguish between the amount of pleasure and the quality of that pleasure. For instance, an act that produces more physical

pleasure may not on quantity alone supersede intellectual or esthetic pleasure. Both quantity and quality matter when measuring the happiness an action may produce.

Second, in an attempt to refute charges of egoism, Mill argues that “the happiness which forms the utilitarian standard of what is right in conduct is not the agent's own happiness but that of all concerned” (chapter 2). And, as a forerunner to contemporary environmental advocates, Mill goes even further in suggesting that “the end of human action. . .the standard of morality. . .[is] to the greatest extent possible, secured to all mankind; and not to them only, but, so far as the nature of things admits, to the whole sentient creation” (chapter 2).

The development of utilitarian models for ethical decision-making identifies two forms: act utilitarianism and rule utilitarianism. Act utilitarianism would judge the moral worth of a decision based on a calculation of the benefits and disbenefits of the case at hand. For example, I could decide to tell the truth in this instance because my calculation has demonstrated that doing so will increase overall happiness. By comparison, rule utilitarianism would judge the moral worth of a decision based on the expected benefits from following a well-established moral rule. For the rule utilitarian, past experience can demonstrate the practical wisdom of rule following and not require the calculation of benefits or disbenefits in each specific case. Although most commentators consider Mill to give prominence to act utilitarianism, one may find examples in his writings of both act and rule utilitarianism.

## Conclusion

All individuals in business and the professions make ethical decisions and evaluate the ethical decisions of others. This is true in business whether you are a new, part-time employee or a seasoned, chief executive officer and true in the professions whether you are a nurse or the chief of surgery. We make moral decisions at the workplace whether it is on the factory floor, in an emergency room, or when working on a laptop computer while doing business in a foreign

country. Our decisions reflect what we care about and the process we used to justify those decisions.

Philosophers are model builders, and the works of Aristotle, Kant, and Mill are examples of historically significant advances in the development of ethical systems. Each system produces a model for ethical decision-making that illuminates the values we care about and the structure we used in analyzing our ethical decisions and the decisions of others. This concluding section provides a brief look at how these ethical systems can serve as a basis for understanding ethical decisions in business and the professions. Clarifying the process will enable us to make better ethical decisions and to recognize how different values and different forms of moral reasoning often lead to confusion, disagreement, and conflict in the workplace.

Aristotle's system of virtue ethics examines human actions and identifies the qualities those actions reflect. We praise virtues such as compassion, courage, fairness, generosity, and honesty because they represent decisions based on sound practical reason. We respect those individuals who exhibit these qualities because their decisions are focused on well-being for themselves and others and reflect a person whose high moral character we can trust.

This model for decision-making counsels us that when faced with a moral choice, the question we should ask is: What quality of moral character will my choice in this case represent? Will I be acting courageously or cowardly? Will my decision represent fair and equitable dealings with others or prejudice and deceit? We hold in high regard those individuals who consistently reveal these qualities in their ethical decision-making and consider them to be exemplars of moral character whatever position they may hold in business or a profession.

Kant's ethical system is grounded on a conception of what it means to be a human being in relationship with others. First, as a human beings, we possess a rational free will that is capable of establishing moral laws – laws that delineate rights and duties – that we impose on ourselves. Second, since all rational human beings have this capacity, it means the laws we establish must apply to all of us. Kant is identified as a deontologist because his model for ethical decision-

making holds that the moral rightness of an act depends on doing one's duty in accordance with the moral laws we have imposed on ourselves.

This model for decision-making counsels us that when faced with a moral choice, the first question we should ask is: Is the moral principle I am using to justify this choice a principle that others ought to follow if they were in a similar position? And the second question to ask is: Will my action treat others in a manner that respects their moral dignity? For Kant, it is our self-governing reason that establishes the equal worth of all people and requires us to respect that humanity in others. In business and the professions, this is a model that focuses on the rights and duties each party has one to the other.

Mill's moral system focuses on the consequences of our actions and the ends to be achieved. Human actions based on this model are about improving outcomes. Morally praiseworthy actions are those that increase happiness (pleasure), and immoral actions are those that result in unhappiness (displeasure). Mill and other utilitarian theorists consider individual happiness to be a benefit to the individual and a collective benefit to all. As such, the utilitarian model is one where the morally correct choice is one that will result in the most benefit for the most people.

This model for decision-making counsels us that when faced with a moral choice, the questions we should ask are: Which of the options will result in the most benefit? Or which of the options will result in the least disbenefit. In business and the professions, this is a model that judges our moral actions based on how well we improve the outcome.

These three models illustrate fundamentally different features of Western ethical thought that today guide decision-making in business and the professions. When our values align with colleagues, clients, business partners, or the profession, we have a basis for reaching agreement. That agreement may be accomplished because one or more of the models guide both parties in making the same decision. When our values are different, however, we may have conflicts and may not be able to reach agreement.

Recognizing these differences can be the first step in resolving disputes. Models for ethical decision-making can help us identify two important aspects in the decisions we make and in our evaluation of the decisions others in our business or profession are making.

First: What do we value most in ethical decision-making? Is it the moral character of the individual decision-maker or the organization? Or is it the rights or duties that I or my organization has in this relationship? Or is it the benefits that I, my organization, and stakeholders may achieve in this transaction?

Second: As an ethical decision-maker, did I accurately follow or apply the model in the decision? Errors in judgment may occur because I or my organization did not have the moral right being asserted or because I or my organization did not calculate the benefits and disbenefits correctly.

These models help us understand the processes we use in making ethical decisions, and in so doing gives us an opportunity to improve the contributions each of us makes in business, the professions, and throughout society.

## Human Dignity and Business Ethics

Howard Harris

School of Management, University of South Australia, Adelaide, SA, Australia

## Synonyms

Professional ethics; Propriety; Self-respect

## Introduction

Dignity is both a principle of law and a moral idea, “a principle of the highest importance” (Waldron 2012). There are connections between dignity and human rights, namely rights derive from the inherent dignity of the human person. This discussion is addressed under the entry on “Human Rights.” Dignity has multiple meanings. Those explored here are dignity as respect for status or position, sometimes called “aristocratic dignity”; the “inherent dignity” intrinsic to the human person, often associated with the philosophy of Immanuel Kant; and “comportment dignity,” the dignified behaviour or visible quality of acting with well-meaning demeanour, often seen on ceremonial occasions, great and small. All of these meanings are relevant to business ethics.

## Uses of the Term “Dignity”

There are paradoxes or downright contradictions in the ways in which the word “dignity” is used. For instance, a call to respect human dignity is often made in debates about end-of-life or right-to-life decisions by those advocating directly opposing views (Sulmasy 2013). In another instance, governments, NGOs, development

advocates and academics often talk of restoring dignity even though it would seem paradoxical that something that is inherent can be in need of restoration. The dignity of the aristocrat seems at odds with a dignity due to all humans. Application of the three-fold classification of aristocratic, inherent, and comportment dignity can help to lessen misunderstandings and dissonance arising from the confusion of meanings in common use, showing that the meanings are not arbitrary but related in ways that are useful for ethical analysis, and showing how the idea that one can rediscover inherent dignity can be seen as reasonable. The three-fold classification proposed here is sufficient for this task; classifications including more than three distinct uses of the word can be found in the works of Doris Schroeder (2010) and Michael Rosen (2012).

### **Aristocratic Dignity, Now a Dignity for the Common Person**

“Dignity” first appears as a concept related to elevated social status and to the occupancy of positions of high rank. This meaning of dignity can be found at least as early as Cicero in the first century BCE and continues uninterrupted through history.

By generalizing this status dignity across all human beings, the high status once restricted to nobility can extend to a universal dignity without distinction and without discrimination, delivering “nobility for the common man.” This argument is the basis of Jeremy Waldron’s *Tanner Lectures Dignity, Rank and Rights* (2012). The notion of “an ‘expanding circle’ narrative” has been used to describe this sea change in the way the word “dignity” is used, so that

the quality of dignity, once the property of a social elite, has, like the idea of rights, been extended outward and downward until it has come to apply to all human beings (Rosen 2012).

Thus, an equal dignity, the dignity of each and every person can be founded in a concept which has its beginning in the dignity attributed to kings, queens, judges, nobles and others of rank. Although the conclusion might seem the same as

that arrived at by those who hold dignity as inherent and universal, arising from human nature, God or reason, Waldron uses the law to show how the very dignity which we associate with rank is the ground of a “powerful dignity of us all” (Waldron 2012). The law, Waldron argues, acknowledges, upholds and protects this universal dignity in many ways, sometimes, as in the case of imprisonment for debt, in the contemporary West, providing protection to all that was once available only to nobility (2012).

Waldron does not suggest that there are no status differences among human beings. His conclusion is that all human beings have an equal and high status, which entails that they be treated with dignity.

### **Inherent Dignity: Kant and Human Rights**

The contemporary use of dignity in relation to human rights has its foundation in the work of the eighteenth century German philosopher Immanuel Kant. There are some things, Kant argues, that have value above all price; such a thing “has an intrinsic value – that is, dignity” for it is of “unconditioned and incomparable worth” (Kant 1785: §436). According to Kant’s analysis, only human beings possess this kind of dignity. It is a dignity that all (rational) humans have in common, that we all have equally and intrinsically, it is “our inalienable inner value” (Rosen 2012). The influence of Kant’s work has been so great that it is now natural for people “to assume that all dignity in the full sense of the word has to be *human* dignity” (Rosen 2012).

If dignity is inherent and inviolable, then talk of restoring dignity, fostering dignity or repairing broken dignity makes little sense – unless it is accepted that an inherent quality might not be recognized or understood by the person who has it. Inherent dignity is a human quality and recognizing it in oneself is an individual human act. Without diminishing the value of inherent dignity, it would seem to be of further value to a person to be able to recognize and use it to enhance her life or his life. This seems to be captured by the concept of the blossoming of felt dignity: a

recognition of one's own self-worth is needed before the self-dignity, attributed dignity or felt dignity can be acknowledged. Thus, inherent dignity can blossom or flower within individuals. It is an "inflorescent dignity" (Sulmasy 2013), an "unfolding of powers that human beings bring into the world" (Nussbaum 2011). This places human dignity in a social context which allows for progress toward universal and equal dignity.

### Comportment Dignity: Dignity of Action

Another use of dignity relates to dignified action. This usage is found in ancient times and persists to the current day. In ancient Rome, Cicero recognized the dignity of weighty and majestic speech, and the term sometimes extended to the orator or actor delivering the dignified speech. It re-appears in eighteenth century Europe as "tranquillity in suffering," a "beauty of character" to be strived for, as expressed by Schiller in his 1793 essay, *On Grace and Dignity*. In contemporary Western societies, status and rank exist in law and popular practice, and concepts such as noble bearing, "walking upright," or "befitting elevation of aspect. . . stateliness, gravity" are attached to that high status (*Oxford English Dictionary (2nd ed)*; s.v. "dignity 4"). If today someone was said to have dignity, this might bring to mind a picture of a person with "self-possession and self-control; self-presentation as someone to be reckoned with; not being abject, pitiable, distressed or overly submissive in circumstances of adversity" (Waldron 2012). Such dignity is expected of the judge and governor, and would be surprising in those of lower legal status such as the bankrupt and the felon.

By recognizing the distinct uses of dignity – as aristocratic, inherent, and comportment dignity – the potential confusion and dissonance in use can be put aside. Dignity can be at once universal and efflorescent. Individuals and societies can strive to make the beauty of character and dignity inherent in every human being more apparent and accessible (Pless et al. 2017). Although there are contrary views – such as the suggestion that talk of dignity

is "mere humbug – a pompous façade. . . without any genuine substance behind it" (Rosen 2012) – the concept of dignity remains strongly linked to human rights, and its relevance to any kind of human action is both extensive and enduring.

## Relevance to Business Ethics

Human dignity is relevant across a range of topics in business ethics, whether theoretical, practical or pedagogical. Six topics, each of them frequently encountered in the practice and teaching of ethics in business, will serve to demonstrate this relevance: stakeholder theory, corporate social responsibility (CSR), human rights, development ethics, employment and work, and pluralism.

### Dignity and Stakeholder Theory

The stakeholder theory of the firm replaces an exclusive primacy of shareholder interests with a regime in which all who can affect or are affected by the success and survival of the enterprise are to be taken into account in corporate decision making. The theory can take both descriptive and normative forms. In the descriptive sense, any decision making will be incomplete if the impact of those who can affect the outcome are not included in the evaluation, while the normative sense imputes a moral or fiduciary duty to take stakeholders into account. At the very least, where stakeholders are individual humans, for example customers, employees or members of the local community, it would be an affront to human dignity not to take them into account in decisions in which they have a stake. Thus, dignity provides support for the normative form of stakeholder theory.

### Corporate Social Responsibility

Corporate social responsibility is an omnibus term for a range of corporate actions which might benefit society yet cannot be justified on narrow economic grounds. Companies can have many reasons for acting in a way that acknowledges a corporate responsibility to society. Recognition

of the human dignity of the members of the society in which the business is operating can provide a strong, public justification for CSR activities. Some CSR activities, such as appropriate governance structures, may be required by law. Other terms used for the practice include corporate responsibility (Cowton 2011), corporate citizenship (Waddock 2002) and corporate sustainability (van Marrewijk 2003).

### Human Rights, Business Ethics, and Dignity

Among the more common approaches to ethical decision making are those based on Immanuel Kant's categorical imperative or some other form of deontological approach, and those based on human rights. One formulation of the Kantian approach is that human beings should never be treated as a means alone; put another way, humans are an end in themselves. This is because the human being has an intrinsic dignity that deserves respect at all times, a value beyond price. Dignity is something worth having, not to be taken away. Thus, any action which impugns that human dignity is unethical.

Whilst the Kantian approach to ethics is grounded in the capacity for human reason, the human rights approach is based on the idea that there are natural or inherent rights attached to human existence, and that those rights ought to be respected. The human rights approach is a relatively recent concept, and consideration of dignity has a significant role in its rise. The three uses of dignity – as status, as inherent, and as dignity of action – persisted through the nineteenth century. In the West, a fusion of humanist, liberal, Christian, socialist and Kantian ideas emerged, so that by the end of World War Two they had coalesced into a concept of universal human dignity which underpinned the Universal Declaration of Human Rights in 1948, the post-World-War-Two constitutions in many countries, and various declarations of human rights. Action in accord with these “charters” of dignity or human rights is often taken to be a measure of ethical behaviour.

Human dignity is also an aspect of the ethics of care, feminist ethics and other approaches which

have elements of the pursuit of (human) excellence, although the links are not as direct as between human dignity and human rights. Many approaches to ethical decision making find a place in the toolkit of the business person. Business ethics teaching, analysis and practice often makes reference to Kantian or deontological approaches and to the ethics of care or feminist ethics. Dignity is an important aspect of these approaches and can be a guiding principle for business ethics.

### Development Ethics and Dignity

Much of the economic and human development activity around the world is undertaken by large organizations, be they governments, not-for-profit enterprises, or corporations. Development activities, by definition, are going to affect the lives of human beings, hence the ethics involved is intensely practical. A specific development ethics has grown to support development practitioners and communities of need. It attempts to orient its reflection toward action that helps people to develop as human beings – that is, toward the growth and flowering of human dignity. In the development field, ethics will (or should) be a significant element in the great majority of decisions while in the wider corporate sphere the impact of ethics is often most keenly felt in areas such as conflict of interest and corruption (Goulet 1997). The choice of technology, the impact of tradition and culture, the ethics of aid giving and delivery, the impact of development actions on the environment can all affect the dignity of the individual members of the community in which development activities are undertaken.

### Dignity in Employment and Work

Marx (1867), Durkheim (1893) and Weber (1904) all saw denials of dignity in the relationship between labour and capital in modern industrial society (Giddens 1971). Reference to the dignity of labour appears in the late nineteenth century encyclical *Rerum Novarum* (Leo XIII 1891) and remains a feature of Catholic Social Teaching. Failure to respect the dignity of others is often mentioned as a symptom, or cause, of the disquiet

when concern is expressed about various aspects of work. There is also a strand of thinking that this dignity can be defended or restored through resistance to abuse, through action that increases the sense of pride in one's achievements, and in the creation of alternate meaning systems. Therefore, learning (in business school and elsewhere) what dignity is and how to foster it will be helpful in improving the ethics of business activity more generally.

Recent years have seen a rise in organizational interest in the well-being of employees. In some contexts, wellbeing and dignity have been conjoined, and one corporate response to concerns about dignity has been to introduce initiatives and programs to enhance personal well-being (Diener 2009). Although a link can be intuited between perceived dignity and well-being as contentment with one's life, or by making dignity a foundation for a fully realized life and equating that with well-being, concern for personal well-being is only in part about dignity. The relationship between the two concepts needs to be explored more deeply.

### Dignity and Value Pluralism in Business

Many businesses operate today in plural societies, where there are significant language, colour and tribal groupings and with multiple notions of good and no shared understanding of either business or ethics. It is the pluralism of values that is especially relevant in business ethics. In such situations, dignity is relevant in two ways. First, reference to dignity will be found in many philosophical and religious traditions. Second, the notion of universal dignity (often linked with human rights) implies a respect for persons *per se*, regardless of their beliefs.

Both the Islamic and Confucian traditions have a place for dignity, as does the Western (Judeo-Christian) tradition on which the entry is principally based.

Although one strand in Confucianism seems to place little importance on (human) rights, another important Confucian idea is concerned with the development of complete human beings who are

worthy of respect (*junxi*, see *Analects of Confucius*, c600BCE: 4:4). Equality in Confucian thought rests in a belief that all people are by nature equally good, born with a capacity for respect and for human relations based on respect (see for instance *Mencius*, c300BCE: 2A6, 6A6). In the Qur'an (c610), the sacred text of Islam, some have found support for a dignity or honour equally assigned to all human beings as children of a common ancestor (see 17:70), while others see support for views that deny universal dignity.

Businesses operate in society, and one aspect of business ethics is the relationship between business and society. The universal dignity of all humans is an important consideration in any analysis of the society in which business operate (including human rights and the pluralism of values in many contemporary societies) and in the analysis of the relationship between business and society (for example, in stakeholder theory, corporate social responsibility, the nature of work, and development ethics).

### Conclusion

Whilst "dignity" is used with a number of meanings in common speech and writing, and these uses are often conflicting, confusion can be reduced using a classification based on three distinct uses. The universal nature of human dignity, identifiable in each of these three common usages, provides a ground on which to base business ethics in considerations about how business should act in relation to society and individuals. Status dignity, once applicable only to those of high rank or birth, is now seen as applicable to all human beings equally. Also, human beings have an inherent dignity. Kant saw this arising from the human capacity for reason, although other grounds, including nature and religion, are also argued. While inherent, this dignity may not be recognized in or by all people, and action can be taken by individuals and enterprises to encourage the flourishing of human dignity. The third common use relates to dignified action, behaving with

gravity and stateliness, something that all can practice.

Notions of human dignity can be grounded in law, human reason, examples of dignified behavior, or religious beliefs. This broad support further extends the usefulness of the concept in the promotion and teaching of business ethics.

## Human Resource Management

Dawn A. Shearrow

College of Business, University of Rhode Island, Kingston, RI, USA

## Synonyms

Decision-making; Ethical development; Ethics; Human resource management; Morality

## Introduction

Employees often assume that human resources (HR) is the gatekeeper of ethical behavior of the organization. An assumption rightly placed as this is where concerned individuals faced with ethical dilemmas retreat to seek counsel, guidance, and support. Human resources enforce this notion through the development of organizational policy including legal and regulatory standards to which the individuals and the organization must adhere

(Bodie 2013). The HR department carries a heavy burden of being viewed as the frontline enforcers of the law and organizational values (Manroop et al. 2014). While the intersection of ethics and human resource management (HRM) boundaries are in its infancy (Jack et al. 2012), organizations need to recognize the value HRM has to impact ethical behavior within the organization. Specifically, the development of employees and leaders that are continually faced with ethical dilemmas. To expand on this perspective, organizations can utilize HRM as an ethical cornerstone to breed strong moral individuals that can lead effectively by improving ethical decision-making.

The world bore witness to the decision-making of leaders throughout the Covid-19 pandemic providing great insight to the critical aspects of leadership. Human resource professionals (HRPs) played a critical role during the pandemic leading the charge with decision-making, training, and implementation. Decision-making was impacted by the changing nature of the “unknown” while trying to integrate changes that aligned with the organization’s strategic mission, vision, and core values. The increased stressors (e.g., significant changes) inflicted upon organizations across the globe resulted in an increase in observed misconduct (ECI 2020). Additionally, employees were more likely to feel pressure to bend the rules with weak leadership (49%) compared to strong leadership (13%). Additionally, employees that perceived their leaders to have weak commitment (48%) to organizational values and ethical leadership felt pressure to bend the rules. Top management felt the greatest pressure to bend the rules (ECI 2020). Although these statistics are outcomes observed from the Covid-19 pandemic impact, leadership lessons can be obtained to prevent similar ethical outcomes by focusing on the role HRM plays in developing leadership programs that assist in ethical decision-making.

To support this notion, human resource professionals (HRP’s) recently surveyed identified that the key to recovery (from Covid-19 pandemic) is investing in people. Forecasts in spending and investing for HRM identified talent acquisition/recruiting (63%), leadership development (61%), and compensation (60%) as the

primary focus. While health care (18%), HR/data analytics (30%), and employee wellness and well-being (33%) having the least amount of spending (SHRM 2021). Recognizing that organizations are willing to invest more in recruiting and leadership development signals the need for HRM to have purposeful approaches for leadership development. Hiring and developing leaders must focus on the individuals’ sense of integrity (morals and values) and responsibility to the organization (George 2012). This breeds opportunity for organizations to further exam the need to incorporate ethical components in employee development training.

### **Organizational Ethics and Individual Morality**

There are countless examples of unethical behavior of organizations. The Sarbanes Oxley Act was an attempt to subvert or at least diminish the likelihood of leadership getting close to the edge of indiscretion (Gunz and Thorne 2019). Organizations provide training to employees and academic lecture halls bring knowledge to students regarding the ethical fortitude of whistleblowers. Yet often, the adverse consequences of those individuals following their moral compass and choosing the side of truth discourage others to come forward. There appears to be a disconnect in loyalty to organizational values and individual decision-making. The Wells Fargo case identifies key areas that could have potentially altered the outcome of their indiscretions. Evidence revealed from the whistleblower that multiple attempts to report wrongdoing was reported to the HR department. The department (individual) chose to ignore the corruption (Restrepo 2019).

Scholars and practitioners are relentless in their efforts to uncover key behaviors that facilitate or cause individuals to knowingly make the wrong choice. This phenomenon was identified by early moral philosophers such as Socrates, Plato, and Aristotle referred to as “akrasia” (Kraut 2018). The discussion of morality was pushed further to better understand what happens to an individual’s moral judgement when faced with ethical issues.

So how can HRPs ignore ethical allegations when approached by their employees? The notion, “knowing what is right but failing to act on that knowledge,” suggests a disconnect that scholars have identified as the moral judgement-action gap (DeTienne et al. 2019 p. 433). This gap of morality appears to fall on the shoulders of the individual. Organizations can no longer ignore that individual morality plays a role in the decisions leaders (employees) make. When 30% of top managers feel pressure to bend the rules the adverse effects are sure to follow (EIC 2020).

### HRM and Ethical Decision-Making

Scholars and practitioners will continue to be plagued by ethical dilemmas. The argument of right and wrong will never be resolved. Greek philosophers even argued on the issue of right and wrong good versus bad. The examination of moral development as it relates to business ethics identifies moral psychology and moral philosophy collectively contributing to the nature of morality (DeTienne et al. 2019). To make a case that morality and ethical decision-making are connected warrants further investigation into the impact HRM can have on leadership effectiveness within the organization. An examination of ethical decision-making in business identified awareness, individual and organizational factors, intent, and moral intensity as contributing factors (Loe et al. 2000).

Scholars are beginning to uncover critical factors that contribute to unethical decision-making attributed to individual’s violating their own values. As a result of this discovery new insights into the concepts of “moral injury” and “moral recovery” are considered (Cullen 2022, p. 485). The wisdom of early philosophers (Kraut 2018) on moral judgement extends to modern times. Organizations will continue to be plagued with unethical behavior. Embracing the notion that moral recovery is a possible approach when indiscretion happens can assist the organization in their approach rather than allowing it to infect the organization further (Cullen 2022).

The ethical decision-making framework of Ferrell and Gresham (1985) identified three key variables that provide insight into ethical decision-making: the individuals cognitive structure, significant others in the organization, and opportunity for action. Although this framework is soundly based in the marketing literature, the factors influencing decision-making are relevant and can be applied to ethical dilemmas. Additionally, this framework supports the argument that the organization, specifically the HR department, can influence the decision-making of employees especially ethical decisions.

### Leadership Development and Making the Connection

Leadership development is no longer isolated to executives or supervisory roles. Organizations have acknowledged the value of investing in all employees. Now more than ever this must be embraced and supported through HRM and their strategic vision. Consider how the pandemic situated employees in ethical dilemmas despite the role they were hired for. When the external environment strikes there is less control to adapt and adjust, strategically leaving employees vulnerable. As previously mentioned, when organizations must make significant changes there is a chance that employee misconduct may increase (ECI 2020). Recognizing the need to identify and measure ethical health within the organization provides an opportunity to discover changes that need to be made. It opens the door for HR to lead efforts in transforming employee development to include strategies for ethical decision-making. The greater challenge is deciding to go through the open door of opportunity and act upon the knowledge.

Since HRPs have the responsibility, resources, and influence, implementing an ethical component into employee development to assist in ethical decision-making seems like the logical place to start. Research has shown that investing in training improves operational and financial performance of the organization. Additionally, when HR is actively involved in the process employee

**Human Resource Management, Table 1** Improving organization's ethics health. (Adapted from E&C 2020)

| Possible identifiers of issues impacting the ethical health of the organization                  | Indicators of ethically healthy organizations                                                  | Achieving ethics health in organizations                      |
|--------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------|---------------------------------------------------------------|
| Does the organization have a clear set of shared values to guide employee decisions and actions? | Few employees feel pressure to compromise organizational ethics standards                      | Commit to ethical leadership                                  |
| Are supervisors held accountable for their mistakes?                                             | Misconduct is rare                                                                             | Shared values and building an ethics-focused business culture |
| Do supervisors show genuine interest in their employees' ideas/opinions?                         | Observations of misconduct are reported, and reports of misconduct are appropriately addressed | Invest in building a strong ethics and compliance program     |
| Do they provide feedback to their employees to help improve their work?                          | Employees who report misconduct do not experience retaliations                                 |                                                               |

commitment and competence increased in turn having a greater impact on operational and financial performance (Choi and Yoon 2015).

Organizations spend a great deal of money acquiring talent that is aligned with organizational values and principles especially leadership positions. It is imperative that the strategies in place and core values are embraced by those hired. Can we assume after the selection process and socialization of new leaders (employees) they will continue to maintain strong decision-making skills in a new environment? In a new organization with new individuals to lead and new teams to guide? Ultimately the goal is to retain quality individuals. To do that, preventative measures must be considered that benefit voluntary or involuntary separation. Since organizations are willing to invest a larger portion into leadership (employee) development (SHRM 2021), it is an opportune time to insert an ethical component.

The Ethics and Compliance Initiative is one organization that provides resources along with scholarly research to assist organizations with their ethical endeavors. One initiative provides organizations with the necessary tools to begin evaluating the ethical health of the company (ECI 2020, p. 11). As seen in Table 1, organizations can begin asking questions that can assist in evaluating the necessary pieces to determine the current ethical state of the company. From there key qualities of an ethically healthy organization are identified along with practical tools of analyses are suggested.

## Conclusion

The cornerstone of the organization is the HR department. New employees look to HRPs for guidance and support. While tenured employees depend on HRM to provide the necessary resources for growth, stability, and well-being. The notion that indiscretions or unethical behavior will always be handled appropriately by HR and the organization can no longer be assumed. Ensuring that ethical and moral components are part of employee development is critical to the ethical health of the organization. Organizations need to approach ethical issues head on and be willing to ask the tough questions. Investing in employee surveys that focus on ethical issues is a great place to start.

Ethics cannot be left to chance. Developing an ethical component in employee development training provides a solid foundation for assessing and measuring individual behavior as well as organizational health. This should also include individual morality. The intent is not to change an individual's morals or value system, rather identify foundational moral principles that provide the opportunity for organizational buy-in toward company values.

Finally, make the decision to change. Whether you need to turn the ship around or adjust the sails slightly, approach ethics head on. The Ethics and Compliance Initiative is just one resource that can get things moving in the right direction. Their comprehensive toolkit can assist HRPs in getting

that door open. Organizations need to evaluate and act based on findings. Ethics cannot be left to chance.

## Human Rights

John Douglas Bishop  
Trent University, Peterborough, ON, Canada

## Synonyms

Civil rights; Dignity; Equal rights; Justice; Natural rights; Respect; Rights-based duties and obligations

## Definition

The theory of human rights is an ethical or moral theory; that is, human rights language evaluates actions as being ethically good or evil and socioeconomic-political institutions as being just and unjust. Human rights theory is a type of deontological theory because it concerns the ethical duties of humans. This is not immediately obvious because human rights theory emphasizes people's rights, but every rights claim is a claim about the duties that other people and entities owe the

rights-holder. Human rights theory is really a theory about the duties and obligations of others.

## Types of Rights and How Human Rights Relate to Other Types of Rights

Rights can be categorized depending on the grounds on which the right is claimed. Human rights claims are usually based either on ethical theory (e.g., Sumner 1987) or on recognized international declarations of rights, most notably the [United Nations Universal Declaration of Human Rights](#) (all article numbers in this essay refer to this Declaration).

Human rights, and the language of human rights, work differently from legal rights. An individual's legal rights are whatever the law says they are in the jurisdiction in question. Legal rights come in a hierarchy with the laws further up the hierarchy generally overriding those lower down. At the top of the hierarchy are constitutional rights, then, roughly, treaty rates, quasi-constitutional statute rights, other statute rights, common law rights, institutional rights, and contractual rights. There can be exceptions to this hierarchy in some jurisdictions.

Beyond these are rights claims that are simply asserted by the supposed rights-holder. The effectiveness of such assertions depends on whether other people or institutions recognize the corresponding duties as legitimate obligations.

Both the human and legal rights of individuals need to be distinguished from group rights and sovereignty rights, which belong to collections of individuals and to countries or nations, respectively. The right, e.g., of the people of Québec to preserve French as a living language in Québec is a group right very different from any individual's free speech right to speak French. The right of Québec to remain in or separate from Canada is the right of self-determination, which is a sovereignty right.

All rights claims, regardless of type, have a similar structure in that for every right someone, some group of people, or some entity such as a state or corporation has a corresponding duty. The exact nature of the duty is not always clear and is

often contentious, but loosely we often say that the duty is to "respect" the rights-claim and the rights-holder. Such duties can be moral, legal, institutional, or contractual depending on the grounds of the rights claim in question.

## Positive and Negative Rights and Duties

Human rights are sometimes divided into negative and positive rights. A negative right is a right for which the implied duty is to refrain from interfering with the rights-holder. For example, the right to security (#3) implies that all other people and entities must refrain from attacking or assaulting the rights-holder. A positive right is a right which implies a duty for others to perform specific actions, not just to refrain from interfering. For example, the right to food (#25) implies that the corresponding duty-holder has an obligation to make sure that the rights-holder has access to food. In many cases, it may not be clear who has the obligation to ensure food is available. The UN declaration mostly assumes that governments are responsible, but it can be argued that corporations, families, churches, and rich individuals also have positive human rights obligations.

The division of human rights into the positive and negative rights tends to be confusing because it is actually the duties that are positive and negative, not the right. Most, or maybe all, human rights have both positive and negative corresponding duties. For example, the right to security of person (#3) implies not only a duty not to interfere, it also implies a duty of the State to provide adequate and noncorrupt police, courts, laws, and other institutions.

Further, from the point of view of businesses, the distinction is generally a moot one. For example, the right to security of person for the people living downstream from a pulp mill implies that the mill owners have a duty to refrain from dumping mercury into the river. But observing that right would generally involve a positive obligation to spend money, perhaps millions of dollars, installing a wastewater treatment facility or other means of preventing pollution of the river.

## Equal Rights and Privilege Rights

Rights can be divided into equal rights and privilege rights. Human rights are all equal rights; that is, all humans have the same human rights and the human rights of every individual deserves equal respect. This is made clear in the United Nations Universal Declaration of Human Rights where the first sentence of Article 1 reads: “All human beings are born free and equal in dignity and rights” (see also preamble and #2).

Constitutional rights tend to be equal rights as well, at least as far as the citizens of the relevant country are concerned. On the other hand, contractual rights are generally privilege rights in that contracts confer special rights on specific people. For example, the lease on an apartment gives one individual or group the exclusive right to determine who lives in the apartment. With human rights, the question of who has and who does not have the right never arises – all humans have the same human rights. To exclude any individuals from respect for their human rights based on race, religion, sexual orientation, or, indeed, even on the basis of criminal record, is a violation of their rights. In the case of convicted criminals or even terrorists, imprisonment is not a violation of their human rights, but torture, lack of due process, and religious persecution are (#2, 5, 6–11).

## Human Rights Are Trump

Human rights are trump in that human rights take precedence over all other considerations no matter how important those other considerations are. Morally, there is no possibility of balancing human rights with other concerns. For example, if a business activity violates anyone’s human rights, then that activity is unethical no matter how much profit the business generates. This is clear in extreme cases; slavery is never ethical (#4) even if the institution creates immense economic benefit for the society overall. Business should never attempt a cost/benefit analysis if one of the costs is human rights violations.

Human rights are also trump over laws. There is both a language point and an ethical point in

this. The language point is that if a law contradicts human rights, then we say that those human rights have been violated. We do not say that those people do not have those human rights. This is different from legal rights; if the law does not grant a right to an individual, then we say that the individual does not have that right. We do not say that the law violates their legal rights, although a lower law may violate a constitutional right, in which case the lower law is invalid. Constitutional rights trump other laws. The ethical point is that it is always unjust or unethical to violate any individual’s human rights; there are no circumstances in which an individual does not have human rights.

## The United Nations Universal Declaration of Human Rights

The Preamble and Article 1 of the UN Universal Declaration of Human Rights make clear that the rights specified therein apply equally to all human beings, and explicitly state that they apply equally to men and women (preamble). It also says that the rights are inalienable (preamble). All member states “pledge” to “achieve, in cooperation with the United Nations, the promotion of universal respect for and observance of human rights and fundamental freedoms” (preamble). The key phrase is “respect for and observance of human rights and . . . freedoms.” But the Declaration admits that many of the rights are “aspirational” in that some states may not be able to implement some of them (such as a universal education system) immediately.

The Declaration gives several grounds for the importance of human rights. The recognition of rights is the “foundation of freedom, justice and peace in the world, . . .” and affirms the “dignity and worth of the human person.” This makes clear that rights-holders are individuals, though later the Declaration recognizes the importance of families (#16). Rights also “promote the development of friendly relations between nations,” “promote social progress and better standards of life,” and prevent the need for “rebellion against tyranny and oppression” (preamble).

Let us now summarize the rights specified in the Declaration.

1. All humans have a right to “freedom from fear” (preamble), and hence freedom from all threats to their “life, liberty and security of person” (#3). Everyone also has a right not to be enslaved (#4), and a right not to be tortured or subjected to punishment or treatment that is “cruel, inhuman or degrading” (#5).
2. All humans have a right to “freedom from want” (preamble). This includes a right to “social security” (#22) – not just Social Security in the American sense which applies only to seniors, but social security in a general sense for everyone. All humans also have the “right to work, to free choice of employment, to just and favourable conditions of work and to protection against unemployment” (#23). All humans have the right to “equal pay for equal work” (#23), the right to rest and leisure (#24) and “the right to a standard of living adequate for the health and well-being of himself and of his family, including food, clothing, housing and medical care and necessary social services, and the right to security in the event of unemployment, sickness, disability, widowhood, old age or other lack of livelihood in circumstances beyond his control” (#25). Motherhood and childhood are recognized as “entitled to special care and assistance” (#25).
3. All humans have the right to the rule of law; that is, to be recognized by the law as a person (#6), to have equal protection of the law (#7), to have remedy if his or her legal or constitutional rights are violated (#8), to have protection from “arbitrary arrest, detention [and] exile” (#9), to have a “fair and public hearing” (#10), to be presumed innocent until fairly found guilty (#11), and not to be subject to retroactive laws (#11).
4. All humans have the same rights and freedoms and should be treated equally “without distinction of any kind, such as race, colour, sex, language, religion, political or other opinion, national or social origin, property, birth or other status” (#2).
5. The Declaration makes clear that human rights are a matter not just of justice, but also of human dignity. “All human beings are born free and equal in dignity . . .” (#1). For example, Article 12 says: “No one shall be subjected to arbitrary interference with his privacy, family, home or correspondence, nor to attacks upon his honour and reputation.”
6. All human rights are protected regardless of the nation or territory “to which [they] belong,” and regardless of “national or social origin” (#2). All humans have the right to a nationality (#15), the “right to freedom of movement and residence within the borders of each State” (#13) and “the right to leave any country, including [their] own, and to return to [their] country” (#13).
7. Families are specifically protected. All humans have the right to be free from arbitrary interference in their families (#12), and families are “the natural and fundamental group unit of society and [are] entitled to protection by society and the State” (#16). All humans of full age have the right to marry, and the right not to marry – all “Marriage shall be entered in to only with the free and full consent of the intending spouses” (#16).
8. The declaration protects “the right to own property” (#17), but this requires a couple of comments. First, it is not clear that a person’s rights are violated if they own no property; rather, if they do own property they have a right to that property. Secondly, the declaration does not distinguish between personal property (such as clothes, houses, cars, etc.) and private property in the sense of the private ownership of the means of production such as land, natural resources, factories, mines, businesses, corporations, and so on. A State that does not permit the private ownership of some or even all of the means of production is not violating the human rights of their citizens providing it respects their personal property.
9. All humans have the right to freedom of thought and belief, freedom of conscience

and religion (#18), freedom of opinion and expression (#19), and freedom of peaceful assembly (#20). All humans have a right to an education (#26), “freely to participate in the cultural life of the community” (#27) and to benefit from their intellectual property (#27).

10. All humans have political rights, including the right to take part in government either directly or by voting “in periodic and genuine elections which shall be by universal and equal suffrage” (#21). All humans have the right to access public services (#21). The Declaration also says that “The will of the people shall be the basis of the authority of government; . . .” (#21).

## Duties and Obligations

All rights impose obligations on other people or entities; when a rights-holder has a right, someone else has a duty to respect that right. The UN declaration assumes that human rights impose specific obligations on States and all governments. In particular, the declaration says that “Member States have pledged themselves to achieve . . . the promotion of universal respect for and observance of human rights and fundamental freedoms . . .” (preamble). The duties of States are “respect for” and “observance of” human rights. But not only States are given duties based on human rights; the Declaration goes on to say the “every individual and every organ of society . . . shall strive by teaching and education to promote respect for these rights and freedoms and by progressive measures, national and international, to secure their universal and effective recognition and observance, . . .” (preamble). Specifically, the duties of “individuals” and “organs of society” are to “promote respect” and “to secure their . . . recognition and observance.”

It is not clear what an “organ of society” is. One presumes that at least religious organizations, schools, universities and such organizations are included since the duty is phrased in terms of “teaching and education”, but it probably applies to many other organizations as well.

From the perspective of business, the key question is whether corporations have duties with respect to human rights and what those duties are (Cragg 2012). In 2005, the United Nations Secretary General Kofi Annan appointed John Ruggie as special representative to clarify corporate obligations with respect to human rights. Ruggie proposed a “Protect, Respect and Remedy” framework, under which corporations have an responsibility to respect human rights, and to co-operate with the duties of States to protect human rights and with mechanism to remedy human rights violations (Ruggie 2008). For further information, see the entry in this encyclopedia on “Corporations and Human Rights”.

## Criticisms of Human Rights

Universal human rights have been subjected to social, moral, religious and political criticism. At the time the Declaration was passed and since then some States have objected to the individualism of human rights, arguing that the declaration ignores the rights of communities and States and the rights of other collectives. It has also been pointed out that some of the human rights of the Declaration violate some religious beliefs. For example, Article 18 guarantees the right to change religions, but some religions prohibit apostasy. The recurring theme of these sorts of criticisms is to object to the individualistic basis of human rights and to lament the failure of the Declaration to recognize the obligations that all people have to various collectives such as families, communities, religions, nations and, indeed, to humankind.

Objections, both moral and political, have also been raised to the universality of human rights. At the moral or ethical level, such objections are often based on claims that all moral beliefs are dependent on the culture in which they arise and that, therefore, there are no universal human values and no universal human rights. Such moral relativism, however, runs into two major problems. First, it may not be empirically true that there are no universal moral values; there seems to be considerable unanimity across many cultures, at least among the victims of human

rights violations, that such violations are unethical. Second, most people who argue for a morality based on moral relativism are in fact basing their argument on a belief in universal tolerance of cultural differences – which is itself a universal moral value.

The political objection to universal human rights is that they are, or can lead to, interference in the internal affairs of sovereign States. This view relies on the claim that human rights violations, possibly including oppression, murder, and torture, are morally only of concern to the State in which they take place. Most people, except perhaps oppressors, think that this is a very doubtful moral claim.

Other criticisms of the UN Universal Declaration of Human Rights are that some of the rights it specifies are vague, that it does not recognize all morally justified human rights, that the declaration has no force in that it is not law, that it does not hold anyone accountable for rights violations, and that efforts to help the poor and oppressed by championing their rights have simply failed. It should be added that some problems, such as the Israeli-Palestinian conflict, may not have any rights-based solution; in such cases, negotiated settlements may have to take priority over everyone asserting their rights. There is at least some truth in these criticisms, but they may not adequately acknowledge the good that human rights discourse has achieved; it is always hard to be sure about oppression that has not happened because concerns about human rights have prevented it.

## Summary

Human rights are claims that some persons or entities have an ethical or moral duty toward the rights-holder. Any such claim needs to be supported by ethical theory or by a publically accepted human rights code such as the UN Universal Declaration of Human Rights. Human rights take priority over constitutional, legal, treaty, and other rights, as well as over other social and economic concerns. The UN Declaration does not provide mechanisms for accountability or remedy for human rights violations, but it does

have important moral and diplomatic implications and its principles are often incorporated into national law of many States.

## Introduction

The phrase “human rights” commonly refers to the rights that all human beings have simply in virtue of being human (Griffin 2008). The idea is rooted in the notion of “natural rights,” which in turn is grounded in the belief that ethics is immanent and, at least to an extent, objective and universal in nature. This belief has been characteristic of several religious and spiritual traditions since ancient times (e.g., God-given rights in Abrahamic religions, laws of Nature in Stoicism). For the better part of the human history, however, natural rights were understood as being unequally distributed among people, as is exemplified by the plethora of kings throughout history who inherited the crown by reference to their divine right to rule. The Enlightenment period secularized the notion of natural rights and conceptualized the idea of human rights that every human being is entitled to regardless of race, sex, nationality, ethnicity, language, religion, and status. Following the end of the Second World War, the newly formed United Nations adopted the UN Declaration on Human Rights (UDHR), codifying a set of global human rights that would soon become a mainstream variant of ethics and obligations.

Within the discipline of business and management, the body of literature that adopts a human rights lens has in recent decades grown into a distinct field called business and human rights (BHR). It is a field that crosses, at least, law, global governance, and business ethics. In its legal form, BHR is concerned with access to legal remedy for victims of human rights abuses by business and is often critical of elements of domestic law, including aspects of “corporate personhood” and the legal construction of rights-relevant markets. As a global governance practice, BHR has generated numerous soft laws, codes of conduct, and polycentric regulations designed to regulate diverse businesses operating in diverse contexts.

As related to business ethics, and noting possible overlaps, two areas of BHR are most

relevant. First, the normative element of BHR, which asks questions of whether businesses can hold human rights responsibility, and how and to what extent these responsibilities should be perceived. Second, a more empirical element that studies how managers can implement human rights responsibilities, and how different implementation methods, such as codes of conduct, function in practice. This entry first introduces BHR generally and then looks at each of these business ethics-related areas in turn.

## Glancing at the History of BHR

BHR has proceeded through a series of institutionalizing innovations. The 1977 Sullivan Principles in apartheid South Africa – which encouraged businesses to pledge equal treatment of nonwhite employees – are often credited as the first BHR initiative, prior to the term BHR being used. The UN Code of Conduct for Transnational Corporations, which was first discussed from the late 1970s to 1992 but never ratified, was the first attempt to regulate businesses in international (soft) law. This emerged from the sovereignty concerns of the postcolonial states behind the New International Economic Order (NIEO), rather than human rights, and aimed at ensuring sovereign control of corporations and resources. A series of labor-related initiatives including the Fair Labor Association developed in the 1990s in response to sweatshop scandals in developing world factories manufacturing for global brands such as Nike. The Global Compact was the first formalization of a BHR agenda within an inter-governmental organization, and in 2011 the UN Guiding Principles on Business and Human Rights (UNGPs) were endorsed at the UN.

The publication of the UNGPs heralded a new era with BHR now having a firm doctrinal basis, rather than being constituted of myriad human rights-related concepts and tools. The UNGPs are organized around three pillars, the state duty to protect human rights, the corporate responsibility to respect human rights, and access to remedy in case of breach. This means that states are obligated – as both a matter of preexisting

international law and social obligation emanating from the new framing of the UNGPs – to protect rights-holder from harm by business. Businesses are expected – a “socially-binding” responsibility – to respect rights, meaning to do no harm to rights-holders. The UNGPs did not create new legal obligations but has led to significant new laws and policies, such as State National Action Plans to implement the UNGPs and domestic laws enforcing human rights due diligence (HRDD). HRDD is a means by which companies should proactively investigate the “human rights risks” within their own operations to avoid causing “adverse human rights impacts.” France has had a law based on HRDD – the “Duty of Vigilance Law” since 2017, and many states plus the European Union are developing similar laws, with Germany and Switzerland most advanced.

The UNGPs have been severely critiqued for their lack of ambition. These critiques include the “socially-binding” nature of the business responsibility, which makes respecting human rights optional for managers and assumes that social expectation, perhaps ethical obligation, will be enough to ensure good management practices. They also included that businesses did not have a responsibility to protect or fulfill rights, and various concerns over a lack of clarity. Most such concerns met the same response. The UNGPs were as ambitious as was feasible. The result of “principled pragmatism” represents only “the end of the beginning.” Moreover, the “strategic ambiguity” of the UNGPs makes them potentially more ambitious than they appear at first sight. Included in this is that “human rights impacts” cover a far wider range of harm to rights-holders than any legal definition of “human rights violation,” covering, for example, a business, reducing access to an essential service such as healthcare through price increases (Birchall 2019).

### Human Rights in Normative Business Ethics

Acknowledgment of the existence of human rights has immediate normative implications because rights come with correlative

responsibilities upon relevant duty bearers. Traditionally, this responsibility was assumed to fall sole on governments, and this remains generally true of legally binding international law. However, toward the end of the twentieth century, it became increasingly clear that multinational corporations can have significant influence over individuals, societies, and governments. This realization was coupled with a stream of revelations of serious human rights violations in large, renowned corporations, which has become a regular and expected part of the business section of the news. As a result, there has been increasing agreement that governments alone cannot guarantee that human rights are protected, and calls have been mounting for business organizations to recognize their own human rights responsibilities. This is where normative scholarship in business ethics steps in to clarify how the roles and responsibilities of businesses in relation to human rights must be defined.

To articulate the human rights responsibility of business organizations, the first step is to define what exactly human rights are. Even if it is agreed that there is such a category as human rights that represents the rights that every human being is entitled to, there is considerable diversity among scholars with respect to what those rights are. Two broad camps can be distinguished within business ethics: 1) The universalist camp argues that human rights must be defined and protected irrespective of cultural differences among societies (as attempted in, for example, the UDHR); 2) the relativist camp argues that different cultures define human rights differently based on their respective histories, values, and traditions (as attempted in, for example, the Cairo Declaration of Human Rights, which is based on Islamic teachings). The debates between these camps are part of the animated ongoing discussions in the literature of normative business ethics (Brenkert 2016).

Aside from this debate, the next step is to define what exactly is the responsibility of business organizations in relation to human rights. Core disagreements can occur around which

human rights businesses hold responsibilities, and the extent of responsibility toward these rights. These responsibilities are commonly partitioned according to a tripartite framework that includes a) respecting rights by not infringing upon individuals' rights; b) protecting individuals against infringements by third parties; and c) fulfilling access to rights. With respect to the right to health, for instance, most scholars agree that business organizations should respect the right through refraining from harming their workers, but most scholars agree that business organizations are not responsible for protecting the bodily integrity of their workers beyond what can be reasonably considered work related, and it is not agreed that businesses have any responsibilities to provide their workers with the education to enable them to improve their bodily integrity. Defining the exact scope of responsibility of business organizations with respect to human rights is at the core of current discussions in normative business ethics (Hsieh 2017).

Another important question for normative business ethics to address is why businesses should take a responsibility for human rights. What are the reasons, motivations, or justifications underlying the human rights responsibility of business organizations? Some scholars highlight a business case for respecting human rights, positing that enlightened self-interest is a sufficient rationale for the responsibility. Others argue that accountability is the key distinguishing feature between human rights and other moral norms and that, therefore, binding rules and institutionalized sanctions and remedies are necessary to enforce corporate responsibility toward human rights. And yet others argue that morality must be the core driver because human rights are basic moral rights grounded in human autonomy and agency. One critical implication of these discussions is determining if human rights responsibilities of business must be understood as voluntary or obligatory, and if some of those responsibilities are obligatory, at what level (international or national law) they must be enforced (Brenkert 2016).

Normative business ethics is a realm of articulation, analysis, and reasoning, and the ever-expansive discourse of human rights has exposed it to a new domain full of questions, puzzles, and indeterminacies. A lot of progress has been made, and scholars are approaching a phantom of consensus in some areas. Yet a lot remains to be debated.

### **Human Rights in Empirical Business Ethics**

The contemporary discourse of human rights has emerged out of international and national law. Consequently, research on human rights has to date been largely dominated by conceptual and normative scholarship with strong legal flavor. Within the much smaller literature of empirical business ethics on human rights, the majority of work have been case studies focused on documenting violations of human rights in bounded organizational settings with limited implications beyond the studied incidents. The dearth of empirical research on human rights in business is recently called out as one of the main problems that need to be addressed (Deva et al. 2019).

The significant contributions that empirical business ethics can make to BHR are visible in the parallels and connections of empirical work with the core concerns of normative business ethics literature on human rights. The debates between universalist and relativist camps can be informed by empirical studies of different societies to see if there really is some common denominator to culturally varied understandings of human rights. This enables researchers to discuss the already existing similarities and differences of the notion of human rights across societies and cultures rather than engaging in endless abstract arguments. Considering human rights as part of the broader morality in a society or culture, the literature of empirical business ethics has a lot to offer to the discussion of universality versus relativity of moral understandings (Melé and Sánchez-Runde 2013).

Similarly, the discussions on the breadth of the scope of human rights responsibility of businesses can be enriched by empirical investigations of

how this responsibility is perceived among business practitioners. There are studies that show the subset of human rights that most business practitioners consider relevant are labor rights and workplace health and safety (Ruggie 2007). There are also studies that highlight the stark difference between extractive and nonextractive sectors when it comes to interpreting and reacting to human rights abuses with business managers in the extractive sector showing a status quo bias justifying their support of repressive rulers (Vadlamannati et al. 2020). The guidance and recommendations of normative research for businesses cannot ignore these empirical findings that represent the reality on the ground.

With respect to the question of reasons, motivations, and justifications that drive businesses to take responsibility for human rights, empirical business ethics can shed light on the cultural repertoire that drives decision-making. So instead of unwarranted presuppositions about what are the motivations of business practitioners (e.g., the financial bottom line), empirical studies can identify the range of factors that are at play for any single decision by business practitioners (Shadnam *in press*).

In short, while empirical business ethics research has to date remained underutilized in BHR, it can make an indispensable contribution by clarifying how business practitioners in different cultural contexts understand human rights and business responsibility, and what makes them take or avoid responsibility. It elucidates the variation, dynamics, and politics of drawing the lines between moral, immoral, and nonmoral categories in matters related to human rights in business (Shadnam et al. 2021).

Business responsibility for environmental rights;  
Business sustainability and environmental justice;  
Corporate environmental responsibility

### Introduction

The environment has been the subject of corporate responsibility or responsible business conduct guidance tools since at least 1991 when the Organization for Economic Cooperation and Development (OECD) added an environmental chapter to the OECD Guidelines for Multinational Enterprises (OECD MNE Guidelines). However, the relationship between environmental change and human rights and the corresponding implications for responsible business conduct has been underexplored until recently. In 2011, a human rights chapter was added to the OECD MNE Guidelines, following the endorsement of the United Nations Guiding Principles for Business and Human Rights by the UN Human Rights Council. The substance of an environmental human rights approach to ethical business conduct has been gradually clarified since that time (Seck 2020b).

An environmental human rights approach to business responsibilities provides a crucial tool for ethical action in a time of global ecological crisis. The health of people and planet are inextricably intertwined, as is evident from the example of the Covid-19 pandemic. Climate change and loss of biodiversity are associated with a rise of zoonotic diseases like Covid-19, while those whose health has been compromised due to exposure to pollution are more vulnerable to diseases

like Covid-19. At the same time, it is impossible to comply with public health guidelines such as handwashing in the absence of access to clean water (Seck 2020b). In short, those whose environmental human rights have been violated are rendered vulnerable to other harms. Ethical business conduct necessitates attention to the impacts of environmental change on human rights, whether directly or indirectly caused by business conduct, and action to prevent and remedy associated harms.

### Understanding Environmental Human Rights

Sources of international and regional human rights and environmental law confirm that environmental human rights are comprised of both procedural rights and substantive rights, with equity and nondiscrimination as cross-cutting human rights concerns (Turner 2019; Atapattu and Schapper 2019). The 2018 Framework Principles on human rights and the environment clarify the content of an environmental human rights approach (Knox 2018). The starting point is recognition that the environment and human rights are interdependent: it is impossible to enjoy one's human rights to the fullest extent, including rights to health, food, water, and even the right to life, without a healthy environment; yet at the same time, the exercise of human rights to information, freedom of expression, participation, and remedy are essential in order to protect the environment (Knox 2018).

Procedural environmental human rights are well established in source of international environmental and human rights law. Key procedural environmental rights include the right to timely, affordable, and effective access to information on environmental matters that may undermine your rights, as well as the right to the prior assessment of environmental impacts of proposed projects or policies including their effects on human rights (Knox 2018). In order to fully enjoy procedural environmental rights, the exercise of rights to freedom of expression, freedom of association, and peaceful assembly must be respected with

regard to environmental matters. A key component of procedural environmental rights is the protection of a safe space for environmental human rights defenders that is free from harassment, threats, intimidation, and violence. Everyone also has the right to effective public participation in environmental decision-making that may impact their rights. Ultimately, access to effective remedies for violations of environmental human rights is also crucial, whether the violations are of procedural rights or substantive rights.

Substantive environmental human rights may be expressed as an overarching substantive environmental right, subdivided into substantive components, or expressed in relation to other substantive human rights. The overarching substantive right to a safe, clean, healthy, and sustainable environment is found in many but not all constitutions around the world. This overarching environmental right may be subdivided into components: the right to breathe clean air; the right to a safe climate; the right to safe drinking water and sanitation; the right to healthy and sustainably produced food; the right to nontoxic environments in which to live, work, study, or play; and the right to healthy biodiversity and ecosystems (Seck 2020b). The recognition that without adequate environmental protection, other human rights are impossible to fully enjoy may be described as the “greening” of other substantive rights, such as the right to life, the right to security of person, the right to privacy, or the right to culture.

Those who are most vulnerable to environmental harm, or at particular risk from environmental harm, may require additional measures to adequately protect their rights. As a result, attention to equity and nondiscrimination is the third component of an environmental human rights approach. Both direct and indirect discrimination must be avoided in order to ensure everyone has meaningful access to information, participation, and remedies with regard to environmental harms, and the siting of hazardous facilities does not contribute to environmental racism. Vulnerability to environmental harm may arise for some people due to a denial of their human rights, whereas for others it may arise due to their unusual susceptibility to environmental harm. Those commonly

identified as most environmentally vulnerable or at risk from environmental harm include children, women, the elderly, the disabled, the poor, displaced persons, and ethnic, racial, or other marginalized minorities (Knox 2018). Indigenous peoples and other traditional local communities are particularly vulnerable to environmental harms due to the close and often reciprocal relationships they have with the natural ecosystems of their ancestral territories. Indigenous peoples are entitled to recognition of their unique rights including to free, prior and informed consent before measures are taken that may impact their environmental human rights. As the holders of traditional ecological knowledge, their meaningful inclusion in environmental decision-making is crucial to the sustainability of their territories.

## **Business Responsibilities and Environmental Change**

The 2011 United Nations Guiding Principles on Business and Human Rights (UNGPs) do not make explicit reference to the responsibility of business enterprises to respect environmental rights as they do with regard to labor rights. However, it is important to read the UNGPs in light of the 2018 Framework Principles on human rights and environment, among other sources designed to clarify the content of environmental human rights. Principle 12 of the 2018 Framework Principles confirms that it is the responsibility of states to effectively enforce environmental standards against businesses as well as public sector actors. However, the business responsibility to respect human rights as confirmed by the UNGPs includes “the responsibility to avoid causing or contributing to adverse human rights impacts through environmental harm, to address such impacts when they occur and to seek to prevent or mitigate adverse human rights impacts that are directly linked to their operations, products or services by their business relationships” (Knox 2018). All businesses must comply with all applicable environmental laws and so meet the substantive environmental standards established by states. However, if the environmental standards set by the state are inadequate to protect

the environmental human rights of vulnerable groups, or enforcement of these laws is not effective, then compliance with state law will not be sufficient for a business to meet its own independent responsibility to respect rights. In accordance with the UNGPs, the 2018 Framework Principles provide that all businesses should “issue clear policy commitments to meet their responsibility to respect human rights through environmental protection, implement human rights due diligence processes (including human rights impact assessments) to identify, prevent, mitigate and account for how they address their environmental impacts on human rights, and enable the remediation of any adverse environmental human rights impacts they cause or to which they contribute” (Knox 2018).

The business responsibility to respect environmental human rights emerging from the UNGPs is often described as a responsibility to do no harm. However, other responsible business conduct guidance tools, such as the United Nations Global Compact, describe this responsibility as also imposing a positive duty to support human rights (UNGC n.d.). This is particularly important with regard to environmental human rights defenders who may be targeted by their own state should the state prioritize economic development over environmental protection to the detriment of rights holders. In this situation, the responsibility of business is to promote and advance human rights, becoming a champion of human rights, and so provide support to environmental human rights defenders.

An environmental human rights approach to business responsibility is also consistent with the 2030 Sustainable Development Goals (SDGs). The SDGs seek to achieve gender equality and to realize human rights and are to be implemented by all stakeholders in partnership, including by the business sector. The need to realize environmental human rights is implicit in many of the individual SDGs, while procedural environmental rights are reflected in SDG 16 which is concerned with peace, justice, and institutions (Seck 2018). Nevertheless, critiques of the sustainable development agenda raise concerns that the endorsement of economic growth (even if “green”) cannot be consistent with the imperative that

development remain within the limits of planetary boundaries (Atapattu et al. 2021). A circular economy approach that integrates responsibility for environmental human rights may be one way to overcome this concern.

An environmental human rights approach to business responsibility is also evident when the environmental chapter of the OECD MNE Guidelines is interpreted in light of the human rights chapter added in 2011. The 2018 OECD Due Diligence Guidance for Responsible Business Conduct provides clarity on the relationship between the two, as it confirms the expectation of the UNGPs that business enterprises will carry out due diligence to identify, prevent, and mitigate adverse impacts, whether existing or potential, across their operations and business relationships, and then account for how they address these impacts (OECD n.d.). As environment-related examples are integrated throughout the 2018 Due Diligence Guidance including in relation to waste management, climate change, and biodiversity, while additional examples draw attention to the situation of environmental human rights defenders. Sector-specific RBC guidance tools developed by the OECD also increasingly integrate an environmental human rights approach. For example, the 2017 OECD Due Diligence Guidance on Responsible Supply Chains in the Garment and Footwear Sector provides that businesses should identify potential and actual environmental harms in their operations and supply chains through risk scoping and supplier assessments, with attention to hazardous chemicals use, water pollution, and greenhouse gas emissions. Specific instance complaints raising environmental human rights concerns in relation to business conduct may be brought to National Contact Points established by adhering states to the OECD MNE Guidelines.

Integration of an environmental human rights approach to responsible business conduct is also slowly emerging in the context of children’s rights and worker’s rights (Seck 2018). This integration is evident where attention is paid to the implications of toxic substances on the health of workers, but also where attention is paid to workers as the parents of children who are unusually susceptible to environmental human rights harms. In this case,

a lack of access to decent living conditions for female garment sector workers, for example, may have a disproportionate negative impact on their children who may lack access to unpolluted drinking water.

## Conclusions

While there is increasing evidence that environmental human rights concerns are being integrated into corporate responsibility or responsible business conduct guidance tools, these developments are very recent and are not yet comprehensive. For example, a fulsome consideration of the business responsibility to respect human rights in light of climate change is only recently emerging, and its exact counters remain contested (Seck 2020a). Meanwhile, the implications of plastic pollution on human rights is an area of increasing concern, as are the implications of biodiversity loss on human rights. It is anticipated that these and other environmental change issues associated with global ecological crisis will receive close attention in future RBC guidance tools. Ethical business practice demands attention to environmental human rights concerns.

and Social Sciences, London, UK

## Synonyms

Business and human rights; Corporate respect for human rights; Human rights responsibilities of large corporations

## Introduction

A multinational corporation (MNC) is defined simply as a company that owns property or operates in at least two countries. Today, such

corporations are common and take many forms (Muchlinski 2007). Smaller MNCs may operate in only two countries and engage primarily in cross-border trade. Others may operate across a broader regional area. Increasingly MNCs do not merely own facilities or otherwise control production in multiple locations but operate subsidiary companies abroad. This may be for the purposes of selling in new markets, such as the parent company Starbucks coffee owning a subsidiary in China with the same branding and products. Subsidiaries also allow companies to enter new sectors, with Starbucks having owned subsidiaries producing bottled water, a record label, and a bakery chain. Subsidiaries can serve a third purpose of separating assets to reduce liabilities or to minimize tax liabilities, following the possibilities for profit maximization contained within company law. Another type of MNC is the investment fund or private equity firm. These are companies that invest in or purchase other companies, either because they are a good immediate investment or because the managers believe the company has untapped potential. Blackstone, a self-described “investment business” that combines private equity purchases with hedge fund investments, claims on its website to “support” over 200 companies. These firms will have a constantly rotating portfolio of companies under their management and the buying and selling, merging, and splitting, of companies is a core part of their business strategy.

MNCs therefore move from simple mercantilist firms engaging in cross border trade to sprawling entities so diverse that directors may not know every company under their control. From the human rights perspective, this diversity of scale and form naturally entails differing possible impacts on human rights (Kinley and Joseph 2002). One major distinction would be the feasibility of an MNC evading local home state regulation by outsourcing or relocating abroad, something of which not every MNC would be capable. The diversity of sectors is equally important, with MNCs operating across most business lines. Mining, agriculture, and factory production

each carry well known human rights risks, while MNCs that produce or control essential resources such as pharmaceuticals or housing have an innate relationship with the fulfillment of human rights.

MNCs today display at least three major relationships with human rights. First, they are deeply involved in the production of essential human rights resources, from jobs to houses to medical care; second, they are frequently criticized for their impacts upon human rights; and third, they increasing talk about human rights issues, from specifics such as racial justice in the USA, to generalized “respect” for human rights following international standards (Birchall 2019). Other entries in this encyclopedia talk about human rights as related to business in various ways, and so this entry will focus specifically on the nature of the large MNC, what it means to consider such business behemoths to hold human rights responsibilities, and how these powerful entities understand and construct their own responsibilities.

## MNCs and Respect for Human Rights

MNCs are asked by the most relevant standards to “respect” human rights. But what exactly does it mean for a multinational conglomerate, which owns numerous subsidiaries, works with even more suppliers, and touches upon almost every industry, to respect human rights? Respect can mean many things. At its most basic, respect entails non-violation, or non-intrusion in the life of another. A landowner respects her neighbor’s land by not interfering with it in any way. But respect, including in the human rights context, often suggests more. Respect can mean recognizing the humanity, the dignity, of others, recognizing that the other is also valuable. Respect can take a broader perspective of the respectful citizen, the citizen that acts respectfully towards her whole community.

Respect meaning non-violation has the advantage of allowing neat delineations to be drawn. But neither an individual nor an MNC can legitimately claim to be “respectful” by merely

avoiding overt intrusion upon others. The primary reason for this is because social life entails the constant interaction of individuals with one another, and of MNCs with numerous people, places, companies, and governments. Non-intrusion can work to set some limits, but lives intrude and intertwine by their nature. We respect our neighbors not by limiting our intrusions and attacks upon their dignity, but by fully recognizing and valuing that dignity. A homeowner is not respecting her neighbors by always keeping just below the legal minimums of noise levels, of home disrepair, and of littering. This person would be universally understood to be a bad, disrespectful, neighbor, and that she made sure she never quite breached a law would only make her more disrespectful, a calculated disrespect designed to maximize her own self-interest to the detriment of her community while carefully avoiding sanction.

Yet when it comes to MNCs respecting human rights, this is the general approach employed. It is publicly accepted that corporations will try maximize their self-interest within legal limits, including of pollution, of labor exploitation, and of profiting from reduced access to essentials. A corporation that, over many years, manages to tow this line without serious allegation of breach is to be regarded as a particularly good corporation, a leader in the field of responsibility, despite potentially serious community impacts (Bravo et al. 2020). One reason we make this distinction is because the corporation is too large and rootless to be held to any serious community standard. Labor supply chains, for example, are rooted in a kind of original sin of companies abandoning their hometown workforces to pursue cheaper labor options in the developing world. Any attempt to enforce respect for the dignity of its new workforce is always going to be a limited by this context. Because free-moving capital with its ability to select a new labor force almost at will is a fundamental norm – as unchallengeable as laws of physics, it seems – respect for this labor force must fit within that labor force also being the most profitable (Baars 2016).

Discrete definitions are often employed to construct a non-intrusion form of respect in innately intrusive situations, of which employment is the most obvious example. Minimum standard labor rights, including the prohibition on child labor and a basic needs wage do not come close to guaranteeing or even fostering a respectful workplace, but instead set limits on how far dignity can be intruded upon. The notion of “freely chosen” work bears a great deal of weight in such situations, with work that is not overtly coerced considered at least minimally non-intrusive, and the most progressive programs encouraging decent wages and hour limits as well. None attempt to ensure comprehensive respect for workers, such as managers would be obligated to maintain in industries suffering labor shortages. What it means to “respect” another can be highly circumstantial (Birchall 2019a).

## BlackRock and Respect for Human Rights

To look closer, this entry turns to one such MNC, the investment manager BlackRock. BlackRock is one of the largest investors in the world, owns numerous companies, and is heavily invested in human rights-relevant areas. It is also famous for its CEO, Larry Fink, writing an annual letter that focuses heavily on the human rights responsibilities of BlackRock and of business and investors more generally. How does BlackRock understand its human rights commitments?

In a 2021 statement on their commitment to human rights, BlackRock wrote that “[i]t is our conviction that our clients, as long-term shareholders, benefit when companies operate their businesses responsibly. Unmanaged potential or actual adverse human rights issues can not only harm the people directly affected, but also expose companies to significant legal, regulatory, operational, and reputational risks.” Rogge (2021) argues that in BlackRock’s approach “human rights risks to people are treated instrumentally insofar as such risks have potential to rebound

onto investors.” Human rights are relevant because they may adversely impact investor profits. While this approach is clearly ripe for critique, it must be remembered that BlackRock exists to make their investors money and owes fiduciary duties to ensure they attempt to do this as best they can. It may be unwise to expect too much. However, BlackRock is an interesting case because the organization claims to care strongly about human rights, to be trying to do good, and explicitly argues that human rights “issues” are bad for business. This then begs the question of what BlackRock means by human right issues, of how they understand human rights risks as risks to business.

Although BlackRock does not provide a definitive list of human rights issues that it considers relevant, it highlights poor working conditions including forced labor, community harm such as infringing on indigenous peoples’ rights, discrimination, and privacy issues. Because these issues are explicitly relevant because they may cause risks to the business, such as reputational harm, strikes, or jeopardizing access to resources, we can assume that BlackRock is more interested in the more egregious forms of these problems, as well as those forms around which activism is more developed. If certain forms of harm to rights will not cause such risks, BlackRock may be content to cause that harm.

BlackRock clearly follows a business case understanding of human rights responsibilities and rationality. The business case for human rights is the idea that causing human rights violations is bad for business and respecting rights can be a boon for business, for reasons of consumer reputation, industrial relations, and community satisfaction. This is often juxtaposed to law as its antithesis, with law relying on coercive force where the business case relies on management incentives. However, at least in terms of the issues, of which human rights, and of which problems, are considered important, there is a strong degree of overlap between the two. Simply, the issues that are frequently prohibited in law are also the issues that business case instrumentalism

is most likely to focus upon where they are not legally prohibited. Lawmakers operate within a similar normative paradigm to business managers, both groups seek to act over a similar group of issues, and to ignore the same groups of issues.

This is seen in one major recent policy shift by BlackRock, their investment in housing, particularly in the USA and with an eye toward evictions and mortgage arrears following the end of COVID-related policies such as the moratorium on evictions. Following in the highly profitable footprints of investment firm Blackstone (Birchall 2021), BlackRock has started buying up homes to be used as rental properties, from houses to apartment blocks, and attempting to purchase significant chunks of neighborhoods. This business decision will limit access to affordable housing and will mean that many individuals who would have been homeowners building nest eggs will instead become lifelong renters without an asset to fall back on. It should be obvious to a human rights-focused company that this choice is not beneficial to access to housing. They are not building housing, they are merely using their enormous reserve funds to buy (over market value) as many homes as possible and to control those markets.

Such decisions reveal as much about human rights ideology as they do about BlackRock. BlackRock takes seriously those human rights issues that are popularly considered to be major problems. BlackRock considers that it can profit from reducing access to affordable housing, despite this being a core element of the human right to housing, because it does not generate a serious level of human rights condemnation. It is a more vexatious problem than some. Forced labor, for example, is a directly coercive act, while BlackRock’s ownership of a large segment of a housing market does not directly coerce any individual. But it does create a structure in which home ownership is much more difficult, in which renting becomes much more common, and therefore in which lower income people are forced to devote a large portion of their incomes to funding BlackRock’s profits rather than building

their own assets. Such a structure generates poverty and economic insecurity and is one important causal factor in well-known trends toward rising in-work poverty, child poverty, and, in the UK, use of food banks. We cannot blame BlackRock or other housing investors for these trends in the same way that we can establish causal responsibility for forced labor, but equally it does not take an enormous leap of faith to see that such investment choices are one important element of a deleterious social matrix, in which investor profit takes precedence over social need.

## The Contemporary MNC and Human Rights

BlackRock is emblematic of the contemporary MNC. It is vast, with tendrils in numerous sectors. Its investors reap huge profits and its directors are billionaires. It talks human rights, responsibility, and positive purpose with gusto. But BlackRock's core mission is to make profit. Human rights concerns are only relevant insofar as they threaten this profit. This allows for an enormous scope of activity that appears to threaten access to housing, or to exploit workers, or exacerbate climate change, but which, due to the matrix of norms that constitute human rights priorities, can be done without threatening profit. Nonetheless, BlackRock does respect human rights relatively well according to the contextual norms of what it means for an MNC to respect human rights.

BlackRock's engagement with human rights reveals the social structure of contemporary human rights concerns and their relationship with business self-interest (Chadwick 2021). When BlackRock states that respecting human rights is good for business, it refers only to a specific set of well-known human rights abuses. As MNCs grow and take control of more and more elements of life, particularly supplying essential resources, it may become necessary to take a more comprehensive view of human rights responsibilities and social justice as connected to business.

## Human Rights Duties Towards Future Generations and Achieving Climate Justice

Bridget Lewis

School of Law, Queensland University of Technology, Brisbane, Qld, Australia

### Synonyms

Climate change; Climate justice; Future generations; Intergenerational justice; Human rights

### Introduction

As the world grapples with the reality of a rapidly changing climate, two dimensions of the problem have become increasingly clear. Firstly, climate change threatens the enjoyment of human rights in diverse and serious ways. Secondly, the impact of climate change on the enjoyment of human rights will persist into the future, even if mitigation and adaptation efforts are stepped up significantly. The impact of climate change on future generations has been recognized as a form of climate injustice, as future generations have not contributed to the problem of climate change but will inevitably endure its worst effects.

The discussion below will explain intergenerational climate justice and examine how it could be advanced through the recognition of human rights duties toward future generations. It will address both moral and legal understandings of future generations' human rights and introduce some of the contemporary legal approaches being utilized to enforce stronger climate action and, ultimately, to achieve intergenerational climate justice.

### Climate Justice

Climate justice has both intra- and intergenerational dimensions, though until recently the focus of the international climate

regime has been on achieving the former, with relatively little attention given to the latter.

### Intra-generational Justice

At the level of the international climate regime, intra-generational climate justice seeks to distribute the burdens of climate change fairly among developed and developing states, having regard to their different capacities for adaptation and mitigation. It seeks to account for the fact that developed states have historically contributed more to the problem of global greenhouse gas emissions, and continue to do so. It also acknowledges the differential impacts of climate change and the fact that some of the worst environmental consequences are predicted to affect the Global South (Shue 2014).

The need for climate justice is reflected in the international climate regime through the principle of common but differentiated responsibilities (CBDR). CBDR was first articulated in 1992 in the *Rio Declaration on Environment and Development*, Principle 7 of which says:

In view of the different contributions to global environmental degradation, States have common but differentiated responsibilities. The developed countries acknowledge the responsibility that they bear in the international pursuit of sustainable development in view of the pressures their societies place on the global environment and of the technologies and financial resources they command. (United Nations Environment Programme, 1992)

The concept was also translated into *United Nations Framework Convention on Climate Change* (UNFCCC), where it is included as a core principle guiding the international response to climate change (UNFCCC 1992, art 3).

At a more local level, intra-generational climate justice recognizes the fact that climate change affects different communities and individuals in different ways. It is similar to the concept of environmental justice (Schlosberg 2007), which recognizes that poor and marginalized communities, people with disabilities, Indigenous peoples, and minority groups are often disproportionately affected by environmental conditions. This is also true of climate change, and climate justice emphasizes the need to protect those who are most vulnerable to the impacts of global warming (Shue 2014).

## Intergenerational Justice

The injustice of climate change is also evident in a temporal, and not just a geographic, sense. The impacts of climate change will continue to manifest for centuries to come. This will be the case even if we achieve rapid reductions in greenhouse gas emissions in the near future, owing to the long-term effects of carbon already in the atmosphere and the thermal inertia of the world's oceans (Allen et al. 2018; Mauritsen and Pincus 2017). Consequently, future generations will inevitably experience the serious environmental consequences of our past and contemporary emissions. Because they have not contributed to the causes of climate change, the impacts which future generations will inevitably endure constitute a form of climate injustice (Lawrence 2015). This injustice is compounded by the obvious fact that future generations cannot advocate for their own interests or contribute to decision-making around climate policy.

The concept of intergenerational climate justice can be understood and addressed through its connections to the theory of intergenerational equity. The most well-known definition of intergenerational equity comes from Edith Brown Weiss (1989, 2008), who argued that current generations have an obligation not to leave the planet in any worse condition than when they found it. This obligation includes ensuring that future generations have equitable options, quality, and access in relation to the natural resources they will inherit from current generations.

As a general principle, intergenerational equity has a long history within international environmental law.

Versions of the principle are included in a number of specific environmental law treaties, such as the *International Convention for the Regulation of Whaling* (1946) and the *Convention on Biological Diversity* (1992), where it is employed to encourage states to conserve natural resources for the benefit of future generations. It can also be found in soft law instruments like the *Stockholm Declaration on the Human Environment* (1972) and the *Rio Declaration* (1992), with the latter recognizing the important link between intergenerational equity and sustainable development.

The international climate regime recognizes the importance of intergenerational climate justice in limited ways. The principles underpinning the UNFCCC (1992) state that “Parties should protect the climate system for the benefit of present and future generations of humankind, on the basis of equity and in accordance with their common but differentiated responsibilities” (art 3). The *Paris Agreement* (2015) notes “the importance for some of the concept of ‘climate justice’” and includes intergenerational equity among several other considerations which states should take into account (preamble paras 11 and 12).

Paragraph 11 of the Preamble to the *Paris Agreement* states:

Acknowledging that climate change is a common concern for humankind, Parties should, when taking action to address climate change, respect, promote and consider their respective obligations on human rights, the right to health, the rights of indigenous peoples, local communities, migrants, children, persons with disabilities and people in vulnerable situations and the right to development as well as gender equality, empowerment of women and intergenerational equity.

While this paragraph recognizes various cohorts who deserve climate justice, its location in the Preamble means that it is not legally binding on states parties. Furthermore, intergenerational equity is just one of many considerations which need to be balanced, but there is no guidance for how that balancing should occur. States are therefore not legally obliged under the climate regime to protect the interests of future generations specifically and the iterations of intergenerational climate justice at the international level are limited.

At the national level, a small number of countries have dedicated mechanisms to advance the interests of future generations, and these have potential for achieving climate justice. For example, Hungary's *Fundamental Law* (2011, s3(1)) includes protections for future generations. The Ombudsman for Future Generations has been created to monitor compliance with this law and investigate issues which impact on future generations' interests (Szabó 2015). In Wales, the *Well-being of Future Generations Act 2017* creates obligations for public entities to consider the

long-term impacts of their decisions and act to prevent negative impacts on future generations. It establishes the Future Generations Commissioner, whose role is to be a guardian for future generations and oversee compliance with the Act (s18).

There is also a body of legal jurisprudence emerging out of litigation that seeks to protect future generations' interests in climate decision-making. In some countries these cases rely on constitutional rights and duties to protect the interests of future generations (*Demanda Generaciones Futuras v Minambiente* 2018; *Neubauer et al. v. Germany* 2021) while others are based on legislative or common law duties of care toward children or future generations (*Sharma v Minister for the Environment* 2021; *Milieudefensie et al. v Royal Dutch Shell PLC* 2021).

These cases are starting to fill the gaps in the international climate regime in order to better protect the interests and rights of future generations from the inevitable harms of global warming. The next section turns to consider how human rights law and principles can further contribute to intergenerational climate justice.

## Human Rights of Future Generations

Climate change interferes with the enjoyment of many human rights that are recognized in international and domestic laws. Severe weather, poor air quality, rising sea levels, and increased temperatures are already impacting on rights to health, housing, food, and water, as well as Indigenous peoples' rights to land, culture, and self-determination (Knox 2016; Committee on the Elimination of Discrimination Against Women et al. 2019). These human rights impacts will equally be felt by future generations, perhaps even more so as climate change worsens over time. With this in mind, scholars and advocates have started exploring how human rights-based approaches might provide a means of protecting future generations' interests and securing stronger action on climate change.

In simple terms, a human rights-based approach can apply where a rights-holder possesses particular rights, usually recognized under a relevant legal framework. Those rights impose corresponding obligations on a duty-bearer, and usually include duties to respect, protect, and fulfill the relevant rights. Where a legal framework is in place, the duty-bearer can be compelled to act consistently with their duties, or be found in violation of the law if they fail to do so. Such an approach could potentially be applied in favor of future generations provided that 1) future generations can be thought of as rights-holders under the relevant framework; 2) a corresponding duty-bearer can be identified; and 3) laws or processes are in place which enable the duty-bearer's obligations to be enforced.

## Do Future Generations Have Rights and Do We Owe Them Duties?

The first two issues (rights-holders and duty-bearers) have both theoretical and legal dimensions. There has been some debate among moral and political philosophers about whether future generations can be said to possess human rights. One approach relies on what Gosseries (2008) describes as "right-bearer contemporaneity": rights only exist when the person exists. Macklin (1981), for example, has argued that rights can only exist with respect to "actual persons," and cannot therefore belong to persons not yet born. Parfit's (1984) "non identity problem" is another argument against recognizing future generations as holders as rights. Parfit argues that our actions today determine not only what kind of world future generations will live in, but also the specific identities of those future persons. Consequently, we cannot be said to owe obligations to future generations to act in one way or another because, if we act differently, we change the identity of people who will come into existence. The very existence of future generations depends on our *not* acting differently.

However, these arguments are counter-intuitive to the general sense that we ought to be concerned about the future consequences of our

actions, and are clearly inconsistent with the thinking that underpins intergenerational justice. There are alternative theories of human rights which are more open to recognizing the rights of future generations. The “interest theory” of rights developed by Raz (1986) and Feinberg (1981) is one such example. It defines human rights as interests that are weighty enough to impose obligations on others. Applying this approach, as long as we can conceive of future generations having interests, we can conceive of their having rights. This does not change because we cannot know the precise identity of those future persons; we know that future persons will exist and that they will have interests, and that is a sufficient basis to say that they will possess rights (Feinberg 1971). From this basis, scholars like Caney (2006) and Bell (2011) have argued strongly that current generations have obligations to address climate change because of the impact it will have on future generations’ rights.

### Can Future Generations’ Rights Be Legally Enforced?

In theory then, it is possible to say that future generations have human rights and that current generations have obligations to protect those rights. The legal enforcement of those obligations in the context of climate change is somewhat more problematic, however, as few legal frameworks recognize the rights of future generations.

At the international level, human rights treaties do not include future generations among the people to whom states owe obligations, at least not explicitly. International human rights law usually stipulates that states owe duties to persons under their jurisdiction. Traditionally this has been thought to impose both territorial and temporal limits on states’ duties, with the result that states have not been compelled to protect the rights of future generations.

However, some recent developments have shown that this bounded approach to human rights duties may be opening up. A recent joint statement of United Nations human rights committees explained that, in relation to climate change:

State parties have obligations, including extra-territorial obligations, to respect, protect and fulfil all human rights of all peoples. Failure to take measures to prevent foreseeable human rights harm caused by climate change, or to regulate activities contributing to such harm, could constitute a violation of States’ human rights obligations. (Committee on the Elimination of Discrimination Against Women et al., 2019, para 1)

Given the foreseeability of climate impacts on future generations, this approach plausibly supports duties to protect their rights.

The Inter-American Court of Human Rights has also expanded its interpretation of states’ duties under the *American Convention on Human Rights* (1969). In a recent Advisory Opinion on environmental human rights, the Court stated that duties to respect and ensure human rights arise whenever a state exercises “effective control” over an action that causes environmental damage, even when that damage occurs outside its borders (Inter-American Court of Human Rights, 2017). While this reasoning is most directly relevant to extra-territorial human rights duties, it opens up potential for a state to be held responsible for the future consequences of its greenhouse gas emissions.

As noted above, emerging judicial interpretation of duties also gives much greater regard to future generations’ interests. Often, however, the potential for courts to protect future generations’ rights is stifled by rules of standing and admissibility. International human rights law often limits admissible claims to situations where harm has occurred or is imminent, and more remote claims may be rejected even where the harm is foreseeable (*E.W. et al. v. The Netherlands* 1993; *Beydon v. France* 2005).

At the domestic level, some states provide dedicated processes to enable claims on behalf of future generations (as noted above) but many lack these sorts of pathways for future generations’ claims to come before the court. One way around this is evident in the increasing trend of climate litigation being brought by children and young people. For example, a group of children and young adults is challenging the approval of a

new coal mine in Queensland, Australia, on the basis that the resulting climate change will violate their rights under the *Human Rights Act 2019* (*Waratah Coal v Youth Verdict*, 2020).

At the international level, cases are currently on foot in both the European Court of Human Rights and the Committee on the Rights of the Child in which children are arguing that states' failures to address climate change constitute a breach of their human rights (*Cláudia Duarte Agostinho and others v Portugal and 32 Other States*; *Sacchi et al.* 2019). In this way future generations' rights can be protected without relying on the rights of generations not yet born.

### Can Human Rights Deliver Climate Justice for Future Generations?

Climate change presents a number of challenges for human rights frameworks, because it does not fit the usual template for a human rights violation. The long-term, cumulative, and transboundary nature of climate change does not sit comfortably within the usual model of a human rights violation, in which the acts or omissions of a single government have caused an interference with the rights of an identifiable individual or group. Previously this has been thought to place a significant limit on the utility of human rights in addressing climate injustice, particularly intergenerational injustice.

However, more recent developments in national and international jurisdictions suggest that this way of thinking may be shifting. Increasingly, courts are using the concept of intergenerational equity to interpret states' obligations and recognizing responsibilities to protect future generations from the serious harms of climate change. While the rights of future generations are rarely recognized explicitly in human rights laws, the links between human rights and climate justice are being explored in litigation within different legal frameworks. Human rights provides a way of understanding and communicating the future impacts of climate change and can be used to frame states' obligations to take stronger action. This approach gains additional

power because of the close links between human rights law and its moral and theoretical foundations. Human rights can advance the interests of future generations by highlighting our moral and legal obligations toward them, and in so doing has potential to contribute to intergenerational climate justice.

## Human Rights Impact Assessments

Simon Walker

Office of the United Nations High Commissioner for Human Rights (OHCHR), Geneva, Switzerland

## Synonyms

Business; Due diligence; Impact assessment; Methodology; Participation; Trade

## Introduction

Discussions about HRIAs began in the 1990s. Impetus came originally from discussions on rights-based approaches to development as well as increasing donor requirements for monitoring and evaluation of human rights program and projects (Landman 2006). However, HRIA did not grow in a vacuum and drew significantly on the larger knowledge and practice related to environmental impact assessment and social impact assessment (Walker 2009).

Today, an increasingly significant body of methodologies and practice exists. Perhaps the most important area has been the development of HRIAs in the context of business projects and activities, in large part due to the endorsement of the *United Nations Principles on Business and Human Rights* (UNGPs) by the United Nations Human Rights Council (UNHRC 2011a). The UNGPs establish the soft-law responsibility of business enterprises to respect human rights,

---

The contents of this work represent the author's own views and do not represent the views of the United Nations.

together with reiterating the State responsibility to protect human rights in the context of business activities and the right of victims of human rights violations to a remedy. As part of the business responsibility to protect, the UNGPs encourage businesses to undertake human rights due diligence to identify, prevent, mitigate, and account for its impacts on human rights as a result of its activities (UNHRC 2011a). HRIAs have a key role to play in the due diligence process by identifying the potential impact of business projects and activities as a means to prevent and mitigate potential negative effects on human rights (Götzmann 2019).

HRIA methodologies and practice have also grown in other fields. Analysis of the impact of trade agreements on human rights in the early 2000s led to calls for HRIAs of trade and investment agreements (Walker 2019). This led to the development of methodologies and practice (Walker 2009; Harrison 2010). The most significant boost to HRIAs of trade and investment agreements has been the integration of human rights into the European Commission's Trade and Sustainability Impact Assessments (European Commission 2015). As a result, HRIA is integrated into economic, social, and environmental impact assessment of all potential trade and investment agreements entered into by the European Union prior to negotiations. In addition, some civil society organizations have also undertaken HRIAs of trade and investment agreements (e.g., Braunschweig et al. 2014; Paasch et al. 2011). HRIA knowledge and practice has also developed to assess impacts of other areas such as assessment of respect for the right to food in the development context and assessment of the impact of policies and projects on women's health rights, to name just several.

There is no single definition of HRIAs. One definition describes HRIAs in the following terms: "human rights impact assessment measures the impact of policies, programmes, projects and interventions on human rights" (Walker 2011). In the business context, HRIAs have been defined as "a process for identifying, understanding, assessing and addressing the adverse effects of a

business project or activities on the human rights enjoyment of impacted rights-holders such as workers and community members" (Felner 2013; Götzmann et al. 2016). The next section expands on some of the elements of these definitions.

## Process

Importantly, an HRIA is a particular rigorous process or methodology used to assess impact of policies and other interventions on human rights. This process draws on many aspects of EIA and SIA methodologies, and in many aspects, there is considerable overlap between these various impact assessment methodologies. While the process might need to be adapted to each particular assessment, it generally involves the following steps (Walker 2009):

- Preparation – the establishment of the objectives and terms of reference of the assessment
- Screening – the identification of those aspects of a policy, program, project, or activity which should be subject to assessment, for example due to the risks they might pose to human rights enjoyment
- Scoping – the elaboration of those aspects of the policy, program, project, or activity so that it is fully understood and described in a way that real or potential impacts can be identified and measured. Where the policy, program, project, or activity is yet to be implemented, this might require establishing several scenarios to describe how it might play out
- Data collection and analysis – the collection of qualitative and quantitative data and its analysis to understand the real or potential short- and long-term impacts of the policy, program, project, or activity on human rights
- Conclusions and recommendations – the description of positive, negative, or inconclusive impacts on the enjoyment of human rights and the identification of steps to avoid or remedy negative impacts or amplify positive impacts

- Monitoring and evaluation – re-assessment of the policy, program, project, or activity after a period of implementation

## Timing

HRIAs might be *ex ante* or *ex post*. An *ex ante* impact assessment examines the potential future impact of a policy, program, project, or activity on the enjoyment of human rights. It seeks to understand the possible impact so as to influence the direction of the policy, program, project, or activity prior to its implementation (Walker 2011). An *ex post* impact assessment examines the real human rights impacts as a result of the implementation of an existing policy, program, project, or activity (Walker 2011). In some cases, *ex ante* and *ex post* impact assessments might be combined, for example, where an *ex ante* assessment makes a recommendation for an *ex post* assessment after several years of implementing a policy, program, project, or activity. Alternatively, an *ex post* impact assessment might consider some possible future changes to the policy, program, project, or activity and undertake a quick *ex ante* assessment of the likely human rights impacts of these changes (Walker 2011). The question arises whether an *ex post* HRIA is nothing other than human rights reporting on a situation following a particular intervention (Duong 2015). The overlap between *ex post* HRIA and other human rights reporting is potentially significant. However, a distinguishing factor of HRIAs, including *ex post* HRIAs, is the rigorous process employed, as outlined above.

## A Human Rights Framework

While the steps outlined above are common to many impact assessments, HRIA should apply a human rights framework to that methodology. That means that the assessment should:

- Examine the impact of the policy, program, project or activity on specific human rights, as

recognized in national legislation and in international treaties

- Examine the extent to which the process of formulating the policy, program, project, or activity respects human rights principles of non-discrimination, participation, transparency and accountability
- Ensure that the process underlying the assessment itself respects human rights principles, with a particular emphasis on popular participation

Applying the human rights framework to the impact assessment process underlines a number of important aspects of HRIAs. For example:

- The terms of reference, the analysis, and the conclusions and recommendations should explicitly refer to human rights standards. Human rights standards set out the definitions and parameters for each right which can help define a baseline below which the assessment might define a real or potential violation. For example, not all health impacts will amount to a right to health impact and human rights standards help to define what becomes a human rights concern.
- Conclusions should be clearly expressed in terms of how the policy, program, project, or activity affects human rights standards. Human rights include not only a set of freedoms and entitlements enjoyed by individuals but also a set of obligations on States and responsibilities on non-State actors. Conclusions should express how the policy, program, project, or activity affects both the freedoms and entitlements of individuals but also the capacity and willingness of States and non-State actors to meet their human rights responsibilities.
- The assessment should use participatory methodologies as much as possible. This places a particular emphasis on the use of qualitative methods, such as interviews and case studies, so as to understand the views and opinions of those affected. The assessment might also involve individuals and communities in the process of undertaking the assessment. While HRIAs emphasize the importance of

qualitative methods, quantitative methods are still often very important, depending on the object of the assessment. A mixed qualitative and quantitative methodology is generally preferred.

- The assessment should identify the diverse nature of people that might be affected by a policy, program, project, or activity. This helps to identify disparate impacts on people so as to avoid or treat discrimination and promote equality. Consequently, data should be disaggregated according to gender as well as other relevant aspects such as ethnicity, minority, disability, depending on the object of the assessment.
- The assessment should examine not only real and potential human rights outcomes resulting from the policy, program, project, or activity but also the extent to which the formulation and implementation of the policy, program, project, or activity respects human rights principles. For example, were individuals and communities consulted in the formulation of a business project proposal? Have policy-makers been transparent in sharing information about a policy with individuals and community members?

## Assessment Tools and Measurement

The scoping step should identify the relevant impact assessment tools. Given the nature of the human rights framework, data collection and analysis tools should span both quantitative and qualitative methods. These include statistical methods, economic modeling, surveys as well as participatory assessment methods, and expert analysis (Walker 2009).

The identification of indicators is a crucial way to focus data collection and analysis and provide a basis for statements on human rights impact (Walker 2011). Indicators help to guide measurement as well as promote transparency in measurement (Braunschweig et al. 2014). Where indicators are not referred to explicitly, or are referred to inconsistently through the assessment, measurement becomes “opaque and disconnected” (Walker 2018). Each HRIA therefore should identify an appropriate set of indicators,

in relation to the policy, program, project, or activity under examination. The human rights indicator framework developed by the Office of the High Commissioner for Human Rights provides a helpful framework to be adapted to each assessment exercise (OHCHR 2012).

The OHCHR framework sets out three categories of indicators, namely:

- Structural indicators that measure *commitment* to a particular aspect of a right – an indicator might be the time frame and coverage of the national policy on sexual and reproductive rights
- Process indicators that measure *effort* to achieve a particular right – for example, the proportion of births attended by skilled health professionals
- Outcome indicators that measure the *result* of the commitment and effort combined on the enjoyment of human rights – for example, the maternal mortality rate

## Actors Involved

A range of different actors have been undertaking HRIAs to date (Götzman 2019; Walker 2019). These include:

- Business enterprises – where business enterprises carry out an assessment in-house. One issue that has arisen here is the question of transparency, both of the process of the assessment but also the results which are not always made public.
- Commissioned assessments – where a State, a group of States such as the EU, or a company commissions a group of experts to undertake an assessment. By commissioning external experts, this can help promote greater independence and transparency in the assessment process, and ideally greater reliability of the results.
- Community-based assessments – where a civil society organization or a community itself evaluates the impact of a policy, program, project, or activity. These assessments are generally characterized by a high level of community participation although those undertaking the assessment do not always have

sufficient access to State and business actors when undertaking the assessment and disseminating the results.

- Multi-stakeholder assessments – where a combination of community, business, and/or State actors engages in a collaborative process to design and implement the assessment. While having great potential, the approach has not been tried in practice.
- States – where a Government agency carries out an assessment such as an impact of a particular policy on promoting equality.
- Regional organizations – where a group of States such as the European Union requires assessment of policies and other interventions prior to their adoption.

## Opportunities and Challenges

The growth in HRIAs continues and there is a growing impetus to encourage HRIAs. Most notably, the due diligence provisions of the UNDPs have led business enterprises and civil society organizations to invest more significantly in undertaking HRIAs. In the area of HRIAs of trade agreements, the requirement that the EU's Trade and Sustainability Impact Assessments (TSIAs) must integrate human rights analysis has also been an important impetus to undertake HRIAs. This has led to an increase in both methodologies and guidance but also practice (Gotzmann 2019; UNHCR 2011b; Harrison 2010; Walker 2009). Today, there is comprehensive guidance on undertaking HRIAs and a growing pool of practice (Gotzmann 2019).

However, HRIAs also face challenges. First of all, HRIAs tend to be involved and therefore timely and expensive to do convincingly. Much will depend on the focus of each particular assessment exercise, yet to take the example of the European Commission's TSIAs, the assessments take some 2–3 years to complete with budgets in the realm of several hundred thousand Euros (Walker 2019). In addition, HRIAs require a range of skills, including not only human rights lawyers but also often economists and social scientists so that expertise covers human rights as

well as qualitative and quantitative methods (Walker 2019). This requires sufficient resources to ensure the commissioning of a team with the requisite qualifications.

Even with adequate resources, HRIAs, particularly in the policy field, can be challenging to identify the human rights impacts. Human rights impacts from policies can often be indirect. When assessing the possible impact of a trade agreement, the first level impacts will often be economic which could have flow-on implications depending on whether a range of other factors (solid institutions, strong civil society, human rights legislation in place, and so on) is available to mitigate impact (Buerger Bonanomi 2017). Consequently, reliable statements of human rights impact might be challenging given the number of variables to take into account. In turn, policy-makers could explain away possible human rights impacts as the impacts might be difficult to trade to the policy (Walker 2019).

A further challenge is the use of participatory approaches to data collection and analysis. HRIA methodologies emphasize participation as a fundamental principle that should underlie assessments. Yet approaches differ significantly from consultations with key actors and the use of expert judgment, to undertaking public and online consultations and workshops while others have engaged communities, undertaken household surveys and semi-structured interviews with community members (Walker 2019). While differing methodologies between HRIAs might not be a problem in itself, there is some indication that the level of participation is related to the entity undertaking the assessment, with civil society organizations engaging more closely with communities and inter-governmental organizations engaging in higher-level public consultation processes. Further, the integration of the results of participatory processes is sometimes not rigorous with little explanation of how qualitative analysis gained through participatory processes is reconciled with quantitative analysis (Walker 2018). More work is needed to identify frameworks to guide and assess participation in HRIAs.

A further challenge is whether HRIAs do have an impact on the policies, programs, projects, or

activities that have sought to examine (Walker 2019). There is a risk that assessments requirement by government agencies or businesses might simply become a bureaucratic step in the process of agreeing a policy, program, project, or activity. Alternatively, sincere efforts by a civil society organization might result in a credible HRIA but policy-makers or business enterprises might not be open to discussing the results due to several reasons such as a lack of ownership of the assessment or engagement in the process or a lack of prioritization of the issues raised in the assessment. In this regard, more study is needed to examine the extent to which HRIAs have influenced changes in policies, programs, projects, or activities.

## Introduction

The UN Guiding Principles for Business and Human Rights (hereinafter, UNGP) (UN 2011), aka the Ruggie's Framework, has become the dominant framework to understand the ethical obligations of business. Even though the principles provide some guidance, there is still a number of challenges that companies face when they set out to instantiate their human rights obligations, including, but not limited to, what specific rights apply to their operations, how to establish priorities among them, and how to instantiate their claims – which sometimes can be very general.

The capability approach (hereinafter, CA) has already gone a long way toward supporting the theory and practice of human rights in a way that can aid in answering these questions. The field of development economics has seen the most progress in this regard, up to the point that the UN Independent Expert on the Right to Development (1998–2004) set out a development framework based on human rights, which objectives should be achieved through the expansion of capabilities. Nussbaum and Sen, the leading figures in the CA, view also human rights as entitlements to capabilities. Nussbaum, in particular, argues that capabilities can conceptually accommodate in an effective way the key normative dimension of human rights, i.e., dignity.

Furthermore, much scholarship is being carried out on the relationship of CA and corporate responsibility and business ethics. Thus, some corporate responsibility and business ethics scholars are developing the idea that human rights responsibilities of business – as gathered in the UNGP – must be ultimately discharged in the way of securing capabilities.

## Capability Approach and Human Rights-Based Corporate Responsibility

### Summary of the Capability Approach

The notion of human capabilities was first introduced by Amartya Sen, who developed his framework largely in the 1980s and 1990s in the context of his work on development and welfare

economics. Equally credited with developing it is Martha Nussbaum.

CA suggests that well-being and development should be conceptualized in terms of people's capabilities to function or to have functionings. Capabilities are different from functionings, in the way that potentiality and actuality differ. Functionings are effective opportunities for people to pursue actions and activities in line with their own conception of a good life. By "effective opportunities," it is meant a person's specific achievements. Examples of functionings may range from simple states like "being well nourished or avoiding preventable morbidity" to more complex ones, such as "appearing in public without shame or achieving political efficacy" (Sen 1985). What is relevant for individuals is not having equal access to whatever goods may be available in a society but whatever he or she is able to do or to be with the goods they come to possess.

According to Sen, in order to understand the ability to do or to be something, two aspects of freedom must be considered: opportunity freedom and process freedom. Opportunity freedom has to do with "whether the person is free to achieve one outcome or another" (Sen 1985), in the sense that there are options available for her to choose from, i.e., it refers to the size and scope of the set of individual and collective options. Process freedom, for its part, is about "whether the person is himself exercising control over the process of choice" (Sen 1985), i.e., freedom from coercion.

A further key qualification for effective functioning is its being underpinned by reflection, which is another way of saying that people's choices are, as mentioned above, based on their own conception of the good life. In this sense, capabilities allow someone "to achieve those things she has reasons to value" (Sen 2002). This typically means for goals of action to be able to withstand rational scrutiny – the highest form of it being a process of open discussion in the public arena.

Ideally, for Nussbaum, this reflection process will procure a set of capabilities that are central for human life: life; bodily health; bodily integrity; senses, imagination, and thought; emotions; practical reason; affiliation; other species; play; and

control over one's environment. Basic as they are, albeit interrelated in many complex ways, there is no substituting for or slacking on them.

The last CA's basic element described by Sen is the notion of "conversion factors." They are necessary conditions that must be met for capabilities to convert into functionings, which Nussbaum refers to as "material and social aspects" of human life. According to Sen (2005), there are four types of conversion factors that both constrain and channel human life and activities. The first is physical environment, such as climatic circumstances, floods, etc. The second is social climate, such as political institutions, availability of healthcare, educational arrangements, prevalence or absence of crime and violence, community relations, etc. The third is relational perspectives, which include standards for community life, social norms, etc. Finally, the fourth is personal heterogeneities, such as disparate physical characteristics linked to age, gender, disability, proneness to illness, etc. Conversion factors may go beyond its instrumental role to become part of capabilities themselves, as when getting into good shape (part of personal heterogeneities) may play a role in keeping someone's life longer and more satisfactory.

### **Dignity as Normative Core of Human Rights**

The adoption of the Universal Declaration of Human Rights (UDHR) in 1948 was the international community's first successful attempt to identify a set of human rights that are universal. "Yes, we agree about the rights, but on condition no one asks us why" (Glendon 1998). The lack of agreement on the theoretical foundations of rights agreed upon was not viewed as a substantial obstacle for moving forward with the project. However, those involved could foresee future difficulties that this might have in arriving at a common understanding of the meanings of rights, in reconciling tensions among the various rights, and in integrating new rights. To mitigate possible future tensions, the drafters had to think of a "key" that would help to create harmony between rights. This key was the principle of "human dignity" (Glendon 1998).

Carozza (2011) notes that the idea of human dignity has emerged as "the single most widely recognized and invoked basis for grounding the idea of human rights generally" and that it is used "as an exceptionally widespread tool in judicial discourse concerning the content and scope of specific rights." Dignity is protected by an array of legal prohibitions that suggest four categories of substantive areas (Carozza 2011): (1) prohibition of inhuman treatment, humiliation, or degradation; (2) individual choice and conditions for self-fulfillment, autonomy, and self-realization; (3) protection of group identity and culture; and (4) creation of necessary conditions for individuals to have essential needs satisfied. However, as will be seen below, the notion of dignity is not free from conceptual and practical challenges itself.

### **Human Rights as Entitlements to Capabilities**

Capabilities encompass what must be protected in human life, i.e., dignity. Based on Nussbaum ideas about dignity, two tiers can be distinguished in it: "status dignity" and "achievement dignity" (Formosa and Mackenzie 2014). The latter refers to the aforementioned basic set of potentialities "that already have dignity in the sense that they are already worthy of respect and care" in unconditional fashion; the former points to "a more advanced set of developed human abilities that make a person's life and action worthy of full human respect" (Nussbaum 2013) and can be subject to change. While the absence of basic capabilities can indicate the absence of human life, the presence of basic capabilities without a minimum level of functionings hints at a life that is too impoverished to make the claim of dignified.

Any human right can be seen as securing for someone the possibility to function in the area covered by that right. Human rights cover both the spheres of opportunity freedom and aspect freedom. Opportunity freedom refers to the substantive and positive freedoms that are the content of many rights, such as the right to a living wage or the right to privacy. The process aspect is related to instrumental and negative dimensions of freedom, such as autonomy and non-

interference by others, as contained in such rights as the right to a fair trial.

### How CA Addresses Challenges to Dignity

Dignity is the normative core of human rights but is met with several challenges to produce actionable conclusions. While controversies rarely arise in relation to the hard-minimum core of dignity, they are frequent where the requirements of human dignity are more contested. As a result, the concept of dignity was not very helpful in interpreting abstract human rights of evaluative nature, leading international human rights bodies to adopt a series of purely descriptive subsidiary rules to guide States on how to meet their international obligations. Lack of discussion, or even identification of the moral principles embodied in abstract human rights norms and their substitution with highly descriptive subsidiary rules, simply opens the door to the emergence of incoherent case law and, at worst, allows arbitrary use of the abstract language and its political manipulation. For instance, the prohibitions collectively referred to as CIDT (cruel, inhuman, or degrading treatment) – which are particularly relevant, for instance, in the context of manufacturing operations – lack any definition in international law, even though they constitute one of its central tenets.

Second, this “checklist” view favors fragmentation, in which specific rights can be targeted while making abstraction of the individual person and their link to her community. Human rights should enshrine the intrinsic value of the human person as a whole that is contained in the notion of dignity. However, dignity’s lack of foundation obscures the connection to the person as a whole and, therefore, rights’ ultimate meaning as well as the interrelations between them – which may result in conflicts and overlapping between rights’ demands.

CA can provide that much needed foundation. In respect to the first challenge – vagueness – basic capabilities beef up dignity with rich content about what it means to have a dignified life. As a set of evaluative standards, they serve as a basis for the thoughtful reflection that is necessary to avoid the potential incoherence of descriptive

lists. Furthermore, CA provides practical guidance to flesh out those normative requirements, as has been proven by CA’s contribution to cross-disciplinary theoretical integration and development in many fields and across cultures – including global poverty and human rights, inequality, living standards and development, gender and feminism, disability, education, etc. As was discussed above, the relevant notion in this regard is “conversion factors,” which offer a variety of specification levels ranging from the physical world down to personal idiosyncrasies.

In respect to the second challenge – fragmentation – CA provides a holistic and universal view of the person through its focus on empowerment, which is presumably shared by all human beings, regardless of sex, race, or cultural background. This is greatly helpful in harmonizing human rights’ demands amidst the tensions arisen in the intersection of their urgency and the feasibility of their realization. Alkire (2010) aptly highlights this contribution: “[t]he empirical analysis that is naturally undertaken by human development analysts can help to specify the most effective sequence of policies, the causal connections between different human rights and the instrumental value that one capability has in advancing other capabilities.” CA contributes to these goals in three ways. First, basic capabilities form a hierarchy that naturally gives priority to the rights that are more closely related to those basic capabilities in a certain moment. Second, in case of overlap between rights, it also helps to avoid confusion by drawing attention to the ultimate goal of human rights: to empower people and collectives to lead a life which value can be rationally justified. Third, Sen (2005) and Nussbaum (2000) have separately addressed the issue of how to rank capabilities according to their importance and urgency and identified four aspects of the reasoning process that can help with that determination of “sequences,” “causal connections,” and “instrumental values.” The four aspects are evolution of capabilities and needs, evolving understanding, target-dependency, and timing.

The two first aspects refer to the fact that social priorities may vary over time and, in the same fashion, human rights priorities may too. For

instance, the capability to learn can mean now something very different from 100 years ago, given the new disciplines brought about by technological advances. Consequently, nowadays, to ensure the right to education may imply to secure access to a tablet or smartphone. Furthermore, the understanding of equality had, for the most part of history in many places, included only free male people; today, that very same statement would be considered discriminating.

The third aspect (target dependency) is related to the prioritization of specific capabilities – and, therefore, specific human rights – based on the relative importance of one goal at a particular point in time. For instance, in a period of transition to democracy in a country, the rights to justice and reparation can be given priority over others. The fourth aspect (timing) is about prioritizing actions based on circumstances such as an audience's receptivity, availability of resources, etc. This is particularly relevant for corporate actions, where typically human rights actions must consider different stakeholders' competing interests and budget constraints, opportunity costs, etc.

### Capabilities as Framework for Human Rights Responsibilities of Business

In the last years, corporate responsibility and business ethics scholars have utilized CA to understand and specify corporate ethical obligations. Their contributions cover three main areas. First, “foundational” accounts seek to cast light upon the anthropological underpinnings of economics and business from a capabilities-inspired perspective. Second, contributions meant to develop business ethics theory. Third, works focused on the applicability of the CA to specific issues, such as employee motivation, gender equality, labor rights, etc.

As discussed above, CA supports a principled, holistic, and universal view of dignity and human rights. This makes CA well-suited to act as a framework for human rights-based corporate responsibility for the same reasons that were discussed in respect to the challenges to dignity. According to the UNGP (UN 2011), corporate activities leave no right unaffected and need a holistic and universal understanding of their

obligations. Furthermore, CA supports UNGP's recommendation to engage in a reasoning exercise that avoids a “checklist” approach. Finally, the CA features enormous flexibility of analysis that can apply to virtually any issue at any point in time to determine priorities and aspects of specification by drawing on the four factors of conversion – physical environment, social climate, relational perspectives, and personal idiosyncrasies – and the four aspects of the reasoning process: evolution of capabilities and their understanding, target-dependency, and timing.

## Humanistic Management

Michael Pirson  
Fordham University, New York City, NY, USA

### Synonyms

Human-centered management; Leading with dignity

### Description

Humanistic management is a notion used for organizing practices *that protect dignity and promote well-being* and human flourishing within the planetary boundaries (Mele 2003, 2009; Dierksmeier 2015). The cornerstones of dignity, well-being, and flourishing differentiate humanistic management from traditional economic management in which all that matters is related to having a price. In humanistic perspectives, there are many things in life that are intrinsically valuable, including human beings – who possess dignity – and, on a different level, other living beings. The ultimate purpose of humanistic management is to create sustainable flourishing on Earth rather than short-term wealth.

Within humanistic management, different philosophical traditions can be included. Thus, this term is used as an umbrella to point to the fact that wealth creation, productivity, and material gain is not the ultimate goal of human organizing.

## Ontological Foundations

Humanistic management builds on scientifically grounded, philosophically reflected, and culturally robust ontological foundations (Pirson 2017). The dominant, economic theories of management, in contrast, build on a theory of human nature that is assumption based. Agency theory, for example, assumes human beings to be rational utility maximizers without morals (Mele and Canton 2014). Ample research is making the claim that these assumptions are misleading because they are only partially accurate (Ghoshal 2005).

The humanistic management perspective which sees human beings as service-oriented stewards is often criticized for being naïve and unscientific. However, research in evolutionary biology, neuroscience, and psychology has since added insights about human nature and the survival of *homo sapiens* which allow the humanistic perspective to meet the challenge of being both more scientifically accurate and more relevant to managerial practice (Pirson 2017).

The humanistic management literature posits four evolutionary drives that need to be balanced to allow people to survive, experience dignity, and thrive (Pirson and Lawrence 2010; Lawrence and Pirson 2015). These drives are the drive to acquire (dA) things we need like food and the drive to defend (dD) the things we acquire. In addition, our species is said to have survived because of two independent additional drives: the drive to bond (dB) as an evolutionary stepping stone to *Homo erectus* and the drive to comprehend (dC) as evolutionary stepping stone toward becoming *homo sapiens*. Various empirical insights confirm that human beings flourish and are most productive when they have what they need in terms of money (dA), friendships and community (dB), purpose and direction (dC), as well as emotional and physical safety (dD). Organizing practices in this perspective are geared to balancing the four drives and not maximizing either one.

This evolutionary perspective coincides with much of the ancient wisdom shared by the global cultural and religious traditions (Kueng 1998, 2004). Scholars suggest that all global religious and spiritual traditions share the notion that

human dignity needs to be protected. Accordingly, the golden rule serves as baseline for moral stewardship and is advocated by most ancient wisdom traditions as key to the good life (Dierksmeier 2015, 2016). In the humanistic management perspective, good managers achieve a balance of the four drives for themselves as well as others.

This fundamentally different perspective on human nature results in two cornerstones for humanistic management. The first cornerstone is represented by the notion of dignity and the emanating dignity threshold. The second cornerstone is represented by the notion of the common good as the ultimate organizing goal of humanistic management.

### **Dignity as a Pillar of Humanistic Management**

Ultimately, in the context of humanistic management, dignity represents a category of everything that has an inherent value and cannot therefore be part of an exchange logic, that is, categories that are intrinsically valuable, like human dignity, the dignity of character, or the dignity of aesthetics. Importantly, applying this “categorical” dignity to human relationships is the crucial difference between humanistic and economic perspectives on organizing (Pirson et al. 2016). It is important to note that dignity typically is connected to human dignity. As such it has been the reference point for any conversation on human rights and has informed global governance conversations on the political level especially throughout the latter part of the twentieth century. Dignity is increasingly applied to life in general including the intrinsic value of the environment.

### **The Common Good as the Ultimate Organizing Purpose**

In the humanistic conception of management and organizing, the central aspiration is a contribution to the common good, being understood as human flourishing (Aristotle) or a well-being

(utilitarianism). This aspiration is not new but has been marginalized in the past 200 years as far as the economic context is concerned (Dierksmeier and Pirson 2009; Pirson 2017). An increasing number of positive psychologists take it as a given that human beings wish to be well and flourish. While the goal of the common good, often understood as well-being, may be uncontested for individuals, as well as governments of nation states, the humanistic management perspective suggests it can be equally relevant at the organizational level (Pirson 2017).

### **Implications for Research, Practice, Pedagogy, and Policy**

The humanistic perspective of management has far ramifications for organizational research, management practice, pedagogy, and public policy (Pirson 2017).

In terms of research, the humanistic perspective changes the overarching research questions: rather than exploring the outcomes of wealth, economic performance, or shareholder value, the dependent variable is the organization’s contribution to stakeholder well-being. Another question derives from the notion of dignity. Rather than exploring how human resources can contribute to economic performance, the core question becomes how dignity can be protected or promoted throughout the organizing process.

In terms of management practice, this shift is quite radical. While many organizations and managers are centrally concerned with the protection and promotion of stakeholder dignity, especially in the context of social enterprises, most traditional businesses lapse into viewing human beings as mere resources (i.e., human resources). Similarly, many businesses are not measured by their contribution to the common good but by profitability (Kamakowicz et al. 2010). This has been changing in the recent decades, and many enlightened business leaders claim to pursue more conscious business practices that advance a higher purpose. The rise of social enterprises, the increasing popularity of shared value creation, and the heightened visibility of conscious capitalism are cases in point.

Humanistic ideas are gaining increasing relevance in business schools, and many business schools are embedding social innovation pedagogy in their curriculum (Amann et al. 2011). While this is mostly happening in an add-on fashion to complement the traditional curriculum, some universities are regaining societal legitimacy by educating students as positive changemakers.

In terms of public policy, the humanistic perspective informs practices that protect human dignity and promote common good or well-being, such as reporting standards that explore contributions to the common good. These reporting practices can lead to tax incentives that reward those with high common good contributions and increase taxation on those organizations that hurt the common good. Other policy ideas could be the creation of alternative corporate governance standards or social stock exchanges that allow social enterprises to access more funding to scale up their practices.

## Conclusion

The humanistic management perspective suggests that researchers, practitioners, teachers, and policy makers need to refocus on perspectives and practices that honor all the things that make life worthwhile and serve the common good. Humanistic management embraces dignity as a notion that represents all the things that have intrinsic value in addition to those elements that have a price. It also espouses the aspiration to organize for higher levels of well-being which includes wealth.

### Synonyms

Values-based marketing

### Introduction

Could marketing practices and processes, while staying true to marketing's stated goals and desired outcomes, center human individuals and thereby improve human life? Could some distinctive aspect of marketing respond to human desires and human potential and increase opportunities for bettering society and human existence around the globe? These are basic assumptions, perhaps aspirations, of humanistic marketing.

Some might argue that this is indeed marketing's promise and that marketing research and marketing departments aim for this already, attempting to meet deep-seated human needs and wants. Proponents of humanistic marketing have articulated the hope of moving away from ideologies of growth at all costs to champion a human-centered set of values, goals, and futures. To this end, the potential of humanistic marketing is to form a vision for marketing practice and processes, in addition to marketing research, which attends to human being, human dignity, and human flourishing beyond profit-

making protocols and business benefits so often isolated from larger, but also everyday, human concerns.

However, given longstanding appeals for shareholder benefit and profit-making above all else, it is unclear whether the well-being of anything other than the market can be prioritized in marketing practices and processes. Unless one believes that, at all moments in time, the well-being of the market is identical to the well-being of humanity, marketing's founding assumptions and the related requirements for producing, and reproducing, the conditions for the market appear unlikely to provide the foundations for humanistic marketing.

A key challenge is to bring business and human welfare into balance and perceive human value creation and human recognition of self and others outside a narrow understanding of humans as consumers (Firat and Dholakia 1998). Consider that "marketing," according to the American Marketing Association, involves institutions, processes, and exchanges, but no mention of human beings through which these are in part constituted, materialized, and valued. Moreover, research on the absence of "people" in marketing emphasizes the difficulty of transforming a marketing perspective and a "consumer" orientation into a human-focused endeavor (Wooliscroft 2014). From the consumer as "citizen" to the commodification of childhood, a consumerist reductionism, militates against reactivating alternative, which is nonconsumer, human roles.

### The Human in Humanistic Marketing

A *humanistic* version of marketing begins with a sense of what it means to be "human." A notably human trait, or a distinctive human means of engagement, lays a foundation for humanistic marketing. Given that a number of competing visions of what it means to be human, to live as human, and to engage with others as human, exist, from the beginning, humanistic marketing enters territory fraught with every day but also powerfully ideological disagreements.

### Reason, Autonomy, and Intersubjectivity

It has been argued that humanistic marketing is “guided by reason in caring about others as well as the self” (Varey and Pirson 2014, p. 6). As articulated here, then, humanistic marketing builds upon notions of self and the apparently unique human capacity for reasoning. While this is an obvious choice, it is not a simply “natural” one. Making reason the key to defining the human has been shown to deemphasize many other crucial, if related, human qualities, for example, emotional intelligence and empathy. Insofar as humanistic marketing promotes centering the human, and especially the reasoning autonomous self, questions arise regarding the place of the human individual within a community of human others.

A number of criticisms have been leveled against perspectives that take “reason” as the basis of human ethical action and inclination. This may sound odd; but many have pointed out the ways in which human reason, often concatenated with notions of objectivity, demonstrates short-sightedness, self-interest, and an inescapable subjective bias. Alternative ethical systems, for example, emerge from philosophers, such as Emmanuel Levinas (1985), who have based ethical action in response to others who, at least potentially, share the world with us. In other words, ethical considerations and response are founded not upon reason and decision-making but upon the very notion of others being part of who we are and here in the world with us. Not surprisingly, then, a Levinasian ethical response that addresses the ways in which individual identity begins with engagement with others in the world represents precisely the kind of intersubjective conceptualizing that many humanistic marketing proponents want to avoid, claiming loyalty, instead, to notions of individual autonomy. One thinks as well of work in care ethics, wherein philosophical interpretations of Kantian duty have declared ethical reflections based on care, and the resulting actions, amoral, as care ethics is said to fail to refer to rational principles that emphasize individual decision-making and therefore individual autonomy (Borgerson 2017). In contrast, one might say an ethical act of caring cannot “wait” for decision-making.

The refusals and tensions around the human that manifest in humanistic marketing have deep philosophical roots. Still, conflicting aspects of intersubjectivity, caring, and autonomy-based ethics need not suggest an unresolvable conflict that derails demands for centering greater human flourishing in marketing and business practices and processes more generally. However, as researchers reflect on a future in which marketing educators, practitioners, and researchers make as their cause the building of a more just world and act to create this world, they may be compelled to recognize a variety of human responses other than reason in the activities that resonate with the actions and attitudes necessary for attending to human well-being. Those who have begun to animate the potential of humanistic marketing demonstrate awareness of these complications.

### Founding a Functioning Field

*Humanistic Marketing* (2014), a book published as part of the Humanism in Business project, suggests the intentions, and biases, of those hoping to create the field and thus the potential trajectories of humanistic marketing. In promoting a form of marketing that does focus upon human well-being and human dignity, the project of creating humanistic marketing through innovative research programs could contribute to “a human-centered transformation of the socio-economic system” (Varey and Pirson 2014, p. 6).

The project of Humanism in Business promotes critical reflection upon the “exchange paradigm,” overconsumption, and unhindered profit seeking and moreover the failure to focus upon human flourishing.

### Ideological Tensions

Beyond taking the human individual as its starting point, humanistic philosophy “emphasizes the human capacity for reasoning. It is therefore equally hostile to any form of collectivism, including socialism and communism” (Varey and Pirson 2014, p. 3). Here is an announcement of antipathy toward certain concepts and theory, loyalty toward others, and a puzzling assumption

that socialism stands against a “human capacity for reasoning.” The eschewal of “socialism” implicitly addresses the potential blurring of theoretical boundaries and sympathies when approaching ethical issues of market capitalism.

Clearly, there is some anxiety about the humanistic marketing project in a culture of business school leaders who tout such wisdom as “our only loyalty is to the share holders” and deem ethical inquiry of marketing and business practices anti-business, perhaps, Marxist but, most certainly, irrelevant. Humanistic marketing’s concerns do overlap with perspectives taken by critical management scholars who have raised questions around the failings of various economic arrangements (e.g., Alvesson et al. 2009). However, critical management study scholars often, but not always, draw upon traditions of post-Hegelian thought, or, for instance, labor process theory, in pursuing these concerns.

To put this another way, humanistic marketing, as imagined and worked on by the Humanism in Business project, must operate from the ideological and conceptual limitations built into its very origins. Clearly, some humanistic marketing proponents will accept no answer to the question “What is the human?” which contests notions of autonomous reason or suggests an affinity for conceptual aspects of the so-called socialism, perhaps perceived in versions of intersubjectivity. In sum, battle lines are drawn around understandings of the relationships between the individual and society as these are typically constructed in an ideology of capitalism versus socialism. To be sure, this will constrain the kinds of innovations – toward attending more fully to the human at the center of marketing inquiry – that might be asked for, as well as determine, boundaries that must be adhered to in imagining a future for humanistic marketing.

### **Human Dignity, Human Purpose, and Dehumanizing Marketing Practices**

A main tenet of humanistic marketing posits a vision and implementation of marketing that supports core human qualities, for example, dignity, where dignity relates to a “human capacity to define autonomously the purpose of its existence.” Along these lines, social cooperation rests upon reasoning and negotiation and a keen

sensitivity to inequalities of power and position, as well as terms of agreements. Community emerges through chosen engagements of autonomous individuals, in contrast to understandings based on intersubjective identity.

Cultures guided by belief systems that accept the purpose of human existence to be defined by some form of higher power will likely see a weakness in humanistic marketing. However, the emphasis on “human capacity” addresses the free will to choose, on one’s own, the purpose the higher power has defined and made available. In sum, a humanistic marketing ethic, regardless of the emphasis on human choice, is not in necessary contradiction with God’s will.

Based on the definition of dignity, dehumanizing marketing practices and processes might include marketing communications, and other forms of representation, that disrupt a particular group’s potential future opportunities or possibilities and thus the represented group’s capacity to define their own purpose. Researchers have noted that dehumanizing marketing practices are likely to arise when market conditions become more competitive.

If competitive marketing conditions are seen as a basic, even necessary, part of economic growth, then apparently such conditions, and related practices, are unavoidable and indeed an everyday part of growth and a competitive market (Stoeckl and Luedicke 2014). In sum, ethical interrogation and intervention would be a continuous, and arguably mostly ineffectual, effort on the part of humanistic marketing. In this sense, humanistic marketing fails to address the kind of “critical” scholar who sees the only hope of a better, more dignified, future for humankind in the tempering, or in the end, of market capitalism.

### **Human Responsive Marketing or the Commodification of Human Experience?**

Some researchers have suggested that a more humanistic marketing project requires bringing human practices into marketing, including aspects of emotional experience, self-extension, community participation, and consumption as meaning (Gopaldas 2014). Others argue for using

marketing practices and processes to bring awareness to topics and issues related to human well-being and aspects of global justice (Yu et al. 2014). Perhaps, there is a core aspect of marketing that might offer qualities for a more human-responsive market.

### The Social Power of Marketing

It has been suggested that human centeredness might be accomplished through “the social power of marketing,” in contrast to a process of “integrating morality (in the form of social responsibility and sustainability) into marketing” (Varey and Pirson 2014, p. 6). From this perspective, concepts of social responsibility often entail prescribed modes of interaction motivated by broader notions of what people owe to each other or what attention to shared life-worlds demands. Notions of sustainability might employ a vision of maintaining certain standards of benefit or protection in the face of development, industrialization, or resource exploitation. Such prescribed modes and standards for sustainability may be perceived to import *shoulds* that reach beyond what the machinations of so-called marketing systems or marketing innovation themselves enable around the humanistic center. Not surprisingly, eschewing the “integration” of social responsibility or sustainability into marketing resonates with the familiar, highly criticized, if not undemonstrated, claim that the market unhindered will allow and enable the “right” aspects of human life and the human community.

Moreover, turning to the “social power of marketing” will require a sense of what makes for “the betterment of society.” Understanding “betterment” itself will require an analysis within marketing of that from which the values of sustainability or “protecting human dignity” emerge, implicating, if not a broader “moral” perspective than at least, an ethical one. Researcher Fuat Firat argues that as marketing is necessarily an agent of economic growth, only if economic growth is also the core of humanistic values can marketing become humanistic. If marketing can be defined as “the institutionalized practices of the modern institution we know as ‘the market’,” then the essence of marketing is linked to the market,

meaning that either the market must become humanistic or the associated institutionalized practices, which is marketing, must “humanize” the market (Firat 2014, p. 126).

### Human-Driven Demand and Push Versus Pull

Those who turn to the power of marketing to deliver a better world often express hope in human-driven demand. Consider the possibility that “if one were to tap into underlying human desires for connectedness and dare we say, love, then it becomes possible to appeal to a mind space of human-driven demand for service and goods rather than market-driven supply” (Vos and Varey 2014, p. 251). However, in turning to basic concepts related to principles and practices of marketing, a technology developed, for example, to stoke demand for a new innovation or meet requirements for gaining the attention of people going about their daily routine.

There is a common distinction in marketing strategies between pushing product out the door onto consumers, marketing what you need to sell – what has been supplied and needs to be gotten rid of – and marketing scenarios where consumers are pulled in by a desire to seek out, and demand, what they want. In other words, one might take to heart that marketing holds an important skill set that includes connecting people – as well as connecting people with the things they want and need– connecting ideas, and thus promoting happiness and adding value for the firm. However, even with a pull strategy that purports to meet consumer demand and make available what the consumer calls for, marketing wisdom demands the creation of awareness of products and services and the steering of consumers toward certain of these.

“Human-driven demand” versus “market-driven supply” marks a contrast, but most of what can be recognized as “marketing” interprets “human-driven demand” as an opportunity to research eye movement and other neurophysiological indicators of attraction to increase the likelihood of product appeal and purchase. Human desires that are unhealthy or damaging to overall physical, mental, and even environmental well-being are often those desires to which marketing

research and practices most hope to appeal. Addictive desires are powerful, and marketing practices and processes reveal the temptation to draw upon these to achieve “loyalty,” hence continued purchasing and thereby profit. Whether a human demand is made explicit and marketing responds or, with selling always in sight, marketing aims to discover, or remind people of, what they could demand remains a tangled question.

### Limits of Humanism: Essentialism Versus Lived Reality

As typically understood, humanism places the human at the center of concern, looks to human choice in the creation of value, and potentially places emphasis on a shared human condition. When a notion of the human is at the core of an undertaking, such as humanistic marketing, the dangers of essentialism, or a narrowness of definition that excludes swathes of those that do not meet the definition, raise crucial concerns. Further, with notions of human needs and human wants at the core of humanistic marketing, distinguishing needs from wants poses a key tension (Dirksmeier 2014).

Certain philosophical approaches and commitments may bring into question the substance-based metaphysics emerging particularly from Aristotle that serves as a foundation for an essentialist notion of the human, or human nature, which then might be expected to ground essentialist notions of “needs” and “wants.” Philosopher Lewis Gordon points out that “a good reason to be anti-essentialist is that essentialism goes against the grain of reality” (Gordon 2012). In other words, researchers may bring a conception of lived reality – and the contexts reality grants us for understanding various needs and wants – to bear upon our perceptions and understandings but at the same time continually undermine essentialist closures around what human being *is*. In another instance, philosopher John Dupré has argued for a processual understanding of the human, wherein rather than “being” understood in a traditional substantial, even static, sense, or as a thing, living beings are

a kind of process (Dupré and Nicholson 2018). Such notions open up alternative ways to understand humanity, human wants and needs, and, thus, what a humanistic marketing could be.

Forms of humanistic marketing that are wedded to notions of individual autonomy and reason risk a limited understanding of humanity and, further, the ways by which humans become what they are in their relationships to themselves and human others, as well as to other sentient beings and the wider environment. Crucially, loyalties to a hierarchically dualistic contrast between capitalism and socialism may continue to undermine possibilities. Whether marketing practices can detach from origins in technologies of competitive and growth-dependent profit-making and escape processes of commodification to champion human connection and dignity toward a more just human reality remains an open question core to humanistic marketing’s future work.

After a series of humanitarian failures, humanitarian organizations came together in the 1990s to forge a number of agreements designed to strengthen the sector and improve its capacity to meet extreme human need. Forming a humanitarian canon, the core points of agreement are:

- The *Code of Conduct for the International Red Cross and Red Crescent Movement and NGOs in Disaster Relief*, also developed collaboratively and agreed in 1994
- The Humanitarian Charter, developed through an extensive collaborative process in the late 1990s and published in the *Sphere Handbook* (2000, 2004, 2011)
- The Protection Principles, developed alongside the Humanitarian Charter, also in the *Sphere Handbook*
- The humanitarian principles, enshrined in the UN General Assembly Resolutions 46/182 (1991) and 58/114 (2004)

These documents communicate a strong core ethic and, together with the international humanitarian law, form the foundation of ethical thinking in humanitarianism, which has a long history, from Jean Pictet (1960, 1975) in the early twentieth century to Hugo Slim (2007, 2015) today.

Humanitarian action is distinct from development or foreign aid in that it responds to extreme human need, with the aim of saving lives, reducing suffering, and promoting dignity. Development, in contrast, is focused on maximizing opportunities and resources for those most marginalized and impoverished. While there are many similarities between the two (and periods of transition in which both labels are applicable), they are grounded in distinct ethical approaches.

## Humanitarian Ethics

Vandra Harris  
Global Studies, RMIT University, Melbourne,  
VIC, Australia

## Synonyms

Human needs; Human rights; Humanitarian aid; Humanitarian principles

## Introduction

The field of humanitarian practice is clearly delineated and much more restrictive than the broad sense of helping found in dictionary definitions of humanitarianism. This distinction rests largely on the shared ethical principles that underpin professional practice.

## Description

Humanitarian practice and ethics are solidly founded on four “humanitarian principles”: humanity, neutrality, impartiality, and independence. The principle of humanity is that every person is entitled to assistance. This is grounded in Article 1 of the *Universal Declaration of*

*Human Rights*, which states that “all people are born free and equal in dignity and rights” (UN 1948). Humanity forms the core of humanitarian ethics and practice, with a clear focus on the worth, dignity, and basic human rights of all people affected by conflict. It leads to the concept of the humanitarian imperative that nothing overrides the fundamental requirement to prevent and respond to human suffering resulting from conflict and disaster.

Neutrality is the commitment not to take sides in a conflict or in “controversies,” and this stance enables humanitarians to make nonpartisan calls for assistance and restraint. Impartiality specifies that humanitarian assistance is offered to all people affected by crises, with priority being given according to need alone, unaffected by factors such as participation in the conflict, political beliefs, gender, sexuality, ethnicity, or religion. Finally, independence is the undertaking that humanitarian objectives and action remain independent of political, economic, military, and other motives. One function of this principle is to enable humanitarians to reject funding conditions seen as promoting political or other non-humanitarian goals.

As such, humanity and impartiality guide actions around who is to be assisted (all people affected by a crisis, according to need), while neutrality and independence relate to actions related to politicization of humanitarianism with respect to local conflicts or external objectives. In expressing the virtues of humanity and impartiality, these principles enable practitioners to make moral claims on others and to make decisions regarding focus and action in situations of extreme need and high pressure. Similarly, through the virtues of neutrality and independence, the principles can confer (limited) protection and security and facilitate access to those in greatest need.

The voluntary code of conduct adds six principles to the above four core humanitarian principles, namely:

- Respect for culture and custom
- Building on local capacities

- Participation of beneficiaries in aid management
- Reducing vulnerability
- Accountability
- Representation of affected persons as “dignified humans”

These additional principles are focused on the impact of humanitarian action and the way it is conducted. Aimed at maintaining “the high standards of independence, effectiveness, and impact,” the code is consistent with development ethics in that it promotes full humanity through concerns with dignity and power, both now and into the future.

Dignity is another central concept in humanitarian ethics. It is named in the Humanitarian Charter as one of the three core rights of all affected people: life with dignity, humanitarian assistance, and protection and security. The focus on dignity expresses the core value that mere survival is not enough; even in the face of disaster, trauma, or enduring displacement, people must be able to live with a sense of their innate human value. This is expressed in minimum standards of humanitarian response (see Sphere 2011), which seek to ensure adequate living arrangements; support for social, religious, and economic activities; and other factors that underpin people’s sense of self-worth.

As a whole, the humanitarian canon sets high ethical standards. However, in the messy reality of humanitarian action, there are always challenges to this ideal. These challenges may include the necessity to negotiate with warlords or other participants in violent conflict to gain access to affected communities, the reality that humanitarian assistance may be appropriated in support of conflict or may prolong a crisis by allowing governments and others to concentrate resources on conflict or enrichment, and extreme danger or physical barriers that prevent access to those in greatest need.

These and other challenges point to the importance of context in humanitarian ethics, in which idealism must be held in tension with pragmatism in order to ensure that lives are saved and can be continued with dignity. Humanitarian ethics are

thus aspirational, and this is precisely what enables humanitarians to continue their work in the face of funding levels that fall far short of mounting demand and which may appear more responsive to political motives and media attention than to real human needs.

## Summary

Humanitarian ethics is grounded in a set of guiding principles broadly accepted within the humanitarian community. They are aspirational but nonetheless central to how the profession views itself. This canon and the ethics embodied within it form a critical framework for action that saves lives in the most dire environments, according to greatest need, and with a central focus on human dignity. In addition to serving the needs of people in extreme need, these principles aim in part to protect humanitarian actors and action from violence and disruption, by setting them apart from politics and conflict.

## Humiliation and Dignity

Sheldene Simola  
School of Business, Trent University,  
Peterborough, Canada

## Synonyms

Abasement; Degradation; Ignominy; Indignity; Regard; Respect; Value; Worth; Worthiness

## Introduction

Although dignity has a positive connotation, it has often been understood and theorized through contraventions that have negative connotations. Such contraventions are indignities that comprise a range of actions or omissions that neglect, disregard, or violate the inherent worth of individuals or groups, or otherwise constrain or diminish their possibilities, opportunities or likelihood of fulfilling their human potential. Although the concept of indignity is often used interchangeably with the concept of humiliation, various scholars have identified that indignity is not necessarily synonymous with humiliation. For example, not all indignities involve humiliation (Bal 2017).

Humiliation has dual meanings. It refers to actions taken against another individual or group, which can be capricious or systemic in nature. It also refers to the deeply painful emotional experiences that others suffer in response to those actions (Hartling and Linder 2018).

Humiliation is an inherently relational (rather than intrapersonal) process involving the unjust use of power in ways that control the other. Ironically, perpetrators of humiliation might not consciously perceive their actions in negative ways, as acts of humiliation might reflect attempts to transform others from those who are deemed to be unacceptable for inclusion in their present form, into those who are deemed to be at least somewhat acceptable in their humiliated form (Klein 1991).

### Characteristics of Humiliation

As alluded, defining characteristics of humiliation include the forceful exercise of power over another that occurs with seeming impunity, in ways that devalue, degrade, and convey the abject and encompassing inadequacy of the other, and which result in ostracism of the other (Klein 1991; Hartling and Linder 2018; Kożusznik 2017; Smith 2001). Those who are humiliated are precluded from refuting the claims through which they were ostracized, and are often denied opportunities for reinstatement or recovery of their lost status within their reference group (Smith 2001). Humiliation typically involves one or more witnesses, who in the absence of objection and challenge to the humiliation of another authorize and sanction the humiliation of that other. Therefore, humiliation is a form of social control in relation to those who are targeted, as well as to observers (Czarniawska 2008; Kożusznik 2017). Because humiliation violates the identity, boundaries, and dignity of those upon whom it is inflicted, those who are humiliated often experience humiliation as a traumatic and moral violation and injury (Klein 1991). Sufferers also often perceive that socially accepted norms, values, conventions, or laws that typically guide human interaction will no longer be upheld in the interactions of others with them (Czarniawska 2008). This can lead to a sense of helplessness and demoralization, as well as further losses of agency and voice. Those who suffer humiliation often perceive no path through which to recover from the damage caused to their identity, boundaries, status, worthiness, or even

adequacy. Reclamation of their lost humanity might well require establishing association with a different reference group (Smith 2001). Those who feel humiliated often experience intense, negative emotional responses such as sadness, anxiety, and rage. If rage is turned outward, against the perpetrator, this can result in a retributive and escalating cycle of harm and even violence between two parties (Hartling and Linder 2018; Smith 2001).

### Humiliation Within Business and Organizations

Within business and organizations, humiliation might be enacted through various forms of discrimination, inequity, harassment, and abuse, as well as through unsafe workplace practices. Humiliation can also be enacted through disbelief or denial of observable employee mistreatment; failures to act in good faith with respect to workplace accommodations; and, actions that unjustly diminish the possibilities or opportunities of certain employees, such as marginalization or stigmatization of employees or work roles (see, e.g., Czarniawska 2008; Kożusznik 2017). It might also be enacted through the exploitation of employee needs or vulnerabilities, including those associated with precarious, part-time or no contract work (Smith 2001). Similarly, humiliation might occur through unattainable productivity requirements or situations in which employees are held responsible for things that they cannot control (Lucas et al. 2013). Unwarranted monitoring, surveillance, or restrictions of personal autonomy; requirements to deny, disparage, silence, or disavow the self; or requirements to endorse certain pro-department or pro-organizational thoughts or feelings are also potential examples of humiliation (Lucas et al. 2013). Businesses might also unjustly exercise power and domination over the vulnerable natural environment, through destructive practices in which other living beings or other natural entities are subject to degradation, mistreatment, exploitation, or violence (Bal 2017; Pirson 2019).

## Role of Business in Systemic Humiliation

Humiliation occurs at various levels in human systems. It is not limited to interpersonal or group levels. Rather, humiliation often inheres the broader sociopolitical and economic systems such as colonialism and capitalist globalization in which business operates (Bal 2017; Hartling and Linder 2018; Smith 2001). Within such systems, the enactment of exploitative and humiliating policies and practices has served as tools of oppression, control, and attainment of profitability goals. Historically, this has occurred through the forced and violent separation of Indigenous persons from their families, homes, languages, cultures, and governance systems; forced assimilation or enslavement; the “use” of humans as sources of inexpensive labor in order to reap very large profits; and the pillaging of natural environments and resources.

## Dignity in Business and Organizations

Historically, dignity has been a peripheral or contextual, rather than focal area of research within business ethics. Several factors have likely contributed to this. For example, and as alluded above, within a conventional economic framework, the focus on profit maximization often relegates employees to instrumental and dehumanizing roles and functions, through which they are used as means to achieve end goals. Such a focus also involves the commodification of products and services. In contrast, dignity is intrinsic to living beings, processes, and creations; and entities with intrinsic value cannot be commodified for efficient economic exchange (Pirson 2019; Pirson et al. 2016). Hence, dignity is inconsistent with the classical economic framework.

Additionally, conventionally, business and management have privileged individualist rather than relational orientations to practice and research. Individualist perspectives emphasize separation, self-sufficiency, and competitive achievement in the self-interested pursuit of material wealth and consumption, rather than interdependence, mutuality, and cooperation

aimed at value creation, and ultimately, wellness for broader groups of stakeholders. Within an individualist context, relational concepts such as dignity are easily obscured, omitted, or discounted (Hartling and Linder 2018).

Although legal regulations might offer some protection to the human rights and dignity of vulnerable employees or other stakeholders, dignity is not simply an issue of legal or human rights. Rather, dignity exists as a foundational ethical construct for both the protection and advancement of individual and collective rights, responsibilities, and well-being.

In the twenty-first century, dignity has become an increasingly focal area of research, particularly among scholars and practitioners of humanistic management (Pirson 2019). In contrast to economistic management that privileges profit maximization and shareholder wealth, humanistic management is a field aimed at fostering a good and well society. Within humanistic management, dignity serves as a rationale, a method, and a goal for overcoming dehumanizing and ecologically destructive business frameworks and management practices.

## Types of Dignity

Within business and management, three types of dignity have been discussed (Lucas 2015). The first type of dignity, called unearned or unconditional dignity, is considered universal. It derives primarily from a Kantian perspective in which individuals have inherent worth, and are seen as ends in and of themselves, rather than means to achieving ends (Pirson et al. 2016; Pirson 2019). The intrinsic value associated with unearned dignity implies the importance of personal autonomy or freedom of self-determination, and capacities to exercise that freedom in moral ways, that recognize and respect the inherent worth of self and others. Given that vulnerabilities are present for human and other living beings within ecological systems throughout life cycles, safeguarding of their inherent dignity is considered vital.

The second form of dignity derives primarily from an Aristotelian perspective. It is a form of

dignity that is conditional upon, or earned through, one's virtuous behavior (Pirson et al. 2016; Pirson 2019). It refers to the respect and value achieved through activities that expand one's capacity for, and ideally, fulfillment of, good or right actions. Earned dignity implies that that one has the capacity (conditions and opportunities) to take competent actions. The advancement of earned dignity is vital for enabling individuals to fulfill their human potential, including making a difference to others.

Through empirical research, Kristen Lucas (2015) identified a third type of workplace dignity, called remediated dignity. Remediated dignity refers to restrictions placed upon, or reparations made in relation to, indignities suffered by employees (or other stakeholders) by virtue of their subordinated positions or their treatment as instrumental means to achieve organizational goals. Remediated dignity occurs through organizational practices or interpersonal interactions that affirm the uniqueness or worth of employees outside of subordinated work roles, as well as through workplace demonstrations of care without expectation of reciprocal exchange and through words and actions aimed at inclusion within the workplace.

## Theory of Workplace Dignity

Matthijs Bal (2017) has begun the work of developing a theory of workplace dignity. Central to this theorizing is the Confucian notion that the workplace itself has inherent worth. In other words, workplace dignity is a form of organization that is not simply instrumental in nature; but rather, as a form of organization through which individuals can develop and enact capabilities that will enable them to contribute creatively and meaningfully to the wellness and sustainability of the human and natural communities and systems in which they are parts. Hence, this framework decenters humans and organizations by placing them as elements within larger webs of interconnection. Dignity therefore occurs in relational interaction and includes both rights and

responsibilities for individuals in terms of how they are treated and how they treat others.

Within this model, enhancements in workplace dignity and the broader social and ecological spheres develop through dialogue and self-reflection among stakeholders, rather than through the unilateral imposition of corporate policy (Bal 2017). Modes of enhancing dignity include self-directed individual efforts to abstain from violations of dignity; and, other-directed individual efforts to proactively respect and support the dignity of other living or inanimate entities. These also include informal and formal, individual and collective efforts to create values, norms and standards aimed at protecting the dignity of diverse stakeholders; and, the active cultivation of dignifying conditions and opportunities for diverse stakeholders, as well as the reparation of past harms (Bal 2017).

## Identity Politics and Ethics

Chris Provis  
UniSA Business, University of South Australia,  
Adelaide, SA, Australia

### Synonyms

Ingroup-outgroup conflict

### Introduction

The term “identity politics” seems to date back to the 1970s. The phenomenon itself could certainly be found at earlier times, but around then it became most clearly distinguished as a form of political dynamics. The term had a focus “on groups that are defined by a common experience of exclusion or oppression, thus on identities that are often secured in direct opposition to some ‘other’” (Phillips 1993, p. 17). These may be referred to as “identity groups.” Particular examples included African-Americans and women. Identity politics revolved around social and political movements based on such groups.

In the time since then, application of the term has expanded as a wider variety of groups have also used shared identity as a basis for political action. Opportunities to do so may have increased as a result of emerging technologies of electronic communication and social media. In recent years,

identity politics offers an explanation for widespread polarization of views on many topics and extremes of intolerance for different views.

Ethical issues of identity politics are tied to the way that shared identities can provide a basis for collective action. Typically, they do so because, as Phillips points out, the identity they share is made salient in contrast with the identity of some “other,” typically another group, and motivation for action is provided by belief that in some respects or others the other group is unfairly better off or has acted in ways that restrict or disadvantage the first. Such claims of unfairness, restriction, or disadvantage are inherently ethical claims, and therefore invite ethical scrutiny in themselves. In addition, the process by which collective action is motivated by group identification invites ethical scrutiny.

### Ethical Issue About the Claims

In regard to the claims of unfairness and disadvantage made by identity groups, the difficulty is that since the 1970s, many other groups have also come to see themselves as disadvantaged or restricted. In the USA by 2018, Chua notes not only blacks and women, but ethnic groups such as Latinos and Asians; religious groups including Muslims, Jews, and Christians; gay people; and many others all make such claims and use them as the basis for some form or other of collective action (Chua 2018, p. 9).

In addition, the fact that a group identifies itself in opposition to some other group automatically gives salience to the identity of that other group. The action taken by the first group in opposition to the other group can then equally be perceived by members of that other group as restriction or exploitation.

While it may well seem that some claims are clearly well-founded, and others poorly founded, nevertheless the overall effect is for extended, deep contestation about the merits of many claims, sometimes including extremes of violence. The situation is made more difficult by the inherent philosophical difficulties in judging some aspects of the claims that are made. These may include not only claims about the disadvantage and restriction suffered at present by individual members of the group, but also claims about disadvantage and restriction suffered by past members of the group, and claims about effects on the group that are not necessarily effects suffered by individual members so much as effects on the culture of the group (for discussion, see Appiah 2005).

One problem is assessment of counterfactual claims. This can be a basic part of the arguments, but can also be very difficult. For example, there may be claims about the extent to which individual members of a group at present can reasonably claim to be worse off than they would have been if in the past members of their group had been better treated by members of other groups. Another problem is that of relating effects on groups to effects on individuals. It may be that on average members of group A are worse off than members of group B, but that many individual members of group B are worse off than many members of group A (for example, on average black American are worse off than white Americans, but many white Americans are worse off than many black Americans). What action then may compensate members of group A without unfairly disadvantaging the worst-off members of group B?

Clearly, it is also a problem to what extent account should be taken of effects on groups as wholes, regardless of effects on individuals. In particular, for example, to what extent are adverse

effects on a group's culture or language effects that may count as adverse effects on individuals, or even deserve to be taken account of quite regardless of effects on individuals? It is here that issues of group identity can become especially pronounced: it is arguable that it is only insofar as a group has an identity separate to that of its individual members that it can merit consideration separate from that of its members.

All of these and related issues have been the subject of discussion; some, of very extensive discussion. Some have been the subject of court action in various jurisdictions. Some are more complex than others. For some, there seem to be clear answers. However, there are enough questions that are complex and difficult, and still theoretically contested, that they form the rationale for group conflict, especially when there are other bases for such conflict as well as the merits of such arguments. Often, the dynamics of such conflict emerge from other factors.

### **Ethical Issues About the Process**

Most especially, identity politics can revolve around aspects of ingroup-outgroup conflict. Such conflict is well known. Cases have been fictionalized in famous works, ranging from *Romeo and Juliet* to *West Side Story*, and can easily be found in historical accounts from the Greek city-states to Northern Ireland. However, it has received its most careful empirical study from the middle of the twentieth century onward.

From that time, research has shown surprising results about the extent to which we categorize ourselves as members of abstract groups, and the major effects on our behavior when we do so (see, e.g., Forsyth 1990, chap. 13). In so-called "Minimal Group Experiments" researchers constructed groups where individuals were allocated to one group or another on the basis of some irrelevant factor, but had no contact with other members of the group. Despite the fact that the groups had no substantial existence as groups with shared experiences among their members, members nevertheless tended very strongly to favor members of their own groups when allocating resources to

other individuals: they showed marked “in-group bias.” It seems as though often in seeing ourselves as group members we are abstractly categorizing ourselves, rather than apprehending genuine relationships we have with other individuals. What is striking is that even such abstract categorizations seem to have major effects on our behavior, as great in many ways as membership of groups of other individuals we know well, such as family members or work colleagues. We show pronounced tendencies to favor members of our own groups over others, and to see our own groups as more deserving than others, even when these groups are purely abstract categorizations.

It is because such group membership has such motivational effects that it is such a potent force in politics, and is the basis for identity politics, where summoning up people’s self-categorizations as members of one group rather than another can impel them toward defense of the first and derogation of the other. To summon them up is not hard. It seems only necessary to make salient the fact that people are members of one group rather than another: men, rather than women; Christians, rather than Muslims; Protestants, rather than Catholics, are all obvious examples. But identity groups can also emerge from people’s positions and commitments on specific issues: whether people are for or against gun control, or action on climate change, for example. Whatever the basis for group identification, simply calling to people’s minds such membership can be enough to prompt the instinctive motivation that goes with abstract group identification. Then, the motivation people have may not be based in genuine apprehension of injustice or disadvantage, and several ethical problems result.

One problem is that the ease with which group identification can be aroused invites its use as a tool of political manipulation. That this can be done was forecast in the early days of identity politics. Hobsbawm commented that especially in countries where parties compete for votes, “constituting oneself into such an identity group may provide concrete political advantages” (Hobsbawm 1996). People’s support for a cause on the basis of their identification with an abstract

group can be used for ulterior purposes quite removed from the well-being of the group or the real justice of its cause. Getting support in this way is a form of manipulation, drawing people into commitments and action that they might not support on the basis of reflective decision-making. A straightforward example not confined to electoral democracies can be a government’s stirring up jingoistic patriotic fervor to reduce opposition.

Another problem is the exaggeration of group differences and hostility on the basis of relatively minor cues. The oldest well-known example is in the Book of Judges, chap. 12, which recounts Gileadites identifying Ephraimites and killing them on the basis of their pronunciation of “shibboleth.” (A pity about Gileadites with a minor speech impediment.) Nowadays, similar hostility can be generated by expression of a view that is taken as contrary to the ideas that characterize a particular group. Just like a person’s color, or gender, or accent, expressing a particular view can be taken as a sign of outgroup membership. The result may be that the individual who expresses the view is immediately stigmatized, and no effective discussion is possible of the merits of the ideas expressed. Further still, apparently trivial acts by others may be seen by group members as expressive acts giving offence through impugning group identity, and the responsive hostility can further impede discussion and expression of ideas.

In that case, there is room to question the respect and consideration that is deserved when offence or indignation is born out of abstract group identification. More generally, it is not clear how much respect people deserve for commitments they have as the result of abstract group identification. In cases like the Minimal Group Experiments, where the groups in question were essentially fictional, the positive feelings individuals have toward the groups seem to merit no more respect and consideration than their feelings of sympathy and concern for fictional characters in a novel. That is not to say that they should be ignored or ridiculed, but feelings for a fictional character do not seem to have the same status as someone’s sympathy and concern for another real individual. Part of the reason seems to be that the

respect and consideration that ought to be given to people's feelings depend partly on the basis those feelings have, and the extent to which those feelings are proportionate to that basis. Along those lines, there is at least an arguable case that feelings of commitment and support that people feel for a group on account of abstract group identification deserve less consideration and respect than feelings that have a more concrete basis.

Argument along those line can be supported by making a distinction between individuals' narrative identity, on the one hand, and their social or group identity, on the other hand (Provis 2019). The idea of individuals' narrative identities has been emphasized in modern virtue ethics. Individuals' narrative identities are the stories their lives embody: the experiences they have, their relationships, successes and failures, and so on. Individuals anticipate the future and recall the past. Their hopes and fears and expectations, their regrets and successes, their friendships and families, make up a narrative, and that story offers a basis for respect and consideration. Such an identity can be seen to offer a basis for others' respect and consideration, to an extent that individuals' social or group identities may not seem to, when those latter identities are formed simply by the individuals' cognitive identification with a particular abstract group.

## Forms of Identity and Mingling of the Issues

Here, however, it becomes difficult to separate the two sets of ethical issues, issues about the processes of identity politics and issues about the claims made by opposing groups, because it can be difficult to separate individuals' narrative identities from their social group identities. Individuals' narrative identities can often incorporate aspects of their social identities. Their identification with abstract social groups can affect their fears and aspirations, and can affect their perceptions both of the present and the past. A wide variety of literature documents ways in which this can happen, and can then derivatively affect

individuals' decisions and actions, and their successes and failures. "Stereotyping" is a prominent example, where individuals may be treated (by others, or by themselves) on the basis of features that characterize membership of an abstract identity group, regardless of real characteristics of the individuals.

It is therefore not possible to push aside claims simply because they reflect people's identification with an abstract identity group. Their membership of such a group may affect their lives in concrete ways, and claims that reflect membership of the abstract group may also be grounded in those concrete effects. What may still be possible is to separate well-grounded claims from appeals that trade on the unreflective motivation associated with group identification, and from exaggerated responses that stem from it. It will be necessary to consider quite complex details in each individual case of identity politics. There is the issue first of identifying groups involved, what types of claims they are making, and how their various claims are related to one another and to those of other groups. Then, also there is the issue of determining to what extent the claims are authentic and grounded in genuine experience, or are unreflective responses to abstract group identification. Those steps may assist in working out what claims warrant consideration, but it will remain to be determined what actions can be taken in regard to them.

## Immigration and Business Ethics

J. Angelo Corlett  
Philosophy & Ethics, San Diego State University,  
San Diego, CA, USA

### Synonyms

American Indians (Native Americans); Borders; Business; Humanitarianism; Immigration; Indigenism; Protectionism; Racism; Unemployment; US blacks (African-Americans)

### Introduction

Immigration has various impacts on business and vice versa. For instance, oftentimes immigrants provide cheaper labor for businesses which can be passed down to consumers in the form of lower costs for goods and services. But immigrants often displace or create unemployment opportunities for otherwise working citizens in an economy. Does a government have either a right or a duty to close or otherwise control its borders? Or does it have a duty to open them in service to immigrants seeking better lives for themselves?

### Approaches to Immigration

There are various general positions on immigration. This discussion focuses on immigration in the USA, though it is hoped that the basic points made herein would apply generally to many other countries. One approach to immigration in

the USA is that reform is needed in that the borders of the country are overly porous such that the country's security and economic well-being are threatened. Given the real threats to the USA (and the rest of North America) and Central and Latin America in terms of global terrorism, and the violent illegal drug trade, the international borders of the USA, both north and south, must be secured. Furthermore, in light of the various economic costs of many recent immigrants to the US economy in terms of many such immigrants drawing from public assistance programs without contributing to the public economic good by way of paying significant income taxes, there must be boundaries as to whom and how many immigrants are permitted into the USA. I shall refer to this as the "protectionist" approach to US immigration policy. This protectionist approach has variants. But I shall discuss the approach in general terms.

While many advocates of protectionism seem to fixate on the southern border and the "browning of America," there is no reason why protectionism ought to adopt such a limited and apparently racial<sup>1</sup> standpoint. Undocumented immigrants can and do more easily enter the USA from the Canadian border than they can cross the US-Mexican border given the vast differences in US Border Patrol resources allocated to the protection of said border. Nonetheless, economics and safety are significant concerns of protectionists who seek reform of the current US policy of immigration and its enforcement.

But humanitarians are in the end less impressed by such concerns, arguing that the vast majority of those immigrating to the USA are honest, hardworking people who deserve to be granted the same sorts of opportunities which so many other immigrants were granted throughout US history. To fail to do so would be

<sup>1</sup>I use "racial" instead of "racist" in that it is more obvious that this approach to US immigration policy reform recognizes such immigrants as racial or ethnic persons, yet unlike the oft repeated yet unsupported charges of this approach being racist, we do not have sufficient reason to think that such a view, though racial, is necessarily or always racist.

discriminatory in an unacceptably morally arbitrary way and would fail to understand that economic and public safety arguments against further immigration or in favor of drastic reductions in the size of the recent immigrant population in the USA are outweighed by moral considerations that are compassionate and humanitarian in nature. It would be a kind of pulling up of the immigration ladder, as it were, a closing of the “floodgates” to the rest of those seeking better opportunities for themselves and their families. And this holds true even if the net cost of such immigration to the US taxpayer is significant. As in the case of protectionism, humanitarianism admits of variant positions.

However, while the protectionist and humanitarian approaches are the most popular lines of thought on US immigration issues, I seek to resolve the apparent dialectical stalemate by developing for consideration a more nuanced analysis. I prefer to think of this approach as a kind of responsible humanitarianism, one which is anchored in an indigenous perspective. Immigration indigenism is the approach to immigration which recognizes the either occupational or ownership moral right to territory an indigenous group has to the extent that the group has a valid moral claim to or interest in the territory in question. It is grounded in a kind of territoriality thesis according to which the moral right to control its own territorial borders accrues to a state to the extent that that state is not in violation of the “principle of morally just acquisitions and transfers” with regard to the territory it claims as its own. The principle of morally just acquisitions and transfers states that whatever is acquired or transferred by morally just means is itself just, and whatever is acquired or transferred by morally unjust means is itself unjust, and it implies that to the extent that a state resides on territory that it has acquired without violating the moral rights of others is the extent that that state has a moral right to that territory (Corlett 2010). Likewise, to the extent that a state has violated the rights of others in the acquisition of the territory on which it resides is the extent to which that state has no overriding moral right to the territory on which it resides. More specifically, to the extent that

American Indians<sup>2</sup>, for instance, still possess moral ownership or occupational claim rights to the territory within the USA given the history of US-Indian relations, and to the extent that those rights to at least singularly occupy as sovereign nations such territories have been violated by the flood of morally unjust “immigrants” into what is now called the “USA,” it would appear that, morally speaking, indigenous rights must be respected by any viable immigration policy of the USA. And if American Indians still possess their moral rights to the lands in question based fundamentally on the principle of morally just acquisitions and transfers, then it would appear that their well-being (including the moral right of American Indians to without impedance numerically flourish in their own space) must become a central feature of any moral rights-respecting policy of immigration.

Moreover, it would appear that American Indian rights to compensatory justice for the evils experienced by them at the hands of the USA ought to be respected, and part of such a reparations policy would be for the USA to discontinue its policies which would threaten American Indian rights thereto (Corlett 2010). These include American Indian rights to flourish culturally, absent further significant environmental damage to the territory that is genuinely and morally theirs. Put simply, US population growth must be curbed in order to in turn better ensure

<sup>2</sup>By “American Indian” is meant those peoples indigenous to what is currently referred to as the “United States of America.” Even though historically such peoples were misidentified by certain explorers as being Indians from India where the explorers thought they landed at the time, most peoples indigenous to the USA refer to themselves as “Indians” (as well, of course, by way of tribal affiliation), and out of respect for them I do so here as I do elsewhere in my published research. This linguistic custom differs from some other regions of the world wherein indigenous peoples are referred to as “First Nations” (Canada), “Aborigines” (Australia), etc. Indeed, in the USA, many non-indigenous people refer to indigenous peoples as “Native Americans,” a label, much like “Hispanic,” which is rejected by several to whom the labels refer in that the labels originate from out-group members (e.g., the USA government). I am indebted to Professor Deborah C. Poff for urging clarification of this matter.

the quality of life for those Indians and others already in the USA in terms of adopting more demanding antipollution standards in order to combat further adverse climate change, increase food production, protect and improve the quality of water and air supplies, decrease waste disposal, etc., each of which addresses significantly the improvement of wetlands, quality and length of service of various aspects of the country's infrastructure, and the like. Yet human population control in the USA is rarely taken sufficiently seriously. These and whatever other concerns affect the well-being of American Indians, and their abilities to regain their proud cultures and significant portions of their lands are vital to this indigenous perspective.

There are those who assert that "it is far from self-evident that the United States is overpopulated..." and that overpopulation concerns with immigration amount to "scare tactics" (Johnson 2007: 158–159). It represents the environmental argument against immigration to be one of protectionist egoism. It even avers that the USA is by and large an environmentally friendly society. And immigrants, in becoming residents or citizens of the USA, would adopt US customs of environmental respect, thereby alleviating to some extent the more global problem of environmental problems. These factors militate in favor of a liberal US immigration policy (Johnson 2007: 158–159).

On the contrary, the USA is one of the world's most harmful societies to the environment (even if it is true that, comparatively speaking, the USA is more environmentally friendly than many other countries). One need only point to the US policies permitting offshore drilling by oil companies and the many disasters resulting from it that is fueled in large part by US citizens' demand for oil as one of the several examples of how US citizens just do pollute and use more natural resources than most other peoples throughout the world. Also problematic for the environment is the US practice of "fracking" in order to extract natural gas. The USA is considered by most to be a "throwaway society" in terms of consumer waste disposal. So the idea that immigrants to the USA would in general become more environmentally conscious

than they would be in their home countries does not serve as a justification for liberal immigration policy in the USA, that is, if it is reasonable to expect that immigrants would generally emulate environmentally problematic lifestyles. Second, the presumption that the USA is not overpopulated is problematic insofar as overpopulation is construed in terms of the ratio of the human population to available sustainable resources. The USA is crippled with overcrowding in not only its ten largest cities but in several others as well. And the idea that a liberal immigration policy would be a way to populate less populated areas seems to presume that most such immigrants would desire to reside in such areas. The claim that the USA is overpopulated is a mere scare tactic, is itself a counter scare tactic of a humanitarian bent, and refuses to listen to the scores of ecological scientists who have repeatedly cautioned of the US population crisis during the past half-century. Increased population translates directly into increased usage of bridges and roadways, buildings, and such, requiring increases in employment and natural resources to sustain such people, all of which is highly questionable in the case of the USA as it is currently populated. An open door policy, or even a liberal immigration policy, is irresponsible because it fails to see that unrestricted human population growth of any society can eventually contribute to societal destruction as no territory has unlimited natural resources to support unlimited growth. Even if, as is currently the case in the USA, human population birth *rate* is in decline, it does not follow that there is no human overpopulation in the USA, especially when one important issue to consider is the future level of well-being for both the current human population and its immediate offspring and their impacts – both positive and negative – on the global environments. I shall refer to this as the "net effects of human overpopulation over time." And it should be noted that even if it were true that such effects seem not to pose problems for immigrant peoples in the USA, it is difficult to countenance the idea that those effects have not often adversely affected American Indian peoples.

Joseph H. Carens has recently argued that “Irregular migrants should be granted amnesty—allowed to remain with legal status as residents—if they have been settled for a long time. Some circumstances—arriving as children or marrying citizens or permanent residents—may accelerate or strengthen their moral claims to stay, but the most important consideration is the passage of time” (Carens 2010: 5–6; also see 50–51). Carens notes that the “crux” of his argument is that “irregular immigrants” form social relations within the states to which they immigrate and become social members by way of forming bonds with others: “People who live and work and raise their families in a society become members, whatever their legal status” (Carens 2010: 18). Due to this fact, “over time, the circumstances of entry grow less important. Eventually, they become altogether irrelevant” (Carens 2010: 19).

However, in response to Carens’ points, it might be argued that it is problematic to understand how “irregular immigrants” become socially related to the state by breaking one of its basic laws and by disrespecting the state’s right to restrict its own borders. This is a curious kind of social relationship. So while it is plausible for Carens to point out that irregular immigrants become socially involved within the state to which they migrate, this does not equate to their becoming socially involved with the state itself, especially in light of the fact that illegal immigration disrespects the state in such fundamental terms, as noted. Carens’ argument for amnesty for irregular immigrants is an intuition-based one wherein he constantly resorts to *ad hominem* rhetoric, referring to deportation or restricted borders policy as “a moral absurdity” (Carens 2010: 9), “morally wrong” (Carens 2010: 11), “unreasonable” and “cruel and inhumane” (Carens 2010: 12), “a harm done to someone in forcing him or her to leave” (Carens 2010: 25), “simply wrong” (Carens 2010: 47), etc. (Carens 2000). Yet he uses these as reasons when they are in fact conclusions for which he is supposed to supply independent and non-question-begging supporting argument. Thus Carens’ argument for a kind of “rolling amnesty” (Carens 2010: 49) regarding irregular immigrants collapses. An approach to US

immigration is not supposed to essentially constitute both the premises and conclusion for one’s position. It is a conclusion that is supposed to be grounded in independent reasoning.

To be clear, Carens’ thinking is not intended to repudiate a state’s right to control its borders but rather to place constraints on that right (Carens 2010: 27). On his view, the state has a right to deport those who immigrate illegally so long as that deportation occurs early in the stage of the immigrant’s stay in that country (Carens 2010: 27). And Carens recognizes the moral arbitrariness in stating just how long it must be before an illegal immigrant is rightly deported when caught. This latter point leads Carens to claim that the USA is somewhat “complicit in irregular immigration” (Carens 2010: 27), thereby making the moral case for amnesty for such immigrants in that its “failing to enforce immigration laws and controls when it could do so, the state bears considerable responsibility for the results of its inaction” (Carens 2010: 28). Now Carens is quick to point out that “one cannot charge the state with complicity simply because of its failure to deter unauthorized immigration” (Carens 2010: 30). However, “[a]ctual complicity, in the form of deliberate lax or fluctuating enforcement, does undercut the state’s right to deport irregular migrants” (Carens 2010: 31). But it might be argued against Carens’ point that this is a rather fine distinction, perhaps overly so such that the burden of moral argument rests with Carens to demonstrate that, say, the USA has been genuinely lacking in its attempts to control its borders.

Indeed, the USA perhaps spends more than any other country on border enforcement, and its fluctuant border enforcement can easily be traced to political factors as US citizens and their politicians wrestle with the morality of immigration. Carens goes on to assert that “[t]he laws restricting immigration are a lot more like traffic regulations than like laws prohibiting murder and theft” (Carens 2010: 43). And he likens his desire to institute a moral statute of limitations on deportations of long-settled irregular immigrants to the legal statutes of limitations on various crimes in US law (Carens 2010: 44). But the reason he provides for this parallel is that “it is not right to make

people live indefinitely with a threat of serious legal consequences hanging over their heads for some long-past action, . . ." (Carens 2010: 44).

However, there are at least two problems with this line of thought. First, it wrongly places the burden of coercion on the state which Carens already concedes possesses a right to restrict its own borders. Why not construe the irregular immigrant as the one who in most cases and to a significant extent knowingly, intentionally, and voluntarily places herself in this predicament instead of blaming the state for restricting its borders? Secondly, Carens' statement does not capture some of the particulars of why there are legal statutes of limitations on certain crimes. It is because over time, evidence, whether physical or testimonial, becomes problematic. Physical evidence can be lost or damaged and no longer usable in a court of law; witness testimonies can become blurred due to memory loss. Yet none of these factors applies in the typical cases of irregular immigrants. Immigration status can be readily verified, and there is therefore no excuse for being in a country wherein one has not gone through the legal procedures of entry and stay. It is not only illegal, but morally speaking, it is disrespectful toward those who are legal citizens as one effectively enters their "home" without their permission. It is a form of trespass. And unless it is a genuine case of one's escaping their homeland to save their life from immediate physical persecution and highly probable or certain death wherein certain version of good Samaritanism might well apply (I understand such cases to constitute ones of refugees), it is difficult to construe even the irregular immigrant as one who is not just a potentially thieving trespasser: a trespasser for obvious reasons, a would-be thief to the extent that the likelihood of her displacing a citizen from an employment prospect or her actual job is significant, and an actual thief to the extent that she as an irregular immigrant displaces a citizen from her reasonably potential employment. Thus Carens' attempt to draw a parallel between legal statutes of limitations on certain crimes, on the one hand, and a moral statute of limitations on irregular immigrants and their deportation, on the other, fails, as does his try at

shrouding irregular immigrants' unconcern for US citizens struggling to combat their own unemployment or dubious current employment future with such immigrants' struggles with their own personal betterment.

But there are deeper problems with the notion of open or minimally restricted borders as a moral duty of countries such as the USA. Just as John Rawls' separateness of persons objection (Rawls 1971: 23f.) to classical utilitarianism serves as a reason to reject classical utilitarianism's attempt to aggregate social utility over rights, an immigration policy which seeks to open US borders with few or virtually no restrictions for the good of the world or of most others runs the serious risk of violating this vital Rawlsian ethical concern. And it may do so in one of at least two ways. First, it may do so by violating the rights to freedom and privacy of US citizens as individuals. Second, it may do so by violating the rights of certain collectives within the state to freedom and sovereignty, or even the state itself, for each individual and group within the state has rights that include the valid claim to or interest in self-development and the pursuit of projects that might well not encompass the claims of others to immigrate to the territory in which they live. Indeed, such projects and interests of such peoples may well clash, posing a threat to those in the target state. It is for this reason that the concept of restricted borders by morally legitimate societies must be written into the very essence of any plausible immigration policy.

What is being argued here can be put in another way in order to highlight the kinds of moral values which underlie the argument for an indigenist approach to immigration. The argument is a conditional one which assumes some propositions which receive independent argumentative support elsewhere, as indicated above. Assuming that moral rights are valuable, including such rights as privacy and property rights and autonomy and sovereignty rights, it is argued that open borders approaches to US immigration essentially pose threats to such rights by trumping them with a utilitarianism which seeks to make the world better for the greatest number of humans. It is *not* that a pro-immigration stance *necessarily* poses

threats to the rights of those in the USA. Rather, it is that whatever else a plausible immigration policy does, it must not undermine the valid moral claims or interests of those already in the USA, such as American Indians who are its most indigenous inhabitants. For given the history of migration into North America, immigration policy must seek to and achieve at least this much: It must not continue the undermining of the rights and welfare of American Indians.

While it is true that indigenism of the strict variety would adopt a zero human population growth policy of immigration concerning the USA, implying a zero tolerance for immigration, more moderate (realistic and integrationist) indigenism might opt for a more inclusivistic approach to the problem, working on the assumption that American Indian rights can realistically be respected by the USA in terms of its reformation of its immigration policy. But exactly what might such reform look like? In answering this question, it is important to provide some principles of justice with regard to immigration policy. These vital questions remain to be addressed elsewhere.

## Conclusion

Amidst the confusion that often accompanies debates about immigration, there is a great deal of presumptuousness on the parts of humanitarians and protectionists. One presumption that neither side has taken seriously is the moral fact that and how the territoriality thesis and the principle of moral just acquisitions and transfers apply to and ought to figure into the discussion. When they are taken seriously in immigration discussions, they point to the importance of the rights to American Indians to their lands and their cultural preservation, rights which are violated under current US immigration policy and rights which are likely to continue to be violated or ignored under an open borders “humanitarian” approach to immigration. Whatever else a sound immigration policy must support, it must adequately support indigenous rights to what are, morally speaking, their territories and cultures. And while this is especially the case with regard to matters of

immigration in the USA, it is likely to have an effect on the complexities of discussions of immigration in many other geographical locations throughout the globe.

Inclusivity and Diversity on Corporate Boards

## Introduction

There has been increased interest in the impact of board diversity on corporate social responsibility (CSR) across heterogeneous business disciplines

and by expert academics. The research has grown from focusing mainly on the impact of gender diversity to various other aspects of diversity, including observable (e.g., age and race) and non-observable (e.g., education and occupation) characteristics. This chapter will provide an overview on board diversity theories, definitions, diversity trends, CSR, the relationship between board diversity and CSR, and various aspects of board diversity. Additionally, the chapter will present future research recommendations in areas pertaining to board diversity and CSR.

## Board Diversity

Board diversity research has gained much momentum in recent years, causing a myriad of research papers to emerge in the field. Several governments of countries have recognized the growing importance of diversity reflected in the mandating and regulatory reporting of gender quotas on the board. This has fueled an even greater range of studies, along with more contextually focused contributions. In this section the definitions of diversity, board diversity theories utilized by researchers and the various impacts of board diversity will be explored.

### Board Diversity Definitions

Countless definitions exist for board diversity. Simply put, the term “board diversity” signifies an array of “constructive differing” among members on the board. An analysis of board diversity definitions by Kagzi and Guha (2018) found that board diversity entails three classifications: (1) observable (e.g., gender, age, and race) and non-observable characteristics (e.g., functional background and education); (2) diversity of board structure (e.g., size of the board tenure and CEO duality); and (3) functional related diversity (e.g., education and work background) and non-functional related diversity (e.g., gender, age, and nationality).

Harrison and Klein’s (2007) definition of diversity has become highly recognized and esteemed in the field, as a broad-brush and yet relevant, applicable and workable meaning. The authors suggest that diversity construct consists of

three types: separation, variety, and disparity. Separation refers to inconsistency in opinion while variety refers to inconsistency in kind and classification, and disparity refers to an imbalance in level of authority and in backing (Harrison and Klein 2007).

### Board Diversity Theories

Evident in the scholarly debates, researchers often encounter contradictory positions and opposing findings in examining impact as outcomes of board diversity. Kagzi and Guha (2018) highlight that this could be attributed to selection of underpinning theory. Generally, the board diversity theories that more often demonstrate a positive impact of board diversity consist of resource dependence (RDT), upper echelon, signaling, networking, and behavioral theory. On the other hand, agency, social identity, and social characterization theory have more often demonstrated negative impacts of board diversity. Kagzi and Guha (2018) note that each theory can be engaged to explore different ethical attributes or duty of the board. Comparatively, resource dependence theory explores the positive impacts of board diversity from the availability of resources viewpoint while agency theory looks at the impact of board diversity from a board monitoring outlook.

### Diversity Trends

Beyond the widely reported 2008 financial crisis, the failures and concerns about larger private companies and their dependencies and affects have persisted, for example, Thomas Cook, VW, and Facebook. The public awareness and accountability aspects have led corporations, regulators, and governments to carry out extended research on enhancing the effectiveness of board, to the board directors themselves. Initially, the bulk of research focused on the impacts of board gender diversity. Since discovering some promising results, researchers have attempted to advance these early research trends by examining additional aspects of observable and non-observable board diversity attributes (Harjoto et al. 2015). The more recent studies have delved into

unexplored surface level and deeper non-observable and more personal attributes of diversity, including growing interest in foreign diversity (Velte 2017), board members' occupational backgrounds/expertise (Harjoto et al. 2015), and their age and tenure influences (Feng et al. 2020).

## CSR Trends

The concept of corporate social responsibility has existed for many decades and has evolved over time to accommodate a rise of cross-cultural influence and changes. CSR is underpinned by ethics as deontological, normative (moral), and utilitarian. In recent times, calls for greater transparency and higher standard of ethical conduct are being shaped by pressing environmental concerns, and calls for anthropogenic sustainability and attention from governments, intergovernmental organizations (e.g., the United Nations), and unions (e.g., the EU) have driven changes in the type of CSR in which companies engage (ElAlfy et al. 2020). ElAlfy et al. (2020) maintain that this has led to the trend of adopting transparency to an unparalleled degree, as well as attention to balancing shareholder and stakeholders through higher levels of disclosure as a step toward more eco-friendly sustainable accountabilities of business/corporate activities.

To better comprehend the development of CSR, it is integral to realize the influence of sustainability trends and goals set by unions and intergovernmental organizations on CSR practices (e.g., reporting), strategy, transparency, and regulation. ElAlfy et al. (2020) believe that the Sustainable Development Goals put forth by the United Nations have substantially impacted the way companies engage in CSR into sustainably and strategically aligned approaches. This change has been particularly prevalent in research on CSR. Using a scoping review, ElAlfy et al. (2020) discovered that papers analyzing CSR and Sustainable Development Goals (SDG) have increased by about 55% from 2015 to 2019. Some papers take a blanket approach to CSR and SDG, for instance, analyzing board diversity and

sustainability, while others look at specific SDGs (ElAlfy et al. 2020).

Furthermore, there has been a trend to converge the definitions of corporate sustainability (CS) and corporate responsibility (CR) in recent literature, obscuring the differences between the two. Bansal and Song (2017) discovered that former definitions of CS and CR are more pronounced than recent definitions. Initial research on responsibility revolved around social issues while initial research on sustainability centered on environmental concerns; however, the differences have converged over time as responsibility researchers recognize that management of the environment is a social issue and sustainability researchers acknowledge that society contributes to environmental concerns.

## Relationship Between CSR and Board Diversity

Researchers draw consensus that there is a positive relationship between CSR and board diversity (Harjoto et al. 2015; Feng et al. 2020; Bear et al. 2010; Velte 2017). A diverse board brings diverse experiences, backgrounds, information, understanding, expertise, and viewpoints together in regard to corporate decision-making. Therefore, diversity boosts competence on the board when dealing with stakeholder needs and CSR performance (Harjoto et al. 2015) and the ability to connect the corporation with its CSR resources (Feng et al. 2020). The following subsections will examine the relationship between CSR and various aspects of board diversity, including observable characteristics such as gender, nationality, race, and age and non-observable characteristics such as occupational background, education, board independence, and board tenure.

Researchers use both qualitative and quantitative methods to study board diversity, with quantitative research being more predominant (Kagzi and Guha 2018). To measure CSR, some researchers use CSR ratings or CSR performance indicators such as the KLD (Bear et al. 2010; Harjoto et al. 2015; Feng et al. 2020) while others utilize CSR reporting (Velte 2017). Researchers

can also measure CSR by examining the number of companywide CSR initiatives, the frequency of CSR discussion on the board, the prominence and degree of CSR policies, and more.

The measurement of board diversity also varies for different researchers. Some measure diversity in terms of categorizing a board with diversity as heterogeneous and a board that lacks diversity as homogeneous instead of looking at a specific diversity characteristic such as gender; others measure diversity by looking at various diversity indexes (Kagzi and Guha 2018). Diversity can also be measured by studying each board diversity aspect individually, allowing researchers to differentiate between and compare various diversity characteristics.

### Gender

Gender diversity on boards is by far among the most researched topics in the field of board diversity. Broadly, researchers have found a positive relationship between board gender diversity and CSR (Harjoto et al. 2015; Kagzi and Guha 2018; Bear et al. 2010). While many studies on the impact of gender diversity have found positive linkages, they differ in methodology. For instance, Feng et al. (2020) explore the link between board gender diversity and CSR scores. Researchers also assess the relationship of board gender diversity to different outcomes. For instance, Bear et al. (2010) examine the relationship between the number of women on the board, board resource diversity, and the overall reputation of the corporation. Researchers can then examine CSR with the different outcomes assessed. Bear et al. (2010) utilize this method when assessing the relationship between CSR ratings and corporate reputation (stemming from the theory that board gender diversity enhances board reputation).

Each of the above studies found a positive relationship between CSR and board diversity (Bear et al. 2010; Feng et al. 2020) and CSR and reputation (Bear et al. 2010). Additionally, Bear et al. (2010) discovered that institutional and technical strengths act as mediators to the relationship between corporate reputational and board gender diversity.

### Occupational Background

As with many of the non-observable diversity characteristics, occupational background is relatively understudied. Harjoto et al. (2015) provide research on various aspects of board diversity, including occupational background. The researchers acquired data on board diversity in terms of expertise utilizing a heterogeneity index and categorized the directors' expertise by the scope of services they offered and employment groupings. These were split into five fields consisting of legal, financial, management, consulting, and other (e.g., the medical profession, researchers, information technology).

The researchers discovered that boards were generally more diverse in terms of occupational background, board independence, tenure, and age of board members than for other diversity measures. Additionally, diversity in terms of expertise positively impacted the overall CSR of the company because it reduced CSR concerns (Harjoto et al. 2015). Although this research does a good job of tackling the occupational background aspect, it fails to account for directors that have a number of different areas of expertise, such as those that possess expertise in both finance and law, management and research, etc.

### Race

Race, an observable characteristic, has often been studied in the context of board diversity in the Western context. Harjoto et al. (2015) examine whether board race diversity has an impact on CSR in the United States. The researchers define race using a heterogeneity index as being one of five categories: Caucasian, Asian, Black, Native American, or Hispanic. They found that race does impact CSR practices by reducing concerns in the areas of environment, corporate governance, human rights, employees, community, and product (Harjoto et al. 2015). However, the research indicates that diversity of race is more strongly correlated with minimizing concerns in regard to CSR than increasing the CSR strengths of the company. It should also be noted that during the second stage of regression analysis (two-stage least squares) conducted by Harjoto et al. (2015),

the results suggest that there is no relationship between diversity of race and CSR concerns.

### Age

Age diversity is rarely examined by board diversity researchers. This could be because board members are usually close in age due to the level of experience required to serve on a board. However, modern boards are changing, and this area needs closer examination. The existing research typically points to a negative impact of age diversity on CSR (Harjoto et al. 2015; Feng et al. 2020).

For instance, Harjoto et al. (2015) examined age diversity by categorizing director age into five groups using a heterogeneity index: under 40, 40–49, 50–59, 60–69, and 69+. The researchers found that diversity in age had a negative relationship with CSR. Similarly, Feng et al. (2020) measured age diversity with the help of an index and found a negative relationship between age diversity and general CSR scores. To take it a step further, Feng et al. (2020) examined the influence of age diversity on various components of CSR and discovered that age had a negative impact on six areas of CSR (human rights, product, employees, environment, and corporate governance) but had a positive impact on the area of CSR diversity. The researchers believe that people coming from a variety of generations might have dissimilar values, norms, knowledge, experiences, and goals, resulting in decision-making handicaps. However, this argument is not believed to be compelling, and future researchers need to dig deeper to understand the impacts of age diversity.

### Education

Educational diversity, a non-observable form of diversity, can be studied in many ways. Researchers could analyze this by looking at the board members' fields of education (e.g., law and engineering), the variations of degree level (e.g., MBA, PhD), or any other educational variety indicators. Harjoto et al. (2019) analyzed the impact of educational diversity in terms of the regions in which the directors earned their undergraduate and graduate degrees. The researchers

split the regions into eight groups: Africa, Asia, Australia, Eastern Europe, Europe, North America, and South America. Furthermore, the directors were split by the regions in which they earned their degrees as a percentage of board size. Harjoto et al. (2019) found that there was a significant positive relationship between regional diversity in which directors received their degrees and corporate social performance.

### Nationality

Board national diversity refers to the diversity of nationalities of those serving on the board. National diversity is generally considered an observable diversity quality. Only a handful of papers have looked into national diversity; one of the most notable is conducted by Harjoto et al. (2019). Much like in their study of educational diversity, Harjoto et al. (2019) categorized the board members by nationality based on eight regions and measured director nationality by region as a percentage of board size. Similar to the research on educational diversity, there was a significant positive relationship between national diversity and corporate social performance.

### Board Tenure

Board tenure refers to the number of terms served on the board. Harjoto et al. (2015) measured tenure using a heterogeneity index to categorize the number of terms on the board from one term to more than five terms. The researchers found that board tenure diversity improved the total CSR scores because it minimized CSR concerns (Harjoto et al. 2015).

### Board Independence

Board independence, defined as the proportion of independent directors on the board, is heavily referenced in the board diversity literature. Velte (2017) believes that board independence and gender are increasingly used as placeholders in favor of board effectiveness. It seems that firms with more board independence benefit from external monitoring, making them more conscious of CSR (Harjoto et al. 2019). Harjoto et al. (2019) found a positive relationship between board independence and corporate social performance.

## Future Research Recommendations

Future research could look into improving the literature on both observable and non-observable board characteristics. A literature review by Velte (2017) found that most of the research in this field focuses on aspects such as board independence; factors such as board expertise and occupational background were infrequent. Velte (2017) predicts that from a quantitative standpoint, it would be tedious for researchers to examine the resumes of each board of directors and then code the data; however, he notes that financial expertise or CSR expertise suggest suitability for a capable CSR reporting system. Future researchers could look into directors with backgrounds in PR, branding and marketing, CSR, corporate governance, etc., to identify whether a relationship exists between occupational background and CSR. Additionally, future research could look into directors with an occupational background in more than one area and explore the impact, if any, on the company's CSR practices.

Additionally, more precise research can be achieved in relation to race diversity. Harjoto et al. (2015) divide race into five categories: Caucasian, Asian, Black, Native American, and Hispanic. While this definition is suitable for the United States, it would not hold up well in different contexts. For instance, if this study was conducted in the United Arab Emirates, grouping Arabs as Caucasian and both Japanese and Indians as Asian would not indicate the true level of diversity present on the board. However, in the context of the United States, where the definition of race is generally standardized, this definition is satisfactory. It is recommended that future researchers look at a more precise definition of race that includes subcategories, such as splitting Asian into South Asian and East Asian. This could be achieved by examining ethnicities rather than race.

Furthermore, future researchers could look at the impact of executive education on the board on CSR practices as it is believed that the nature/agenda of executive education in business schools shape future leaders perspectives of CSR/ethics.

This field of research has adequately demonstrated the relationship between board diversity

and CSR but has yet to discover why or how these relationships exist. This could be achieved in future research by opting for a qualitative or mixed methods approach. If executed correctly, a qualitative approach would delve deeper into the relationships between diverse board members and CSR.

## Conclusion

Research on board diversity is growing rapidly. Researchers are shifting from a focus on the impact of gender diversity to researching various aspects of diversity. Additionally, research on CSR now often includes sustainability and Environmental Social Governance trends. New board diversity theories are continually being developed and refined. Research on the impact of board diversity on CSR has yielded positive results; nevertheless, gaps in the research persist, such as the lack of qualitative research, which could be explored further.

## Implications of Mindset Theory for Ethical Decision-Making

Bradley Pomeroy

School of Accounting and Finance, University of Waterloo, Waterloo, ON, Canada

## Synonyms

Mindset theory of action phases; Motivated reasoning

## Introduction

The Nintendo Switch is one of the fastest-selling video game consoles in history, with more than 14 million units sold within its first year of release (Nintendo Co., Ltd. 2018). Contrast that with Nintendo's previous console, the Wii U, a sales disappointment, with less than 14 million units sold during its four-year life cycle (Mochizuki 2017; Nintendo.co.jp 2018). Nintendo management experienced difficulties accurately estimating demand for both consoles, but the excess supply of Wii U consoles likely presented the

more challenging accounting decision – namely, the appropriate amount to write-down inventory to account for a decline in value due to lower than expected sales.

As with many amounts presented in company financial statements, inventory write-down is an accounting estimate that is based on management's assumptions about uncertain future events and conditions. Accounting estimates are important to users' (e.g., shareholders') understanding of company financial performance not only because the reported amounts are material to the financial statements but also because they are highly sensitive to changes in management's assumptions (Christensen et al. 2012).

To estimate the decline in the value of its Wii U inventory, management would have considered, among other factors, their plans to stimulate demand for the console and internal sales forecasts. The management recognized early in the Wii U's life cycle that a price reduction would be necessary to stimulate demand and responded by dropping the US retail price by \$50 per unit (Nintendo.com 2013). Anticipating that the price drop and other plans to stimulate demand would succeed, management's financial forecast included the assumption that nine million Wii U consoles would be sold in fiscal year 2014 (Nintendo Co., Ltd. 2014b).

Actual sales of 2.72 million units would fall far short of management's expectations and, largely to account for a decline in the value of the Wii U console, Nintendo ultimately recorded a \$222 million USD inventory write-down in its 2014 fiscal year end financial statements (Nintendo Co., Ltd. 2014a). The unanticipated low demand for the Wii U provides a striking example of the challenges involved in making accounting estimates that appropriately capture the impact of uncertain future events and conditions.

Many challenging accounting decisions are also ethical decisions as financial statement users are vulnerable to making economic decisions on the basis of misleading information, including estimates that depend on unrealistic or biased assumptions by management. Management's assumptions are subject not only to cognitive bias, such as the tendency to believe that their

plans are less likely to fail compared to others' plans, but also to incentive-driven bias to avoid disclosing bad news as their compensation is based to a large extent on meeting short-term income-based performance targets (Kothari et al. 2009).

Bias in management's assumptions can persist even when they are developed in consultation with outside experts whose actions are bound by a professional code of conduct, such as actuaries and accountants (Gunz et al. 2009). The conditions are right for bias to persist when such experts are also engaged by management to provide advisory services that place them in a conflict of interest position – one that impairs their objectivity by incentivizing them to arrive at assumptions that correspond with management's preferences (Gunz et al. 2009).

Users recognize that financial statement information is susceptible to management bias and that management has more information about the company's true performance than they do. This information asymmetry engenders distrust, putting the efficient functioning of financial markets at risk.

As independent public accountants, auditors serve a key role in bridging the trust relationship by providing users with comfort that management's financial statements are free from material misstatement (Pentland 1993). However, auditors can be fallible; like management, auditors' judgments are subject to cognitive biases that limit their ability to objectively evaluate management's accounting decisions. Also, like other professionals, auditors can be placed in a conflict of interest position (Bazerman et al. 1997, 2002; Moore et al. 2006).

Even in a regulatory environment that promotes auditor independence by prohibiting management from engaging the auditors to provide certain advisory services (Nelson 2006), auditors still seek to establish positive working relationships with management to ensure they secure the audit contract (Bazerman et al. 2006; Fiolleau et al. 2013). The desire to maintain such relationships makes auditors susceptible to influence from management, even when they have every

intention of being impartial (Bazerman et al. 2002; Moore et al. 2006).

The remainder of this entry focuses on how the mindset theory of action phases (Gollwitzer 2012) can be used to explain why auditors are subject to one particular cognitive bias that influences how they evaluate management's accounting decisions – goal-oriented motivated reasoning.

### Auditors' Motivating Reasoning

Auditors are susceptible to many of the same cognitive biases as the general population. For example, auditors' judgments reflect anchoring stemming from the fact that they typically have knowledge of the amounts contained in management's draft financial statements before beginning their audit work (McDaniel and Kinney 1995). However, unlike anchoring documented in the general population, auditors' judgments reflect a form of anchoring that is more attuned to, and more resistant to adjustment from, negative information as compared to positive information (Smith and Kida 1991). In other words, auditors give more consideration to information that calls into question management's accounting decisions than they do to information that supports such decisions. This form of anchoring is referred to as conservatism (Smith and Kida 1991).

Auditors' conservatism reflects their training as public accountants, which promotes a skeptical mindset that is alert to information that could call into question the appropriateness of management's accounting decisions and conditions, such as whether management is under intense pressure to meet short-term performance targets, that could give rise to materially misstated financial information. Despite a duty to act in the public interest, and training that promotes an unbiased mental attitude and a conservative disposition, auditors engage in goal-oriented motivated reasoning – the tendency to search for, process, and evaluate information in such a way that allows individuals to arrive at their preferred conclusions (Kunda 1990).

Auditors' motivated reasoning stems in part from their incentives to maintain positive working

relationships with management. If auditors are highly critical of management's accounting decisions, then they risk damaging the relationship and potentially losing the client. Researchers surmise that the possibility of losing a client over an accounting dispute becomes unthinkable when the auditor is engaged not only to perform the audit service but also non-audit advisory services (Bazerman et al. 1997, 2002; Moore et al. 2006). Thus, many financial statement users are concerned that the joint provision of audit and non-audit advisory services creates an economic bond between the auditor and the client (Firth 1997) – one that impairs auditors' ability to objectively evaluate management's accounting decisions.

Until high-profile accounting scandals in the early 2000s (e.g., Enron) stimulated regulatory action (e.g., the Sarbanes-Oxley Act) that prohibits audit firms from providing their audit clients certain advisory services, there existed a perception that auditing is a commodity service that audit firms offer to their clients at a loss as a foot-in-the-door technique to secure profitable consulting contracts (Zeff 2003). Even with regulation in place that prevented audit firms from treating the audit service as a stepping stone to grow the advisory practice, the 2008 global financial crisis renewed users' concerns that auditors cannot be expected to maintain their independence from management if audit firms are permitted to build long-term relationships with their clients (CPA Canada and CPAB 2013).

For example, KPMG has audited General Electric (GE) for over 100 years and received \$140 million in fees for all services provided to GE in 2017 (Erickson 2017; Fino 2018). Shareholders are concerned that the long-term relationship between KPMG and GE and the high fees that it generates are a threat to audit effectiveness (Egan 2018). It is not that the auditors are motivated to intentionally collude with management to mislead users. Rather, the concern is that the desire to maintain the relationship (i.e., to keep the client) motivates auditors to adopt a goal of supporting management's preferences, even when they have every intention of being objective (Bazerman et al. 2002). This unintentional bias has been referred to as moral seduction (Moore et al. 2006).

To achieve their goal, auditors process information in such a way that they arrive at management-preferred conclusions (Kadous et al. 2003). For example, when evaluating management's estimate to account for a decline in the value of inventory, auditors who adopt a goal of supporting management's estimated write-down amount might seek out information (e.g., internal reports) that supports management's potentially unrealistic sales forecasts and discount any information (e.g., industry reports) that calls into question the reasonableness of management's assumptions.

Auditors cannot arrive at just any management-preferred conclusion as they are bound by reasonableness constraints (Kadous et al. 2003) – they cannot support accounting decisions that violate generally accepted accounting principles (GAAP). However, accounting standards do not always provide precise guidance on how to account for uncertain future events and conditions, such as the most appropriate method to estimate an amount to write-down inventory. Ambiguous guidance feeds into auditors' motivated reasoning – it offers auditors flexibility to interpret the guidance in such a way that they arrive at management-preferred conclusions (Hackenbrack and Nelson 1996). Hence, auditors can engage in goal-directed motivated reasoning while still maintaining a semblance of objectivity because a wide range of estimated amounts would be considered acceptable under the prevailing accounting standards.

### **Auditors' Motivating Reasoning and the Implemental Mindset**

The nature of auditors' motivated reasoning reflects what the theory of action phases would characterize as an implemental mindset (Gollwitzer 1990, 2012). Individuals adopt implemental mindsets when they are at the post-decisional action phase – when they are no longer actively deliberating the desirability and feasibility of the different alternatives or goals in their choice set. The implemental mindset facilitates task completion by focusing individuals' cognition on achieving a chosen goal. This focus on

task completion motivates individuals to, among other things, engage in selective information processing – seeking out information in support of the chosen goal and discounting information that does not support the goal.

Auditors who adopt a goal of supporting management's accounting decisions will quickly move from the pre-decisional to the post-decisional phase – in other words, from a deliberative mindset to an implemental mindset. While the implemental mindset helps individuals focus on efficiently acting on their chosen goal, auditors are required by professional standards to evaluate information impartially, to consider more than one perspective, and to seek out disconfirming information, all of which necessitate intense deliberation.<sup>1</sup>

Auditors' susceptibility to motivated reasoning raises the concern that they prematurely progress to the post-decisional phase arising from a tendency to default to the goal of supporting management's accounting decisions. Auditors are particularly likely to default to this goal when they have knowledge of management's accounting preferences before beginning their audit work (McDaniel and Kinney 1995).

When evaluating management's accounting estimates, auditors typically focus their audit work on the process management followed to develop the estimate, such as the data management used and the assumptions they made (Griffith et al. 2015a). Auditors' narrow focus on testing management's process creates the conditions for an implemental mindset to manifest because their choice set may contain only one accounting alternative – namely, management's. However, if auditors are prompted to develop independent expectations, then they expand their choice set and create the conditions for deliberation focused on the desirability and feasibility of

the alternatives to management's preferred accounting (Pike et al. 2013).

## Interventions to Stimulate a Deliberative Mindset

Auditors' tendency to focus their audit testing on evaluating the process management follows to develop their accounting estimates rather than on developing independent expectations promotes an implemental mindset that is not conducive to the skeptical mindset they are required to demonstrate as public accountants (Nolder and Kadous 2018). To address this concern, a deliberative mindset can be stimulated with interventions that encourage auditors to engage in critical thinking focused on an impartial analysis of the available information (Griffith et al. 2015b).

Auditors are required by professional standards to think critically about the quality of management's accounting decisions. However, even if such interventions prompt auditors to seek out more information about alternatives to management's preferred accounting, they will still arrive at management-preferred conclusions when they evaluate information through the lens of an implemental mindset. In fact, if auditors' implemental mindset focuses them on information that is consistent with their goal, then the outcome of prompting auditors to deliberate could be that they confidently conclude that the alternative preferred by management is the most appropriate (Kadous et al. 2003).

Another way to stimulate deliberation is to enhance auditors' accountability. For example, accounting firms that provide audit services to publicly traded companies in the USA are inspected by the Public Company Accounting Oversight Board (PCAOB) – an oversight authority that has the power to impose sanctions if the audit work performed is not in compliance with professional standards. The presence of a powerful audience could stimulate a deliberative mindset, but it could also motivate auditors to adopt a new goal – to perform audit work that would satisfy inspectors that the auditors challenged management's accounting preferences

<sup>1</sup> According to the auditing standards "The purpose of an audit is to enhance the degree of confidence of intended users in the financial statements" (CPA Canada 2010). Thus, when evaluating management's accounting decisions, auditors are bound by professional standards to consider not only the perspective of management but also that of users.

(Westermann et al. [Forthcoming](#)). In other words, accountability could prompt auditors to adopt an implemental mindset focused on information that disconfirms the appropriateness of management's preferred accounting.

## A Takeaway

Auditors are required by professional standards to be skeptical of management's accounting decisions but also to be impartial when planning and performing audit work. It is important to address concerns that auditors default to a goal of supporting management-preferred conclusions, but interventions that promote a goal of disconfirming the appropriateness of management's preferred accounting may simply serve to trade efficiency for effectiveness, resulting in higher quality but more costly audits. Hence, interventions that stimulate auditors to engage in intense deliberation likely work best, if practicable (McDaniel and Kinney 1995), in the pre-decisional phase, before auditors learn the preferences of the audiences to which they are accountable (Griffith et al. 2015b).

A long line of research has investigated whether auditors can satisfy their professional responsibilities (i.e., whether auditors can be independent) in an environment where they have incentives to maintain positive working relationships with management. This research shows that auditors' judgments are susceptible to bias even when they have every intention of making objective judgments. In fact, the mere knowledge that management prefers a particular accounting alternative is sufficient to activate a nonconscious goal in auditors' minds – one that impairs their ability to objectively evaluate management's accounting decisions. It is now well understood that auditors are not infallible and that their judgments are susceptible to cognitive bias. Researchers continue to investigate why auditors engage in goal-oriented motivated reasoning and how to mitigate its deleterious effects on ethical decision-making in auditing. This entry focuses on a relatively new approach to understanding auditors' goal-oriented motivated reasoning – one that investigates this

reasoning process through the lens of mindset theory (Griffith et al. 2015b, 2016).

## Impression Management and Business Ethics

Chris Provis

UniSA Business, University of South Australia, Adelaide, SA, Australia

## Synonyms

Self-presentation; Social performance

## Introduction

“Impression management” figures in business literature in a variety of contexts, from corporate reports through marketing to material on job interviews and staff recruitment. It raises ethical issues because it is a means of influencing people, either through giving them true or false impressions or in other ways. In management literature, “impression management” often refers to efforts from individuals or organizations to have people see them in a favorable light. In sociological literature derived from work by Erving Goffman, the term generally has a different sense, referring to individuals’ joint participation in a performance that conforms to a social script. However, there is some overlap between the sorts of ethical issues that arise in the two sorts of impression management.

## Conveying a Favorable Impression

With regard to efforts from individuals or organizations to have people see them in a favorable light, there is a distinction to be made between cases where this is achieved by getting people to see things in one way rather than another, where there is not an obviously true or false way of seeing them, and cases where it is achieved by conveying beliefs that are actually true or false.

It is important to note that in the latter sort of case, impression management is not always deceptive. It may just be publicly conveying accurate information (e.g., Leary 1995: 4). For example, a leader might offer evidence of past achievements to foster support. If the past achievements are real, then there is nothing deceptive about what is done. However, it is easy to find cases where impression management involves giving people impressions that are false. I might wear the tie of a particular school or college to convey the impression that I attended it. You might through your manner and bearing convey an impression of friendliness and sympathy, concealing a hostile intent. A company might through its branding and publicity imply

commitment to environmental causes, contrary to its actual processes and products. In each case, others could be caused to have false beliefs, through a process of suggestion or implication rather than through explicit statement.

When impression management does deliberately convey impressions known to be false, it often seems ethically problematic for all the same general sorts of reasons as outright lying. When someone deliberately gets another person to believe something false, there does not seem to be much ethical difference whether or not the means is an explicit statement.

However, there is one qualification that needs to be made. Sometimes, the person who gains the false impression may have to take some responsibility for doing so. If a company produces documents on recycled paper, giving you the impression that they are more generally responsive to environmental concerns, it may be your own responsibility as much as theirs that you have come to that conclusion. If you wear a tie that gives me the impression that you served with an elite army regiment, it may be my responsibility that I came to that conclusion without looking at the tie more closely.

This does not necessarily mean that the person or company that gives the impression is freed from responsibility or blame. Responsibility does not come in fixed amounts, so that one party’s responsibility necessarily diminishes the other party’s. We still need to consider the first party’s intentions and expectations: perhaps you relied on my laziness to impart that impression. However, it does mean that the situation can be more complex than that of outright lying and may need more careful scrutiny in particular cases.

## Impression Management and Ways of Seeing

In other cases, the issue of truth or falsity does not arise. Sometimes, we can see things in one way rather than another, without one way being true to the facts and the other untrue. Wittgenstein’s

famous “duck-rabbit” picture can be seen as either a duck or a rabbit, and neither way is more correct than the other. Impression management of this type is the sort of thing we do if we get someone to see a glass as being half-full rather than half-empty. An example might be leaders getting others to see them as firm rather than stubborn or as flexible rather than indecisive. Quite possibly, neither description is more factual than the other.

Despite the fact that neither description of a situation is more factual than another, accepting one rather than the other can still influence people’s behavior in significant ways. Similarly for many other such processes, such as giving accounts for actions: providing reasons or excuses for some action or outcome (Higgins and Snyder 1989; Rosenfeld et al. 1995, Chap. 4). Accounts and excuses often involve drawing people’s attention to new aspects of a situation and thereby getting them to frame it differently. There is no general reason to consider this problematic. Higgins and Snyder give an example where it seems quite proper, “the routine trotting out of safety statistics comparing airline and highway travel following air tragedies” (Higgins and Snyder 1989: 79). People’s inclinations to see focus on dangers of air travel may be allayed by the statistics. Such a process of impression management might be commended as encouraging people to “see things in perspective,” and the phrase would emphasize the framing aspect of the exercise. However, such processes are still liable to ethical evaluation and possible criticism in particular cases, on a whole variety of grounds.

## Varieties of Ethical Considerations

So far as relevant ethical considerations go, there are some that are most plainly relevant when impression management conveys true or false impressions. Most obviously, to give someone a misleading impression, inducing false beliefs, may lead them into decisions that have bad consequences for them or others. Investors may be harmed by giving them the impression that an

investment is safer than it really is, for example. But other considerations are also relevant.

We often use various other ethical criteria to evaluate communications, apart from their veracity. My words can wound you, your letter can make me anxious or worried, a company’s announcement can panic investors, and in each case there may be an ethical problem, whatever the truth of the matter. Respect and compassion, sensitivity and wisdom, and many other qualities are relevant to ethical evaluation of communications and can often apply where we are getting people to see things one way rather than another, even if there are no applicable criteria of truth or falsity.

In particular, fairness and respect can be especially important considerations. There are other ways of leading people into poor decisions besides directly inducing false beliefs, and so doing may not only do them harm, but it can be unfair and show clear lack of respect for them as decision-makers. Impression management may impair people’s ability to make good decisions by triggering psychological mechanisms that run counter to balanced deliberation. One quite common example is to summon ingroup bias. In applying for a job, someone might wear a lapel pin of a society to remind interviewers of their own membership of the same society. There may be no genuine relevance of the membership, but it might influence interviewers even so. It is common for people to use speech to activate ingroup-outgroup dynamics, as they use accents, terms, and phrasing to exhibit membership of one group rather than another. Ingroup bias is a very well-known phenomenon and can certainly draw us into problematic decisions.

## Impression Management as Social Performance

That sort of impression management starts to become the sort of impression management that Goffman considers in detail in a variety of contexts. Goffman emphasizes the social performances in which two or more people follow

some established script to produce a shared public impression. These collaborative social performances are everywhere in social life. Very often, we have some understanding of people's shared expectations in a particular social context and together act on that basis. If we act contrary to shared expectations, we shatter the impression of consensus and mutual understanding (Goffman 1971). Our impression management can sometimes be to show membership of a particular ingroup, by emphasizing aspects of our speech or dress, for example, which then may be reciprocated by others. More generally, however, one person can initiate a social script which expects a complementary response by another. Offering an outstretched hand invites another person to do the same, to complete the social ritual of shaking hands. Declining the first person's hand is awkward and embarrassing. There is substantial pressure in favor of the complementary response. Such processes can be used to influence others in ways that unfairly disadvantage them, ranging from cases that are on the borderline of ethical sales techniques to outright confidence trickery.

Fairness seems to be a major consideration in many such cases, alongside possible harm and lack of respect (Schlenker 1980). It can figure in all sorts of impression management. In cases where one party gives a deceptive impression to another, there is an unfair imbalance of information and awareness. In those cases also, but equally in cases where one party gets another to see things in one way rather than another, the other party can be influenced toward decisions that unfairly advantage the first. Similarly in these cases where individuals experience social pressure toward a particular action.

However, in these cases of social impression management, fairness can be prominent in another way as well. Satisfactory participation in a social performance can demand resources that are more readily available to some people than others. Employment interviews are one sort of example. Often, in an employment interview, individuals are expected to show appearance and demeanor that conform to certain expectations. In doing so, they demonstrate an awareness of the expectations that their potential employer

may have of them, together with willingness and ability to conform to those expectations. But to show that appearance and demeanor requires a whole range of resources. These include straightforward material resources, such as appropriate clothing. For people on limited incomes – as currently unemployed people well may be – an expectation to wear upmarket clothing may be difficult to meet, and they are unfairly disadvantaged. The resources needed may also be experience of the social environment that people with better-off backgrounds may be more likely to have.

## Incivility in the Workplace: A Call for an Ethical Analysis Approach

Peggy Cunningham<sup>1</sup> and Minette E. Drumwright<sup>2</sup>

<sup>1</sup>Dalhousie University, Halifax, NS, Canada

<sup>2</sup>University of Texas at Austin, Austin, TX, USA

## Synonyms

Uncivil conduct; Workplace ethics

## Introduction

Incivility in the workplace is an almost universal phenomenon that is prevalent in all sectors of the economy. It occurs in all types of workplaces. Some professions seem especially ripe for incivility: medicine and nursing, journalism, universities, and the military, to name a few (Vasconcelos 2020). While the presence and impact of incivility have been studied in multiple geographies, the United States remains the region most investigated (Vasconcelos 2020). Incivility is estimated to affect 98% of employees, 50% of whom have experienced incivility on a weekly basis, and the monetary cost of incivility to organizations is estimated to be \$14,000 per employee per year (Schilpzand et al. 2016).

## A Brief History of Incivility Research

Academic attention to incivility was initiated just over 20 years ago by Andersson and Pearson (1999). They defined it as low-intensity, deviant workplace behavior in violation of the norms of respect and basic moral standards, and they noted that it was characterized by an ambiguous intent to harm. Behaviors described as uncivil include acting rudely or discourteously, belittling, interrupting, or ignoring others, making rude jokes, or spreading rumors and gossip verbally, via e-mail, or through social media (Akella and Lewis 2019). Incivility, a form of microaggression, is often intertwined with other types of inappropriate workplace conduct such as bullying, ridicule, work sabotage, physical threats, vandalism, slander, and ostracism (Berdahl and Raver 2011).

In their comprehensive literature review, Schilpzand et al. (2016) stressed that incivility has been differentiated from other forms of mistreatment because the actions and outcomes related to incivility are viewed as less severe, the intent is ambiguous and hard to detect, and it may be enacted by managers, coworkers, or external stakeholders such as customers. These authors noted that while incivility was initially conceptualized as an escalating spiral of behavior that occurred within dyads of employees who work

closely together within an organization, there has been little empirical evidence that the severity of the behavior increases or escalates over time.

Schilpzand et al. (2016) organized the literature into three categories based on the actor (s) involved: (1) those who experienced incivility (e.g., studies of the impact of incivility on victims), (2) those who witnessed incivility (e.g., the impact of incivility on people who see or hear about incivility such as bystanders), and (3) those who instigated incivility (e.g., the actions initiated by perpetrators of incivility). They drew attention to the fact that the majority of the extant research has examined experienced incivility (82%), followed by studies of instigated incivility (14.5%), and studies of witnessed incivility (7.5%). The paucity of research on witnessed incivility and a call for research in this area were also emphasized in a recent special issue of the *Organization Management Journal* (Akella and Lewis 2019).

Despite its low intensity, incivility harms both employees and their organizations in significant ways. Negative outcomes experienced by employees include lower satisfaction with work, supervision, coworkers, and the job in general; reduced organizational commitment; declines in a sense of distributive justice; poorer psychological well-being (e.g., posttraumatic stress symptoms and panic attacks); higher levels of anxiety and depression; declines in physical health (e.g., headaches, disrupted eating habits); early retirement; and lower morale (Cortina et al. 2001). Victims of incivility are more often women and minority groups (e.g., Taylor and Pattie 2014), which provides evidence of discrimination. Organizational harm arising from incivility includes the creation of unpleasant office environments, increases in aggression and retaliation against the organization, greater absenteeism, and heightened intention to leave the organization. These negative outcomes, in turn, impact company performance and profitability, reputation, and image (Akella and Lewis 2019).

Despite the presence of a growing body of work, research on incivility to date is fragmented. It has used overlapping, poorly defined constructs (Herscovis 2011), and it lacks an overarching

theory to help researchers and practitioners alike understand and take action against it (Schilpzand et al. 2016).

### **A Paucity of Incivility Research Using Ethical Lenses**

Despite the fact that incivility has been defined as a failure of moral standards that violate norms of respect, surprising little research on incivility has used ethical lenses to understand the causes of incivility, important moderators or mediators that increase or decrease it, or the consequences of it such as degradation of organizational climate, organizational trust, or organizational pride. One exception is research on ethical leadership that suggests that leaders who model appropriate conduct in their relationships with others can create and foster positive norms of respect that reduce incivility (Taylor and Pattie 2014).

The paucity of research applying concepts from the ethics literature to the topic of incivility presents a major research opportunity that may provide insights into why incivility is a persistent and pervasive problem. Such research could enhance the sparse literature on why people act in uncivil ways and the impact of incivility on those who witness it or are victims of it. Application of ethical lenses also may promote more civil workplace behaviors among various parties since professionalism in the workplace is founded on an understanding of ethical conduct. In addition, ethical analyses may provide a much-needed theoretical underpinning for understanding incivility and integrating the variables associated with it into valid explanatory models that will better explain this detrimental workplace behavior.

### **Promising Ethical Lenses**

Surprisingly, a fundamental question has yet to be addressed in the extant literature – is incivility an unethical behavior? The three major normative ethical theories – deontology, teleology, and virtue ethics – can be used to address this question.

Because of shortcomings in each normative theory, some ethicists believe that an analysis of behavior must account for both deontological and teleological aspects when evaluating alternatives or actions, while others stress that assessments of behavior must deploy all three approaches. Using the three-pronged approach, deontological theory demands that the inherent rightness of the behavior be examined. This would require an evaluation of incivility based upon principles, duties, rights, rules, and norms. Incivility, for example, violates the principle of beneficence and results in harm to victims, witnesses, and their organizations. Thus, it would be classified as unethical behavior. The duty of respect is also violated by those behaving in an uncivil manner. Respect is based on an understanding of the moral value of all humans as an end and never merely as a means (human dignity formulation). Uncivil behavior violates human dignity, and it treats individuals as a means to meet someone else's agenda rather than as an end in themselves. If an assessment of human rights is deployed as the standard, incivility would also be condemned since people have a right to work in an equitable, respectful, and safe environment free of incivility. They have the right to be heard when they object to incivility and the right to redress if they are subjected to it. The concept of the Golden Rule, another deontological approach present in virtually every world religion, argues that people should treat others in the manner that they would like to be treated. Few people would want to be subjected to uncivil behavior.

Teleologists examine the consequences of potential actions and see the most ethical course of action as the one that produces the greater balance of good over evil. While there is debate as to whose "good" is to be promoted, one form of teleological theory, utilitarianism, requires that the aim of any behavior should be the creation of the greatest good for the greatest number of people. Furthermore, utilitarian approaches see actions that promote happiness and well-being as right, and those that promote unhappiness or harm as wrong. Since uncivil actions involve discrimination, a form of harm, and since it increases

unhappiness, incivility would clearly be viewed as wrong or unethical. Virtue ethics, the third major normative approach, emphasizes moral character when assessing behaviors. It asserts that decision makers should habitually practice virtues such as respect, fairness, and justice irrespective of the outcomes. Certainly, an individual behaving uncivilly does not exhibit these virtues so he/she would be labeled unethical.

Since normative ethical analysis condemns incivility, research could be conducted to test if a better understanding of the normative ethical approaches that incivility violates would help leaders and followers alike better detect incivility, recognize the harm it causes, increase reporting and take action to halt it. Research could also be undertaken to test the power of better educating both employees and managers about their rights and ethical obligations in the workplace. This type of education may be a helpful tool in motivating workers to detect and ultimately reduce incivility. More generally, such studies may provide stronger frameworks for leaders to develop workplace and professional codes of ethics prohibiting uncivil behavior.

Carol Gilligan's ethics of care (1993) may be an alternative, fruitful approach to providing more insight into the causes and effects of incivility. Gilligan noted that people experience themselves in relation to others and that the origins of morality lie in human relationships since they give rise to concerns about injustice and carelessness. Stressing that humans are hardwired for cooperation, she argued that instead of asking questions about how people gain the capacity to care, a more important and interesting question was how people lose the capacity for empathy, understanding, and care. Acts of incivility clearly lack these characteristics, and research to unveil how people lose the ability to care could help counteract incivility.

Using network theory and behavioral ethics research to better understand workplace relationships and decision-making, Drumwright and Cunningham (2020) provided some initial insights into why people lose the ability to care and behave uncivilly. In particular, they studied persistent unethical behavior in newsrooms and found that perpetrators of uncivil behavior were able to

persist in their bad behavior because they formed "networks of complicity" that protected them from sanction. Perpetrators were excellent networkers inside and outside their organizations. They used benefits, perks, and rewards – and sometimes fear and intimidation – to draw people to their networks and maintain their loyalty. Ultimately, the importance of maintaining relationships with the perpetrator of incivility and others in the network of complicity trumped network of complicity members' concerns about uncivil behavior and its effects on others.

Drumwright and Cunningham (2020) also found that this lack of caring was aided and abetted by behavioral ethics factors. Behavioral ethics posits that most decisions are made instinctively, not rationally, and that cognitive errors, social and organizational pressures, and situational factors often undermine ethical decision making in subtle ways. For example, members of the network of complicity fell prey to the social pressures related to the conformity bias – for example, the assumption that incivility was acceptable because everybody was doing it. Likewise, they succumbed to the obedience to authority bias – for example, incivility was justified because their superiors or others with power were not intervening to stop it. Network of complicity members also suffered from the framing bias – a cognitive error – when they perceived incivility as harmless or even a necessary rite of passage. As such, incivility was normalized despite the fact that it contributed to, and perpetuated, a toxic organizational culture that was absent of empathy and care.

Paradoxically, Drumwright and Cunningham (2020) also found that uncivil workplace behavior, which was supported by networks of complicity and behavioral ethics factors, persisted even among journalists who closely adhered to codes of ethical journalism in creating content. In other words, even individuals who were morally sensitive to some ethical issues suffered from moral blindness with respect to incivility. As such they lost their ability to care about others who were subjected to unethical behavior. Further research is needed to better understand how and why such paradoxes arise. Questions need to be asked about whether this finding is generalizable to other

workplaces, and if so, what moral logics, philosophies, or approaches are most likely to cause these paradoxes. In other words, questions need to be investigated about how people with high ethical standards related to one aspect of work can support unethical behavior in other aspects of their workplace relationships.

The extant research has suggested that unethical behavior often arises because of unprincipled uses of power by supervisors and organizational leaders. While incivility can occur among all levels of employees, not just managers and leaders, Drumwright and Cunningham (2020) also found that perpetrators of incivility had various forms of power (e.g., coercive, charismatic, informational, legitimate, relational, and reward power). They used their power in self-serving, inappropriate ways to form and maintain their networks of complicity and to abuse employees through their uncivil behaviors. This research could be extended in two ways: (1) investigations of how misuse of different types of power affect occurrences of incivility, and (2) how misuse of various types of power impacts organizational culture and climate. Such research would further the understanding of the prevalence, persistence, and impact of incivility on employees and organizations.

Not only must leaders, managers, and workers understand the problematic nature of uncivil behavior, they must be enabled, motivated, and empowered to take steps to halt it in their organizations. There is some evidence that training can help leaders and followers alike learn to identify uncivil workplace behaviors, give voice to their values, and prepare themselves to intervene in effective and ethical ways when they encounter uncivil behavior; however, much more needs to be learned. Given that incivility lacks a clear intent to harm, questions need to be asked about whether there are other organizational cues that employees and leaders can use to help them detect incivility and act to stop it within the workplace.

Incivility, by definition, may initially appear less harmful than other forms of unethical conduct, and for that reason, it often has been under the radar. Since incivility is more subtle in nature

than other types of unethical conduct, rates of reporting likely are much lower than for other forms of unethical behavior. Moreover, even when there are complaints of incivility, organizational units, such as legal or human resource (HR) departments, may be less likely to take them seriously or to act to enforce policies. Everyone within work organizations must understand the harm that incivility causes. Only then will organizational leaders and managers within HR and legal departments make the changes to policies, procedures, training, and organizational climate and culture needed to deter uncivil behavior. Likewise, because of its low intensity and its ambiguous intent, incivility has not received the research attention that it deserves from ethics scholars. Much remains to be learned in terms of how to ensure that workplaces are civil, safe, equitable, and just.

## Inclusivity Management Research: Persons with Disabilities and Self-Employment Activity as an Exemplar

Benson Honig  
McMaster University, Hamilton, ON, Canada

### Synonyms

Entrepreneurship; Equity and access; Persons with disability; Self-employment

### Introduction

Persons with disabilities (PWDs) are increasingly recognized for their potential economic and social integration worldwide. Estimates suggest 14% of the OECD population has a disability (Honig 2021). This figure is expected to grow along with aging populations, highlighting the important nature of this challenge. It also presents an opportunity, considering the social, health, and economic benefits that accrue to individuals actively engaged in economic activity. Historically, society's view of the disability

rights has changed radically in the past 30 years, from a marginalized population under threat of institutionalization and forced sterilization, to a growing disability rights movement that continues to advocate for de-institutionalization and for guaranteed equal employment opportunities (Youtube 2021).

Issues of discrimination or “abelism” including eugenics and forced sterilization policies provide a troubling historical background of marginalization (Ronen et al. 2009). Historically, considerable effort has been extended toward vocational education, typically trapping or funneling PWDs into limited careers that are deemed “acceptable,” but otherwise lack opportunity (Boman et al. 2015). Entrepreneurship is an increasingly important opportunity for PWDs to gain economic independence, develop self-efficacy, political and social voice, and enjoy career opportunities previously denied to them due to abelism (Martin and Honig 2019).

### Entrepreneurship and Persons with Disabilities

Recognizing the rights of persons with disabilities (PWDs) has come a long way in recent years. The UN's sustainable development goals and the rights of citizens with disabilities in numerous countries have been codified to ensure full and effective participation on an equal basis. The Americans for Disabilities Act, signed in 1990, became an important global model for revising existing stereotypes and enhancing rights and opportunities. Outcomes worldwide include well-designed programs that encourage self-employment and entrepreneurship for PWDs, can be economically sustainable, and provide positive outcomes to economic and psychological health (Halabisky 2014).

The COVID-19 pandemic of 2020–2021 served to highlight many opportunities for PWDs by shifting much work from the office to the home, a factor of significance for PWDs that have mobility issues or require targeted devices to ensure accessibility. As society opens up to these growing home-based work opportunities, self-employment for PWDs is likely to accelerate. Assistive technologies have increased in

capabilities and decreased in cost, allowing better Internet access for various PWDs (e.g., overcoming sight and auditory constraints (Halabisky 2014)). Efforts documented by members of the OECD, for example, show a vast and increasing array of programs and support for PWD entrepreneurship (Martin and Honig 2019; Honig 2021; OECD/European Commission 2021). Unfortunately, support workers, career guidance counselors, occupational technologists, and employment officers are frequently unprepared for supporting PWDs in advancing entrepreneurship and may be ill prepared to advise clients on this innovative career trajectory. Existing institutional norms do not necessarily support active PWD integration (De Clercq and Honig 2011). Thus, there is a need for greater research, training, mobilization, and effective role models in order to open up opportunities for more PWDs in entrepreneurship in the disability and work placement arena.

As well, there is a need for specialized targeted training and research that enhances programs and supports incubators and entrepreneurship advisors engaged in helping PWDs (Halabisky 2014). One opportunity for supporting PWDs in entrepreneurship consists of entrepreneurial incubators. These are dedicated institutions designed to encourage collaboration, share meeting spaces and office, and provide training, exposure, capital, and mentoring services, as well as marketing and general public awareness. Incubators have traditionally avoided PWDs, focusing instead on early stage businesses with high potential. However, opportunities are growing, particularly with innovative support designed for PWDs. For example, a recently launched “virtual incubator” ([www.reframery.org](http://www.reframery.org)) obtained funds to begin work with targeted PWD entrepreneurs.

Public policy should provide incentives for PWD entrepreneurship. Unfortunately, many contemporary policies discourage such activity by, for example, clawing back financial and institutional support for PWDs that engage in early stage entrepreneurship, and by presenting obstacles for individuals whose entrepreneurial efforts fail to return to pre-start-up support, including clawbacks from other support programs (Halabisky 2014). This is unfortunate, as

entrepreneurship is based on learning from failure; indeed failure is an important aspect of entrepreneurial trajectories and should be both accounted for and integrated into promotion efforts. Other important aspects of support include developing appropriate financial and mentoring activities within a local entrepreneurial ecosystem (Samila and Sorenson 2017). Targeted loan programs may offer opportunities that are otherwise closed off to PWDs in usual banking channels due to ableism and other biases and constraints.

Research has highlighted the importance of developing social capital for entrepreneurs (Davidsson and Honig 2003), a factor of particular significance for PWDs. Research regarding how best to develop PWD entrepreneurial social capital is still in its infancy. It was found that PWDs faced numerous barriers compared to the nondisabled and had lower incomes, smaller startup investments, and smaller teams (Renko et al. 2016). Other early findings suggest that even engaging in nascent gestation behaviors (e.g., writing plans, developing prototypes, and meeting potential customers) offers important psychological benefits, not necessarily aligned with the success or failure of the actual emergent enterprise (Martin and Honig 2019). It should be noted that PWD entrepreneurship may take longer to initiate due to the complications in obtaining required support tools and possibly reduced time invested during the startup phase due to physical limitations. Notably, this research suggests that returns to investment in PWD entrepreneurship need to go beyond a focus on the economic returns from commercial activities, to include health expenditures, wellness evaluations, and quality of life considerations. Thus, careful assessment and program development should evaluate the various contingent factors that impact the dynamic environment of entrepreneurship for PWDs. Longitudinal research examining health and psychological benefits are required, in addition to the economic assessments typically applied to program evaluation.

The field of PWD entrepreneurship is still in its infancy; however, global attention has begun to focus on both the necessity and the opportunity to

improve the quality of life of PWDs facilitating their economic and social integration.

Ethics; Interdependence; Management education; Self; Stakeholder; Values; Wisdom

## Introduction

With accelerating and unpredictable change in every aspect of life and work in our new millennium, business leaders are compelled to grapple with uncertainty and paradoxes. It is time to take a deep look at some of the fundamental principles and dominant assumptions of management thinking and practices and redefine the roles and competencies of future leaders starting with their ability to address some unsettling questions. The whole notion of ethics and the understanding of values and culture need to be revisited in a spirit of inclusiveness and integration amidst

myriads of diversity. This calls for transition from the dominant obsession with techno-economic imperatives towards expanding perspectives that include social, ecological, and humanistic issues within our domain of concern. At a microlevel, it also marks a transition from our limited notion of the self as an economic entity to a deeper understanding of our true human identity and viewing ourselves deeply interconnected in an organic relationship with others in space and time. Learning to live with uneasy questions that challenge the conventional mental models and stereotypes and finally embarking upon an adventurous odyssey into search for the real answers are the characteristics of this unsettling transition. The journey that begins with search for light from new horizons also demands a transformation of the mind-space from a mad, “brave new world” of speed, information, and numbers towards a sustainable earth with a passion for excellence, commitment to quality, concern for harmony in relationships, a quest for enduring values and ethics, and an earnest seeking for wisdom.

### Embracing the Challenges

In his famous poem, “The Rock,” T S Eliot had lamented:

“Where is life we have lost in living?  
 “Where is wisdom we have lost in knowledge?  
 Where is knowledge we have lost in  
 information?”

Future business leaders must be ready to venture into a learning odyssey – from information through knowledge to wisdom for the sustenance and well-being of humanity and planet at large. Powerful insights from the millennia old classical wisdom literature of India may throw light on new and unconventional sources of learning like stories and parables, lessons from nature, learning from insightful and engaging conversations, and also learning through immersion in silence and solitude. Relevant inputs from great masters in the west need to be shared in the right context to make this journey truly global. It is also important to explore the art of asking questions that break

the barriers of linear thinking and binary logic in our thoughts, perception, and communication. It helps us to re-examine life afresh, anew.

Millennia ago, Socrates had remarked: “An unexamined life is not worth living.”

### Emerging Ethical Imperatives for Business in India and World

As the world is marching ahead at an incredible speed towards economic progress through technological development, the socio-economic and the cultural fabric in the global landscape as well as the Indian milieu is also increasingly showing ominous signs of rupture because of mega-instances of decline of values resulting from ethical violations and breach of trust at all levels of our life-world – from family to society, from government to the business, covering all areas of human endeavor. Shocking news of large-scale corporate scandals have hit the headlines across the globe over the last few decades. Cases of mega-scams amounting to multi-million dollars like Enron and WorldCom in the West or “Parmalat globally or PMC Bank scam,” “DHFL scam,” “IMA ponzi scheme,” 2G Scam, Coal Scam, and of course Satyam in India have shaken up conscientious individuals who are questioning the very foundations of management education and corporate training world over.

All this signals an urgent need for a radical paradigm shift of business and management, questioning the sole motive of business to make profits and provide returns to its owners or shareholders as a practice that has become outdated and dysfunctional at a time when stakeholder engagement and inclusive growth are increasingly assuming vital significance for long term survival and sustainable growth of business. Be it from legal or socio-economic considerations, corporate organizations have been mandated with the imperative of performing business activities with high priorities on ethical sensitivity, social responsibility, and environmental consciousness leading to responsible and enlightened governance.

## Changing Face of Business Education in India

Thus, all stakeholders are called upon to pay serious attention towards the interdependence between business and society for all-round socio-economic development with a human face. This has significant implications for business and management education that will shape the mindsets, develop the perspectives, and enlighten the perception as well as vision of the students and business executives to understand the symbiotic relationship between business and society, ethics and governance, environment and management, and engage in responsible decisions and action. Business ethics as a subject in business schools and institutes of management has assumed critical importance worldwide and has also been highlighted as an integral part of corporate training and executive education modules since the last few decades. The academic and business scenario in India is no exception. Across business schools, institutes of management, and corporate entities, the importance of imparting value-based education has been emphasized and considered to be essential for conducting ethical business practices. The prime objective of management education is to enable the future leaders to learn to choose the right over the wrong and make ethically enlightened as well as effective decisions in their personal and professional life for individual and collective well-being and holistic development (Arlow 1991; Rest 1988; Schlaefli et al. 1985).

The evolution of Corporate Social Responsibility (CSR) and Environment, Society and Governance (ESG) both as enlightened management philosophies and responsible practices are significant developments in this direction. The students are thus empowered with the philosophical inspiration and simultaneously equipped with the requisite functional tools for recognizing and responding to ethical issues. This has also resulted in changes in pedagogical process from one-way classroom lectures to engaging the students in dialogues to develop multiple perspectives of a business situation through analyses of both positive and negative cases of business conduct. The

goal of education is presently undergoing a much-desired change from churning out employable graduates to developing future leaders charged with a noble mission, enlightened with a holistic vision and guided by enduring values for all round and humanistic development of the self and the organization, society, and the planet.

## Effectiveness of Ethics Education in Management: Research Findings and Future Directions

At this point, it may be pertinent to highlight the summary of findings of a recent study on effectiveness of ethics education in the context of management education in India (Mukherjee and Ghosh 2022):

- (a) There is a need to enrich the existing curriculum by incorporating inputs on meaning of work and purpose of life to broaden the perspectives of students so that they can develop a big picture awareness of life and work. Insights from Indian classical wisdom will be of immense value in this regard.
- (b) It is essential to provide a strong foundation of human values and ethics at a conceptual level from deeper spiritual perspectives.
- (c) The need of the hour is to achieve the integration of spirituality into management for enriching and enlivening a rather “dry and dreary” purely academic endeavor with spiritual wisdom and insights from great Indian spiritual leaders like Swami Vivekananda for expansion of leadership consciousness beyond narrow, short-term oriented self-interest.
- (d) Finally, it is vitally important to generate and sustain the interests of students in courses on values, ethics, and spirituality by introduction of self-development methods like meditation for a more humane approach to life and business.

Time has come when scholars, researchers, and practitioners in management are called upon to give serious attention towards reinventing design

and delivery of courses on business ethics and values education in management. Pertinent insights from classical Indian wisdom have the potential to give an authentic and inspirational foundation to the pursuit of the discipline of ethics and values in business by addressing deeper issues and questions on meaning of work, purpose of life, and notion of Self. This can give a radical turn to our conventional and stereotyped notions of “success” and “failure,” “progress” and “development” and help re-shape the mindsets of millions of students to deal with uncertainty and complexity in business and overcome the barriers to holistic and sustainable development of the individual and the organizations. It has also the power to liberate the outdated existing pedagogical process from its mere intellectual discursive methods that only stimulate the brain but do not inspire the students from within (from the depth of their heart) to engage spontaneously in enlightened ethical decisions and actions.

The notion of Spirituality as presented in this chapter is an ever expanding and continuously evolving movement of human consciousness that begins from the core of the being of the individual and reaches out to include, accommodate, and engulf the organization, society, nations, and the planet at large even including the cosmos.

### **Teaching Business Ethics in India: Problems and Prospects**

Engagement in Values and Ethics education in India at the level of the premier institutes of Management (Indian Institutes of Management, the IIMs, XLRI, MDI, IMT, SPJIMR, NMIMS, etc.) about three decades helps identify some of the major pitfalls in ethics education in management. It has been observed that there is general lack of interest among the students in such courses as they have no tangible linkage to their career advancement. But this also presents a formidable challenge to the faculty instructors as it calls for devising and designing novel and creative ways to make the pedagogical inputs lively, vibrant, and practically relevant. To make the pedagogical process a creative engagement, the development and

delivery of these courses needs to encourage the culture and practice of raising deeper, critical, and often uneasy questions. This transforms the learning experience to a veritable adventure that helps students connect the inputs with purpose of life and meaning of work and transcend the limits of linear thinking and binary logic towards holistic perception of the self, organization, and society and the planet at large. That is why the concept of the Self as propounded by the age-old holistic philosophical systems of the East, especially India, becomes vitally important to the discourse on values, ethics, and sustainability in business and management.

All this calls for academic, both intellectual and intuitive, exploration of the tenets and methods of Indian spiritual wisdom as embedded in Philosophy of the Upanishads and other age-old, authentic sources. The notion of Self as Pure Consciousness (“*Poorna*”) as well as the distinction between the deficit-driven lower self that is ever craving and the surplus-inspired Higher Self that is ever giving has been the foundation of Concept of Self as promulgated in the Upanishads or the Vedanta. Moreover, the conceptual framework of “*Purushartha*” or fourfold values or goals strikes a balance of material and spiritual pursuits in life and work. This provides us not only a strong foundation to the prime driving force, impetus, or motive of our decisions and actions, individual as well as organizational, but also offers a new and radically different way of looking at reality of our life-world including business and deal with it in a manner that is ethical and responsible, creative and sustainable, and also functionally effective.

### **Towards an Alternative Worldview of Business and Management Education**

Over the last few decades, one has witnessed growing disenchantment among conscientious thinkers and practitioners with the dominant paradigm of mainstream management based on capitalism and industrial mono-culture. In the arena of management education, there has been the rise of strong critique of our existing methods of learning and an intense search of “other” or alternative

models of knowledge creation and dissemination. None less than the eminent stalwarts in this field have raised this powerful voice to challenge the proponents of the mainstream (Ghoshal 2005; Bennis and O'Toole 2005). In a system dominated by binary logic and linear thinking, there has also been a search for an alternative holistic paradigm of organic connectivity so that our head and the heart do not split knowledge into dualities of thought and being, body and mind, intellect and emotion but drawing upon lessons from nature and vibrantly resonate with the spirit of wholeness that engages every part of our being.

In their book, *Business within Limits*, Ims and Zsolnai (2006) present to us a humanistic world-view rooted in Deep Ecology and Buddhist Economics. Michael Ray (1992) made a radical departure from the dominant world-view by proposing an alternative paradigm where he advocated that vision must replace profit as the main aim of business. Chakraborty (1995), the pioneer of the movement of human values and ethics in management education in India, identified the main pillars of wholesome business transformation in his concept of "Business Ashram" based on the cardinal principles of Indian philosophy, culture, and ethos. Mukherjee (2007) has highlighted the need to explore alternative sources and methods of learning for holistic and integral development of the individual in organization. The imperative to develop a "quality mind" (Chakraborty 1995; Chakraborty and Chakraborty 2006) or "quality consciousness" (Chatterjee 1998, 2003, 2006) has been made abundantly clear by these enlightened thinkers and academics to build value-driven business organizations and create a sustainable society and planet for future generations.

The notion of Spirituality at Work (SAW) has generated keen interest as evident from the rising number of publications on Spirituality and Holistic Management (Biberman et al. 1999; Bell and Taylor 2004; Cash and Grey 2000; Mitroff and Denton 1999, Pruzan et al. 2007 etc.). The concepts of Synchronicity (Jaworski 1998) and Spiritual Intelligence or SQ (Zohar and Marshall 2000) are also significant developments in this direction.

## Why Indian View of Business Ethics?

Corporate senior management, management consultants, renowned economists, educators, etc., are still not able to find a concrete solution for coping up with this increasing uncertainty in the global business scenario. They are still trying the old way of "control, control, control" and "justify, justify, justify" which has hardly come of any substantive use. It is only leading this world to more "selfishness" in the international relations where disparity, both in economic and social terms, between the nations is increasing.

All this leads us to ask some critical questions:

"Are the existing models of modern management capable enough to cope up with this current global management crisis? Are the existing modern management practices enough to bring back sustainability in the global economy?"

The answer to the above questions lies in integrating ancient wisdom in the existing modern management frameworks. The ancient Indian wisdom which has a heritage of more than 3500 years old and which teaches something more "eternal" and timeless could be a guiding light for bringing more certainty and sustainability in our business practices.

The ancient Indian wisdom is extremely rich and contains hundreds of different scriptures based on the teachings of innumerable sages and philosophers, more unknown than known. Table 1 below lists down those scriptures and the most important idea that they contribute to the thought business ethics from an Indian perspective (adapted from Bhattacharjee 2011).

## Managing the Self – Drucker and the Indian Way

Peter Drucker, in his seminal article "Managing Oneself" which appeared in Harvard Business Review in the year 2005, wrote that every knowledge worker in contemporary organizations should learn to manage themselves by asking "Who am I?" "What are my strengths?" or "Where do I belong?" According to the great sage Patanjali, one of the afflictions of human

**Indian and Business Ethics, Table 1** Salient contribution of five most relevant scriptures in the context of management

| Period         | Scripture                | Description                                                                                                                                                                                             | Most important idea                                                                                                                                                                   |
|----------------|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1500–1000 BC   | Vedas                    | Oldest scriptures of India. It consists of four canonical collections or <i>Samhitas</i> viz., Rig, Yajur, Sama, and Atharva                                                                            | The Truth is One but only expressed in different ways by different sages                                                                                                              |
| 1000–600 BC    | Upanishads               | Philosophical texts considered to be an early source of Hinduism. Consists of more than 200 texts                                                                                                       | The grand interconnectedness between living and nonliving. Individual consciousness is no different from the universal consciousness (ref. Radhakrishnan 1953)                        |
| 200 BC–200 AD  | Bhagavad Gita            | An eternal song in the form of a poem which reveals important lessons on ethics through a dialogue between Lord Krishna and the warrior Arjuna who is in the midst of a major dilemma of his life       | Desire-less action is superior to work with selfish desire; Salvation attained through work is superior to that attained through renunciation of work, etc. (ref. Radhakrishnan 1994) |
| 100 BCE–500 AD | Patanjali Yoga aphorisms | Consists of 196 aphorisms showing a way of personal discipline for integrating the mind, body, and soul.                                                                                                | Ignorance and ego as the afflictions of human mind (ref. Brahmachari 2003)                                                                                                            |
| 249 BCE–100 AD | Arthashastra             | An ancient Indian treatise on statecraft and economic policy written by Kautilya who was later identified as Chanakya, the mentor-advisor ( <i>Acharya</i> ) of the first Maurya emperor, Chandragupta. | A king (or leader) should be a <i>Rajarshi</i> (a king who is wise like a sage) (ref. Rangarajan 1992; Singh 2016)                                                                    |

mind is ignorance (*Avidya*). Ignorance is a state of self-forgetfulness that is born of our naturally distorted, material perception. In ignorance, people see and accept the unreal as real and the real as unreal. One's perception of the physical starts overriding their awareness of the subtler, spiritual dimensions of existence, and consciousness. Individuals forget who they essentially are. They forget that they are a spiritual being living in a human body to have a human experience (Brahmachari 2003).

It is through practice and spiritual discipline that one can attain practical wisdom. Knowledge is created and acquired in the process and one realizes that the true individual Self (Atman) as an integral part and reflection of the Cosmic Self (Brahman). As Radhakrishnan (1953) said in his commentary on the Upanishads: "Atman is the principle of the individual consciousness... Brahman the first principle of the universe, is also known through the Atman, the inner self of the man."

Ancient Indian sage Patanjali in his famous treatise, the *Yoga Sutra*, said that ego (*asmita*) is the second affliction of human mind which has its foundation in ignorance (Sharma 2013). Some of the words which were associated with the most successful and revered companies are talent, excellence, power, consistently exceeding customer expectations (satisfying their needs), etc. But when the same companies fail miserably, management consultants, experts, and senior management people start giving a lot of economic reasons for their downfall. But what might have gone wrong in these organizational failures cannot be just traced to economic reasons or financial parameters, but it could have been wrong management decisions based on greed, lust, exploitation, rivalry, pride, or vanity, etc. Ego acts like a screen which blinds even the most knowledgeable and intellectual person and makes him take the wrong decision. Making a wrong and unethical decision is basically an intellectual failure. Mind creates the decision alternatives, but it is our

intellect which decides which one to choose. It is only by anchoring to one's Self that the negative effects of ego can be overcome.

Plato declared that only philosophers were fit to rule. So, it can be seen that only by managing the Self and acknowledging the interconnectedness through knowledge transfer and knowledge sharing, that one can be liberated from the spell of ignorance and thus overcome the desires of their senses and work for the higher cause (which in our case should be the organizational mission). In this way, one can maintain ethical leadership to steer themselves through the highly uncertain business environment. Ethical leadership also creates the right organizational climate for nurturing excellence among employees and maintaining sustainability of business.

## Indian Wisdom and Ethical Leadership

It may be pertinent here to share some of the powerful insights of classical Indian wisdom by two of the spiritually enlightened leaders of modern India who also happened to be institution builders and organizational leaders. Swami Vivekananda, the spiritual ambassador of India in the West, in his first lecture in the East at Colombo after returning from the West, pronounced in terms bold and clear: "India's gift to the world is the light spiritual" (Swami Vivekananda 2008: 8). And Rabindranath Tagore, the Nobel Laureate sage-poet from India, during his visit to China, raised the authentic Oriental voice: "In Asia, we must unite, not through some mechanical model of organisation, but through a spirit of true sympathy" (Tagore 2002: 51). What then is the essence of Indian spirituality?

Indian spirituality is ever an all-encompassing concept that includes the mundane and the temporal as well as the highest philosophical thoughts and the transcendental domains of our existence. While pursuits of money, fame, power find their respective place in the scheme of life, all these are covered within an over-arching framework that gives pre-eminence to a higher purpose in life – that is, self-realization through continuous striving for self-exploration by way of gradual

unfolding of different layers of our consciousness – physical or material, vital, mental, intellectual, and finally the spiritual. It consists in not just the revelation of the Self but also of the world in which one lives for better and clear understanding of its myriad of objects – things and beings, movements and phenomena, problems and multiple realities.

According to Indian philosophy, there are four-fold values (*Purushartha*) of life to be pursued by an individual during one's earthly existence. These are *Dharma* or righteousness, *Artha* or material well-being, *Kama* or aesthetic pursuit and desires, and *Moksha* or liberation from the multifarious bondages of the self in one's journey towards enlightenment. In the spiritual literature, the surge for *Artha* and *Kama* has been likened to the turbulent flow of a roaring river that is regulated by *Dharma* and *Moksha*, its two embankments. Down the annals of Indian spiritual history, there had been sages, seers, and monks who had advocated maintaining the balance of our life and harmony with the world around us by keeping this vibrant flow of life regulated by the higher pursuits of righteousness and self-liberation.

This framework is also valid for business organizations where the single-pointed pursuit of profits is tempered by awakening of our sense of social responsibility whereupon the enterprise attempts to give back to the world what it has received in the form of resources for its own survival, sustenance, and growth. This implies an expansion of the leadership consciousness to include all our stakeholders within our domain of concern and interests. This promotes inclusive or holistic thinking among the leaders so that they do not fall into the traps of linear thinking and binary logic that stifles our imagination and blocks our creative potential. One slowly begins to acknowledge that there is an organic linkage between the firm and all its stakeholders and that the long-term sustenance and growth of the firm is a direct function of the steady growth of all its stakeholders. The perennial wisdom of Indian spirituality has never advocated the killer instinct that is demanded in order to keep aflame the spirit of aggressive competition in the marketplace of business or life. Instead of championing the win-lose

game, it has always promoted the win-win situation for the common good and welfare of the many (“*bahujanahitaya bahunasukhaya cha*”). The sages of the Upanishads, the vast body of Indian spiritual wisdom literature, had chanted the prayer: “*Lokah samastah sukhinah bhhavantu*” (May all be blessed with happiness). Bhagavadgita, the celebrated text of Indian spirituality that is the crystallization of the wisdom of the Upanishads in 700 verses, has mandated upon the leader the responsibility of “*lokasamgraha*” (the well-being of all). It uplifts the leadership consciousness from one-pointed pursuit of money and profits towards discharging enlightened responsibility to serve the interests of all stakeholders including the community. The community no longer remains a separate entity “out there” but becomes an integral part of the organizational reality by way of acceptance, accommodation, and assimilation of the stakes of “the other” into one’s own ambit of concern. In the field of organizational strategy and processes, this finds space in the framing of the Vision-Mission-Values exercise and thus percolates down the line across all levels of the enterprise. Finally, it permeates into the DNA of the organization by making it an integral part of the life-blood of the firm through vibrant and invigorating learning methods and culture building processes. Such an enlightened and inclusive culture finds expression in the spontaneous attitudes and behavior of the employees that become naturally oriented to think beyond the physical and structural boundary of the organization and embrace the others.

### **Ethically Enlightened Management Education in India: Inspirational Initiatives**

At an institutional level, the creation of the Management Centre for Human Values (MCHV) Indian Institute of Management (IIM) Calcutta under the leadership of the late Professor S K Chakraborty can be highlighted as a pioneering initiative and movement towards integrating spirituality (based on classical wisdom of India) and

human values in the field of management education.

The evolution of the discipline of management has taken place along with constant nourishment from the global cultural mosaic and philosophical systems. Max Weber found the connection between the Protestant Ethic and the spirit of Capitalism. Oriental management principles and practices in Japan and China largely owe their roots in Confucianism and Shinto-ism. The question that naturally used to haunt the conscientious Indian mind – What can be the contribution of the millennia old Indian philosophy and culture to the domain of modern management?

The formal creation of MCHV became a reality in August 1992 through a resolution passed by the Board of Governors of IIM Calcutta that entrusted upon the Centre the mandate to engage in research and teaching on Indian Ethos and Human Values in Management. The courses offered from the Centre enriched the students and corporate executives with deep insights into Human Values in Management based on classical wisdom literature of India (mainly Yoga-Vedanta Philosophy, Upanishads, and the Bhagavadgita) as well as life and works of great modern Indian seer-leaders and institution builders like Rabindranath Tagore, Swami Vivekananda, Mahatma Gandhi, and Sri Aurobindo. The Centre was able to draw attention and participation from serious and conscientious thinkers from all over the world in this movement of Human Values and Spirituality in Management. The books by Professor Chakraborty, the Founder-Convener of the Centre, constitute a treasure house of insights and wisdom in this domain of management and beyond. Beyond intellectual and cognitive ethics, Chakraborty (1997) introduced the concept and highlighted the importance of “Consciousness Ethics” for value-based enduring transformation of the self and the collective entities. The spectrum of offerings from the Centre also included such pertinent and practical courses like Business Ethics and Corporate Social Responsibility. Later the Centre was included under the mainstream umbrella of IIM Calcutta within the academic group “Business Ethics and Communication.”

IIM Shillong, the seventh IIM and last of the old IIMs, placed premium thrust on Ethics and Sustainability since inception. At present, a separate academic group “Sustainability and Liberal Studies” has been formed to dedicate research and teaching exclusively around Business Ethics, Sustainability and Business, Corporate Social Responsibility, Wisdom Leadership, Management and Liberal Arts, among others. SUSCON, the Annual International Flagship Sustainability Conference of IIM Shillong, offers a global platform for dialogues and deliberations, research and international collaborations on the theme of Sustainability and Ethics covering its multiple dimensions and connotations. IIM Bodhgaya, one of the new IIMs, has created a Mindfulness Centre drawing inspiration from Buddhist Philosophy and Meditation to enrich modern management principles and practices.

At an international level, The European SPES (Spirituality and Ethics in Society) Forum is also an exemplary effort by a constellation of European scholars like Professor Luk Bouckaert and Professor Laszlo Zsolnai (among many others) in this direction. Global Ethics Forum by Christoph Stuckelberger in Geneva and International Society for Business Ethics and Economics (ISBEE) are exemplary initiatives in this area. The contribution of Judi Neal (1997) covering a repertoire of resources in this field of research also deserves special mention in this regard.

## Concluding Reflections

Experience with teaching of ethics and values in business and academia in general reveals a sordid and sterile exercise by and large. Instead of making the inputs vibrant and engaging, the disseminators of knowledge on ethics make the subject insipid and lifeless by reducing the immensely potent and diverse topic to dos and don'ts. Ethics is not just about going by the rules, the dos and don'ts, but having the courage to go beyond the rules when the time and the situation demands such breakthrough for a higher purpose. It is high time one must come out of the spell of

structured business school curriculum and emancipate their future generations with creative breakthroughs from being fossilized and ossified in a dark, stingy dungeon that is unfortunately celebrated today as the “real grind!” It may be worthwhile to reflect on the insights from three plays of Rabindranath Tagore who never went through the drudgery of formal school education – his powerful critique of stagnation in education in “Achalayatan” (The Stagnant Chamber), his espousal of the spirit of freedom in “Muktadhara” (The Free Flow), and celebration of joy through liberation from a mechanized life with the advent of the child of Nature (Nandini) in “Raktakarabi” (The Red Oleanders). Five centuries back, the stellar figure of European Enlightenment Leonardo da Vinci was harping on the need to cultivate “*sfumato*” – the ability to embrace paradoxes, uncertainty, and ambiguity – as a vital principle of learning for life. Truly enough Andre Gide had revealed – “The color of Truth is grey.” Truth thus prevails in the twilight zone beyond the black and white to bring in all possible colors to life perennial. Fiery and bold was the exhortation of the German philosopher Nietzsche – “If one is to live, one is to live dangerously.”

## Indigenous Environmental Justice

Deborah McGregor  
Canada Research Chair in Indigenous  
Environmental Justice, Osgoode Hall Law  
School/Faculty of Environmental Studies, York  
University, Toronto, ON, Canada

## Synonyms

Aboriginal environmental issues; Anishinaabek law; Indigenous rights; Indigenous world view

## Introduction

Environmental justice (EJ) can be defined as the struggle for an equitable distribution of environmental burdens and benefits across racial, ethnic, and economic groups (Haluza-Delay 2007). EJ commonly refers to the problem that people of color, Indigenous peoples, women, and people with disabilities, among others, are more likely than privileged white populations to live in toxic environments that are detrimental to both human health and community cohesion. In this conception of EJ, injustice is rooted in how social institutions are structured and operationalized in ways that favor powerful and privileged populations. These same populations, in turn, influence the structures and operations of social institutions in ways that protect their own interests without taking responsibility for the disproportionate burdens on other populations and communities (Whyte 2016, 157).

Current conceptions of environmental justice emerged in the United States in the early 1980s in response to a grassroots civil rights initiative aimed at stopping the state of North Carolina from dumping PCBs into Warren County, the county with the highest numbers of African American citizens in the state. Though not the first time that hazardous waste had been situated in close proximity to people of color and the poor, the Warren County protests brought national media attention to the issue, and “triggered subsequent events that would increase the visibility and momentum of the environmental justice movement” (Mohai et al. 2009, 408). Subsequent activism and studies revealed that people of color and poor communities in general face ecological crises to a far greater extent than the general population (Bullard 2001). They consistently bear, for example, a higher burden of exposure to air, water, and soil pollution. The people most affected by these conditions were understandably outraged (though perhaps not surprised) by these findings, and the environmental justice movement was born. Initially, the EJ movement focused broadly on people of color and the poor. Within this general scope, however, Indigenous peoples soon found a place to express their particular concerns.

Following a 1994 executive order from President Bill Clinton, the United States Environmental Protection Agency (USEPA) developed an EJ policy framework for that country. Despite its intended aim of addressing EJ, it has failed to fully consider the unique considerations of Indigenous peoples and tribes in the US (Harper and Harris 2011). A specific Indigenous and Tribal EJ policy was developed two decades later to begin attending to some of the shortcomings of the original policy (USEPA 2016). Even these efforts have resulted in some spectacular failures, however, as demonstrated by events surrounding the construction of the highly controversial Dakota Access Pipeline (Whyte 2017a). The continuation of human and Indigenous rights violations, despite the development of various instruments intended to address long-standing systemic injustices, is an ongoing global issue, as documented in

the United Nations’ *State of the World’s Indigenous Peoples* report (UNDESA 2009).

## Environmental Justice in an Indigenous Context

The context and lived reality of Indigenous peoples around the world is characterized by environmental colonialism and injustice, as exemplified in Indigenous environmental and climate justice declarations released over the past 25 years. As one international example, the “Kari-Oca 2 Declaration” produced at the Earth Summit in 2012, states that:

Since Rio 1992, we as Indigenous Peoples see that colonization has become the very basis of the globalization of trade and the dominant capitalist global economy. The exploitation and plunder of the world’s ecosystems and biodiversity, as well as the violations of the inherent rights of Indigenous Peoples that depend on them, have intensified. Our rights to self-determination, to our own governance and own self-determined development, our inherent rights to our lands, territories and resources are increasingly and alarmingly under attack by the collaboration of governments and transnational corporations. Indigenous activists and leaders defending their territories continue to suffer repression, militarization, including assassination, imprisonment, harassment and vilification as “terrorists.” The violation of our collective rights faces the same impunity. Forced relocation or assimilation assault our future generations, cultures, languages, spiritual ways and relationship to the earth, economically and politically. (IEN 2012, para 3)

James Anaya, former United Nations Special Rapporteur on the Rights of Indigenous Peoples, points to a similar situation in Canada, arising from a state of continued environmental colonialism:

One of the most dramatic contradictions indigenous peoples in Canada face is that so many live in abysmal conditions on traditional territories that are full of valuable and plentiful natural resources. These resources are in many cases targeted for extraction and development by non-indigenous interests. While indigenous peoples potentially have much to gain from resource development within their territories, they also face the highest risks to their health, economy, and cultural identity from any associated environmental degradation. Perhaps more importantly, indigenous nations’ efforts to protect their long term interests in lands and resources often fit uneasily

into the efforts by private non-indigenous companies, with the backing of the federal and provincial governments, to move forward with resource projects. (Anaya 2014, 19)

Environmental *injustice*, with clear roots in colonialism, forms the basis for framing the emergent scholarship on Indigenous environmental justice as activism. While the broad concept of environmental justice has been relatively well characterized in numerous Indigenous declarations at all levels (from the local to the global), defining specifically *Indigenous* environmental justice (IEJ) is very much a work in progress. This is due in large part to the fact that those who are primarily seeking justice in this case – Indigenous peoples – are only just beginning to have their voices heard regarding the troubling colonial legacies that have led to the ongoing injustices they suffer. If the field of EJ is to have any relevance to Indigenous peoples, particularly in relation to addressing injustice, it must be developed substantially out of the experiences, perspectives, and world views of Indigenous peoples themselves.

Attempts at making the EJ field responsive to Indigenous peoples involves a unique set of considerations that necessitates the drawing of conceptions of Indigenous sovereignty, law, justice, and governance into the conversation (Westra 2007; Whyte 2011). It requires an examination of not only power relations among peoples (that tend to result in a disproportionate burden being shouldered by less dominant segments of society), but also of the colonial legacy that continues to play out in laws, court cases and policies that systematically, institutionally, and structurally enable ongoing assaults on Indigenous lands and lives (Whyte 2017b). The failure of current political and legal systems to bring about environmental justice requires that EJ scholarship must give serious consideration to the worldviews, philosophies, and knowledges of Indigenous peoples, including Indigenous legal orders, as central tenets in defining Indigenous environmental justice frameworks. The development of any IEJ policy or framework

must ground its foundations in Indigenous epistemology to truly reflect Indigenous conceptions of what constitutes *justice*.

Indigenous legal scholar Wenona Victor agrees that Indigenous peoples need to frame justice issues from their own worldview and epistemological standpoints. It is not wise, in her view, to rely on western, colonial frames of justice to address the concerns of Indigenous peoples. Justice from an Indigenous point of view differs substantially from Western views in a number of ways. For example, in Indigenous cultures, justice is not limited to relations among people alone, but includes other relatives as well. Environmental justice is therefore not just about inequitable and unjust relationships among people, but among “all our relations.” Injustices are not just about assaults on the lives of people, but on all the other beings that make up the environment (animals, plants, birds, water, etc.) as well (Victor 2007).

Such Indigenous ideas were recognized by the *First National People of Colour Environmental Leadership Summit 1991*, including the notion that all species have rights (UCC 1996). For an EJ policy framework to receive substantial Indigenous support, as it must in order to be successful in Canada, a major paradigm shift would have to occur within the EJ field. Indigenous epistemologies would need to be foundational in the development of such frameworks, rather than being limited to merely providing a “perspective” or being “included” as an “add-on” to existing EJ frameworks. Indigenous EJ frameworks would be situated within a context of Indigenous law, governance, and knowledge systems which outline the rights and responsibilities of all beings to each other. These systems already exist, and have done so for millennia.

Such a discourse takes us beyond rights to *responsibilities*. In Anishinaabe thought, for example, environmental justice requires cooperation, balance, and harmonious relationships to ensure sustainability. In an Anishinaabek context, IEJ would include obligations and responsibilities to all of Creation, including all beings, the

ancestors and those yet to come, the spirit world, etc.; it is not limited to the living or the “natural” world as seen through Western eyes (McGregor 2009). Furthermore, Anishinaabek justice would be supported by Anishinaabek law, which requires that people must cooperate with all beings in Creation (Borrows 2010).

An Indigenous EJ revitalization process, however, does not ignore the fact that Indigenous justice, laws, and governance must co-exist along with other forms of justice. In turn, the state is not absolved of its responsibilities to Indigenous nations through fiduciary and treaty obligations. In many cases, there may perhaps be simply a sharing of common concerns regarding environmental sustainability and other issues. There remains a role for nation states, such as the United States and Canada, civil society, academia, and other sectors, in that Indigenous peoples require the necessary space to renew, regenerate, revitalize, and practice Indigenous conceptions of justice (Borrows 2010).

Indigenous nations are diverse and so are their legal and justice systems. As such, there will be no single definition of Indigenous environmental justice. Indigenous epistemologies vary significantly across nations, yet similar principles emerge that bear further study. Similarly, the IEJ field is only beginning to be developed. There are numerous ideas currently under exploration.

One of the major commonalities of Indigenous perspectives in relation to justice, and a key way in which Indigenous perspectives differ markedly from their non-Indigenous counterparts, involves the conception of humanity’s relationships with the “more than human world” (Nelson 2013). Indigenous legal and justice systems draw on a set of Indigenous metaphysical, ontological, and epistemological assumptions about the place of humanity in the world which describe how people should relate to all of Creation (Borrows 2010).

These views are not radical from an Indigenous point of view, and furthermore, some of the work toward implementing such concepts in a modern

context has already begun. In New Zealand, for example, the Whanganui River is now officially recognized in the country’s legal system as having personhood, and therefore, rights. Acting on a grander scale, Bolivia has enacted a *Law of the Rights of Mother Earth*, and Indigenous peoples from across the globe have charted a renewed vision of sustainability that includes the concept of living well, or *Buen Vivir*, an idea that has regained prominence in Latin America (McGregor 2016). The field of Indigenous environmental justice concerns itself with a desirable future, which involves justice not only for peoples, but for the natural world itself as a peopled cosmos.

## Indigenous Land Management: Responsibility-Based Ethics

Deborah McGregor

Canada Research Chair in Indigenous Environmental Justice, Osgoode Hall Law School/Faculty of Environmental Studies, York University, Toronto, ON, Canada

## Synonyms

Aboriginal resource management; Indigenous environmental justice; Traditional ecological/environmental knowledge

## Introduction

Understanding ethics in Indigenous land management involves examining relationships between Indigenous people and “nature,” how these relationships have changed over time, and how they continue to challenge the dominant world economic order. In essence, Indigenous ancestral or traditional land ethics transcend the “human dimension” to consider land, waters, wildlife, aquatic life, etc. as possessing being and agency and needing to be related to as such (Borrows 2010). This way of relating to the natural “other than human” or “more than human” world (Nelson 2013) stands in direct contrast to dominant society’s tendency to commodify the natural world for human benefit (and only for some populations of humans at that; see the *Environmental Justice* entry).

These contrasting land management ethics often result in conflict when they come into contact with one another; for example, as part of resource development/extraction projects which are often met with widespread Indigenous opposition, as was recently seen in the Dakota Access Pipeline struggle in the United States (Whyte 2017). Current land management practices further exacerbate the false notion of the divide between humans and nature/environment.

Indigenous traditional land ethics recognize and make management decisions based on the understanding that humanity is an integral *part of* nature, not *apart from* it.

The ramifications of these divergent ethics in land management have core political implications, as noted in the following quote, taken from the *Kari-Oca 2 Declaration*, which states:

Since Rio 1992, we as Indigenous Peoples see that colonization has become the very basis of the globalization of trade and the dominant capitalist global economy. The exploitation and plunder of the world's ecosystems and biodiversity, as well as the violations of the inherent rights of Indigenous Peoples that depend on them, have intensified. *Our rights to self determination, to our own governance and own self-determined development, our inherent rights to our lands, territories and resources are increasingly and alarmingly under attack by the collaboration of governments and transnational corporations.* Indigenous activists and leaders defending their territories continue to suffer repression, militarization, including assassination, imprisonment, harassment and vilification as “terrorists.” The violation of our collective rights faces the same impunity. Forced relocation or assimilation assault our future generations, cultures, languages, spiritual ways and relationship to the earth, economically and politically. (Kari-Oca 2 Declaration 2012, para 10, italics mine)

The Kari-Oca 2 Declaration also reiterates Indigenous peoples' obligations to the natural environment, emphasizing an ethic of responsibility: “We reaffirm our responsibility to speak for the protection and enhancement of the well-being of Mother Earth, nature and future generations of our Indigenous Peoples and all humanity and life” (para 1). Discussion of land ethics, then, necessitates engagement with Indigenous rights, self-determination, and sovereignty as part of realizing these responsibilities. While it is important to remember that Indigenous nations are diverse and have over countless generations maintained their connections and responsibilities to land in varied and distinct ways, international declarations such as *Kari-Oca 2* offer collective perspectives that provide important insights into some commonalities in Indigenous land ethics that continue to shape the discussion around governance and management of lands worldwide.

The *Kari-Oca 2 Declaration* highlights a prolonged history of imperialism, colonialism, and capitalism that has severely undermined Indigenous peoples' self-determination and capacity to govern and manage their lands. As such, this contribution is focused on how Indigenous peoples are seeking to re-establish their sovereignty in the face of ongoing and institutionalized colonialism and its various expressions at local, regional, and global scales.

## Contemporary Relationship to Land<sup>1</sup>

The disruption of Indigenous peoples' relationships to Land has had devastating consequences in every aspect of Indigenous peoples' lives (RCAP 1996). As Professor John Borrows writes:

Aboriginal peoples regard their traditional lands as sacred; it is integral to their culture and identity. They want to continue living on territories that have sustained them for thousands of years. Yet the Crown now claims occupation of traditional Aboriginal lands. When the Crown claims more land, this leads to conflict. Aboriginal peoples desire to hold onto their lands and resources to be more productive and preserve their ancient relationships. They struggle to resist further removal from their territories (Borrows 2005, 3).

Contemporary expressions of Indigenous land ethics (too often requiring civil disobedience and other direct action methods) are thus best understood from a historical context that dates back centuries. This history involves the systematic and often brutal dispossession of Indigenous peoples from their lands and livelihoods. Imperialism, colonialism, industrialization, and capitalism all require land, resources, and *peoples* to exploit. They are concerned with acquiring lands and resources – often illegally (by the usurpers' own colonial laws), and certainly without consent from

<sup>1</sup> ‘Land’, from an Indigenous perspective, carries with it the idea of journeying, of being connected to, and interconnected with, geographic and spiritual space – in other words, it represents a deep sense of identification through a cosmological and ecological connection to both the ‘natural’ and spiritual worlds (Styres and Zinga 2013, 303). ‘Land’ is capitalized to denote the Indigenous understanding that Land is not a resource/commodity.

Indigenous peoples – through such notions as the “doctrine of discovery” and “terra nullius.” The original imperial nation states were purposeful and violent in their efforts to dispossess Indigenous peoples of lands, and new nation states such as Canada and the USA followed suit.

Various strategies were employed over time in Canada to dispossess Indigenous peoples of their lands and resources. In many cases Indigenous peoples were subject to outright removal and/or relocation through the establishment of the reserve system. Systematic dispossession occurred through treaty-making that sought to extinguish Indigenous title, and through the imposition of Crown-state land management systems that ignored, and in many cases aimed to directly undermine, Indigenous authority and jurisdiction over their territories (RCAP 1996). As Land is central in maintaining Indigenous nationhood through ethical relationships with it, most conflicts between Indigenous and non-Indigenous peoples involve disputes around territories and the valuable resources they hold (Linden 2007; RCAP 1996). It is important to think of these struggles as conflicts not only over the use of Land but also as conflicts between competing legal-political and knowledge systems. As Borrows (2005, 8) adds, “When non-Aboriginal peoples ventured forth from their lands into North America, they encountered peoples with well-developed laws and duties related to land and resource use.” Indigenous peoples are seeking to secure their relationship to Land in order to support their own nationhood, autonomy, and well-being.

To summarize, Indigenous land ethics are about seeking to establish (or re-establish) reciprocal responsibilities to the Land so as to ensure that future generations, and the Land itself will flourish. In most areas of the world, organizations such as governments, multinational corporations, ENGOs, and small private interests including homeowners are now seen by dominant society to “possess,” “own,” and/or otherwise control the vast majority of what were, and still are, Indigenous lands. It is within this hugely challenging scenario that Indigenous peoples seek to re-assert their connections and obligations to the Land.

Current controlling interests employ their own governance and management systems in ways that are often in direct contrast to how Indigenous peoples understand that such relationships should be engaged in. Indigenous nations challenge the dominant nation states’ conception of land-as-a-resource, as a commodity to be bought, sold, and managed. Accordingly, Indigenous peoples have internationally declared principles they say must be followed in order that relationships to Land may be re-established and maintained. These include requiring that dominant nation-states:

- Recognize and respect the self determination of Indigenous Peoples, in particular our rights to territories and natural resources, in accordance with the United Nations Declaration on the Rights of Indigenous Peoples (UNDRIP).
- Ensure and guarantee the full and effective participation of Indigenous Peoples at all levels, respecting the processes based on consultation and free, prior, and informed consent (FPIC) in accordance with the United Nations Declaration on the Rights of Indigenous Peoples.
- Recognize, respect, and strengthen the fundamental contribution of the traditional knowledge, innovations, and practices of Indigenous Peoples.
- Review the concepts of development based on the accumulation of wealth that emphasizes unlimited exploitation of natural resources. (FPP 2011, para 3)

The frames identified above highlight key areas for consideration in understanding Indigenous Land management ethics at every level and scale. Each frame will be briefly discussed below.

### UNDRIP and Self-Determination

In its preamble, the *United Nations Declaration on the Rights of Indigenous Peoples* (UNDRIP) recognized:

the urgent need to respect and promote the inherent rights of indigenous peoples which derive from their political, economic and social structures and from their cultures, spiritual traditions, histories and

philosophies, especially their rights to their lands, territories and resources. (UNGA 2007, preamble)

UNDRIP offers an important starting point in recovering relationships to Land. It provides a guide to supporting self-determination in recognizing that Land is an encompassing concept in an Indigenous context; it is a core aspect of Indigenous freedom and autonomy. UNDRIP is heralded as a critical document for recognizing Indigenous rights, as well as for identifying the types of measures required to hold nation states accountable for respecting those rights. For example, article 26 in UNDRIP states that:

1. Indigenous peoples have the right to the lands, territories, and resources which they have traditionally owned, occupied, or otherwise used or acquired.
2. Indigenous peoples have the right to own, use, develop, and control the lands, territories, and resources that they possess by reason of traditional ownership or other traditional occupation or use, as well as those which they have otherwise acquired.
3. States shall give legal recognition and protection to these lands, territories, and resources. Such recognition shall be conducted with due respect to the customs, traditions, and land tenure systems of the indigenous peoples concerned.

UNDRIP recognizes the importance of Indigenous land management governance and management practices to achieving self-determination. At the same time, it highlights the fact that nation-states and those authorized through them have undermined Indigenous and human rights with devastating outcomes. UNDRIP seeks to support Indigenous self-determination through the recognition of rights (cultural, social, economic) primarily through recognizing land rights (Venne 1998). These rights must be recognized at every scale, from the local to the international.

### UNDRIP and FPIC

UNDRIP also requires that Free Prior and Informed Consent (FPIC) be obtained for any

activities that impact the Lands and livelihoods of Indigenous peoples. FPIC is mentioned a number of times in UNDRIP in reference to lands and is specifically described in Article 32, as follows:

#### *Article 32*

1. Indigenous peoples have the right to determine and develop priorities and strategies for the development or use of their lands or territories and other resources.
2. States shall consult and cooperate in good faith with the indigenous peoples concerned through their own representative institutions in order to obtain their free and informed consent prior to the approval of any project affecting their lands or territories and other resources, particularly in connection with the development, utilization, or exploitation of mineral, water, or other resources. (UNGA 2007)

FPIC has significant implications for land management, to the extent that Indigenous peoples are able to exercise this right. As stated, it requires consent to be given before any development proceeds. Many nation-states have balked at this requirement, despite an otherwise broad endorsement of UNDRIP. As Indigenous peoples have documented in international environmental and climate change declarations, resource exploitation continues without their consent on a daily basis with devastating results. Despite reservations expressed by nation-states, other bodies have begun to determine what FPIC means for their operations (the Forest Stewardship Council, for example, has developed FPIC guidelines, see FSC Canada, nd.). Many nation-states have attempted to address FPIC through their existing consultation and accommodation processes, which clearly remain inadequate as evidenced by ongoing conflict over land and resource decisions. FPIC is a critical higher standard to which nation-states can be held accountable. How FPIC becomes fully realized will be seen in the coming years as its practical implications become clear to all concerned.

### Traditional Knowledge

Another critical frame for understanding Indigenous land management ethics is the recognition and utilization of Indigenous knowledge systems (IKS), also referred to as Traditional Ecological

Knowledge (TEK) or Traditional Knowledge (TK). Since the Earth Summit in 1993, the recognition of TK has found significant expression in various agreements such as the *Convention on Biological Diversity*, and more recently in the *Paris Agreement on Climate Change*. TK has guided Indigenous peoples' land management and governance for thousands of years. What is new is the interest in and recognition of these systems by governments, academics, ENGOs, and others. UNDRIP recognizes TK throughout and in the preamble states that "respect for indigenous knowledge, cultures and traditional practices contributes to sustainable and equitable development and proper management of the environment" (UNGA 2007). Nation-states such as Canada have recognized TK in national environmental legislation in areas such as environmental assessment and protection. TK is also recognized in co-management and co-governance processes (Bowie 2013). Indigenous nations assert that TK should be considered alongside Western science in land and resource management decision-making. TK continues to grow in importance as Western knowledge alone continues to fail to enable sustainability.

### Critiques of Development

Non-Indigenous Peoples have come to our lands and resources to benefit themselves. And to the impoverishment of our peoples. Indigenous Peoples are victims of development. In many cases Indigenous Peoples are exterminated in the name of a development program. There are numerous examples of such occurrences. (Kari-Oca Declaration 1992, 6)

Indigenous peoples have been largely critical of concepts of development that have contributed to ongoing dispossession. "Development" is often experienced in disastrous ways. It generally occurs without the free, prior, and informed consent of Indigenous peoples and has "led to destruction or loss of ancestral territories and resources, denigration of indigenous worldviews and values and of their political, economic and socio-cultural systems and institutions, ecosystem

degradation, displacement and violent conflicts" (ECOSOC 2005, 3).

If UNDRIP is to act as a frame for development that serves Indigenous peoples, it must set an agenda consistent with the goals of self-determination, namely, to empower Indigenous nations to set their own course towards a desired future. As UNDRIP states, "indigenous peoples have suffered from historic injustices as a result of, inter alia, their colonization and dispossession of their lands, territories and resources, thus preventing them from exercising, in particular, their right to development in accordance with their own needs and interests" (UNGA 2007, preamble). One of the greatest new challenges to the application of Indigenous land ethics, and one which will no doubt be the subject of forthcoming activism, is the imposition of undesired development under the guise of sustainable development or the green economy.

### Closing Thoughts

The whole model of civilization that began 500 years ago with the pillaging of the natural resources for profit and the accumulation of capital, is in crisis. The alternative is to change the system, not the climate, based on a new paradigm for civilization, Living Well with harmony between the peoples and Mother Earth. (FPP 2011)

Indigenous land ethics call for a new way of relating to the natural world. International efforts have focused on human and Indigenous rights' aspects of self-determination and rightly so. However, there is an additional important dimension to understanding Indigenous land ethics, and that is the ethic of responsibility. Indigenous peoples aspire to live up to their *obligations and responsibilities* to care for the natural world. This novel (from a non-Indigenous perspective) ethic is expressed through the *Universal Declaration of Rights of Mother Earth*, which states that "Every human being is responsible for respecting and living in harmony with Mother Earth." The ethic of upholding the rights of

Mother Earth is gaining ground and has been enacted through constitutional and legal mechanisms in both Ecuador and Bolivia. This Indigenous framework directly challenges the dominant neoliberal paradigm of human interactions with the Earth that regards nature as property and a resource (McGregor 2016). These frames call for new ethical ways of engaging with the Land. They are a call for widespread change at every level, by every nation and every human that holds responsibilities to the well-being of the Land.

Extractive industry; Human rights; Indigenous rights; Self-determination; Sustainability; Tribal peoples; Values

## Indigenous Peoples and the Ethics of Resource Extraction

More than 370 million indigenous peoples encompass some 5,000 distinct cultural identities spread across 90 countries worldwide (UN 2009). The territories upon which they depend for survival cover about 20% of global land surface, yet hold 80% of the planet’s biodiversity (Sobrevila 2008). Indigenous peoples make up just 5% of the world’s population, yet comprise upward of 90% of Earth’s cultural diversity speaking roughly 70% of the world’s remaining 6,000–7,000 languages, half of which are threatened with extinction this century and even more of which are experiencing critical attrition of the ecological contexts that keep their languages alive (Posey 1999; Toledo 2001; Sobrevila 2008). Thus, the areas of greatest biodiversity on Earth hold the planet’s greatest cultural diversity in a symbiotic relationship of ecology and culture: where those ecosystems are strong so are the languages and where the languages are threatened so are their ecosystems (Nettle and Romaine 2000). While much of Earth’s natural resources occur within their territories<sup>1</sup>, indigenous peoples continue to struggle for a determining voice in the decision-making processes that determine the stewardship and extraction of those natural resources.

Indigenous peoples are disproportionately impacted by industrial resource extraction, yet have reaped historically little benefit from it. From Europe to Asia, Oceania, Africa, and the Americas, industrial resource extraction has led to various ecotoxicological, human health, socioeconomic, and cultural impacts on indigenous peoples accompanied also by human rights violations.<sup>2</sup> For example, in the western Amazon where some indigenous peoples still live in voluntary isolation, petroleum development has been

<sup>1</sup>For example, it has been estimated that over half the world’s remaining mineral resources may be located in the territories of indigenous peoples. See the “Introduction” to Doyle’s (2015) monograph, *Indigenous Peoples, Title to Territory, Rights and Resources*.

<sup>2</sup>For a worthwhile resource, see Survival International: <http://www.survivalinternational.org/tribes>.

attended by sexual exploitation, sickness, and mortality from pollution, disease, and violence (Kimerling 2006; Napolitano 2007; Napolitano and Ryan 2007; Finer et al. 2008; Orta-Martinez and Finer 2010; Schmall 2011). The disparities and vulnerability of indigenous peoples due to social, historical, political, economic, health, and other material factors are well documented (Gracey and King 2009; King et al. 2009; Reading and Wien 2009; Reading and Halseth 2013). Thus, in spite of their contiguity with tremendous natural wealth, indigenous peoples are among the poorest, most politically and economically marginalized of peoples on the planet (O’Faircheallaigh and Ali 2008; Sobrevila 2008; UN 2009).

Indigenous peoples also provide the longest sustained examples of human use of and adaptation to the environment. Given a dependence upon healthy ecosystems for their traditional ways of life, indigenous peoples have a fundamental stake in sustainability. Their traditional ecological knowledge and resource management systems contribute to the maintenance and conservation of biodiversity, ecosystem management, and sustainable development (Posey 1999; Berkes et al. 2000; Toledo 2001; Toledo et al. 2003; Lertzman and Vredenburg 2005; Sobrevila 2008; Lertzman 2010). Yet, ongoing attrition of indigenous lands places increasing constraints on their traditional land use and its practices rendering indigenous subsistence economies less viable. A calamitous result of global industrialization is that as consumer society inexorably grows, indigenous peoples’ territories shrink.

This dynamic of consumer society growing at the expense of indigenous peoples, their territories, and ways of life underscores the basic ethical problem of industrial resource extraction and its impacts on indigenous peoples. Is it ethical to sacrifice the viability of indigenous peoples and their ways of life for the sake of industrial resource extraction driven by growing, consumer-based economic development? If not, ethics requires an approach to resource extraction in the territories of indigenous peoples consistent with their wishes and needs as they determine these to be (Lertzman and Vredenburg 2005),

based on principles of self-determination with practices of free, prior, and informed consent.

As resource extraction expands into progressively remote, ecologically salient regions where much of the world’s natural resources remain, most indigenous communities will face the prospect of industrial resource extraction on their traditional lands and what this means for their people. Some indigenous peoples have resisted the penetration of extractive industry into their territories;<sup>3</sup> others have engaged with industry.<sup>4</sup> The fundamental issue is self-determination. Respecting the self-determination of indigenous peoples stipulates that resource extraction only occurs with prior and freely determined informed consent in their territories.

The principle of free, prior, and informed consent, or “FPIC,” has received particular attention since the adoption of the United Nations (2007) *Declaration on the Rights of Indigenous Peoples*. The right to withhold or give consent for natural resource extraction in their territories, or the obligation to obtain the free, prior, and informed

<sup>3</sup>This has resulted in ongoing opposition and at times violent conflict. Examples include mining and the Bougainville Conflict in Papua New Guinea from the 1980s to 1990s; expulsion and internment of Penan peoples due to logging in Sarawak, Borneo, Malaysia, since the 1980s; oil conflict in Niger Delta with Ogoni people ongoing from the 1990s; violent conflict with indigenous Amazonians in Bagua, Peru, in 2009, in Puyo, Ecuador, in 2015, and currently in the Pastaza region of Ecuador with Shuar and Achuar peoples in response to consultation issues related largely to petroleum and mining more recently; confrontations between police and Mi’kmaq people of New Brunswick, Canada, over fracking, 2013; ongoing conflict related to palm oil expansion in Indonesia and Malaysia; ongoing opposition to the Bello Monte Dam by indigenous peoples along the Xingu River, Brazil; opposition to Site C Dam by Treaty 8 First Nations of Canada; ongoing concerns and opposition to uranium mining by Navajo people in the United States; and resistance to the Dakota Access Pipeline by indigenous peoples in South Dakota, 2016/2017.

<sup>4</sup>Examples include agreements with mining companies and Aboriginal peoples in central Australia; agreements between Dene people and diamond mining industry in Canada’s Northwest Territories; collaborative economic development initiatives with Treaty 8 First Nations and petroleum industry in Alberta, Canada; Sakhalin Island indigenous peoples’ agreements with petroleum industry in Russia.

consent of indigenous communities, has emerged as a central feature of indigenous peoples' rights. Increasingly recognized by intergovernmental organizations, international bodies, industry actors, and civil society organizations, and emerging also in some domestic legal systems, FPIC is becoming a defining issue for global extractive industry (Doyle 2015). Consequently, concurrent political and constitutional processes unfolding in various countries are advancing the FPIC agenda as indigenous peoples and their allies advocate for indigenous rights in countries around the world.

What are the implications for extractive industries? Risk increases significantly for projects carried out in proximity to the territories of indigenous peoples where aboveground non-technical risk, including stakeholder resistance, accounts for the majority of project delays in the petroleum and mining sectors worldwide (Hackenbruch and Pluess 2011; Adamson and Pelosi 2014). Such risk exposure can be mitigated through policies that recognize indigenous peoples' rights and meaningful efforts to establish positive relations with indigenous communities. Accompanying these developments is a growing awareness of the destructive impact of resource extraction on indigenous communities and the need for implementing ethical principles that should govern the extraction of natural resources in the territories of indigenous peoples.

What does this mean for companies operating in indigenous peoples' territories? It means respecting how indigenous communities wish to be consulted, and eventually involved, should they decide to collaborate with industry on resource development initiatives. It also requires that the wishes of indigenous peoples be respected should they reject extraction of natural resources in their traditional territories. As hereditary chief A-in-chut of the Ahousaht Nation and two-term chief of Canada's Assembly of First Nations, Shawn Atleo pointed out not only must industry "be prepared to speak" with the indigenous peoples in the territory of their operations, they "must be prepared to leave" (Atleo 2015).

Obtaining the free, prior, and informed consent of indigenous peoples for resource extraction in their territories may not be easy, but it is the right thing to do. Verily, ethics can be a positive influence for developing new business practices (Cragg 1997). Thus, FPIC may help companies see their relationships with indigenous peoples in new ways resulting in innovative business practices opening the door to new possibilities in collaboration and partnership for respectful long-term relationships with indigenous communities with reduced risk of conflict and enhanced social license.

The ethics of resource extraction and indigenous peoples is a global issue that speaks to the nature of industrial society, its expansion, and the persistence of colonialism. The idea that indigenous peoples, and the ecosystems upon which they depend, are somehow expendable and the inevitable, if regrettable victims of economic progress, is deeply embedded within the thinking of modern society. This thinking lies at the root of the ethical problem whereby the unsustainable consumptive behaviors of industrial societies are maintained through resource extraction, which is carried out increasingly at the expense of indigenous peoples and their traditional ways of life. We are essentially deficit spending the cultural diversity of our species and the biological diversity of the planet to maintain an unsustainable lifestyle at the expense of some of the longest standing examples of sustainable human culture. We do so at our peril.

The diminishing of indigenous peoples has implications for all humanity. With each vanishing language, we lose an identity, a culture, and a way of life, taking with it an irreplaceable example of thousands of years of human experience, knowledge, and adaptation to the environment. Adaptation is a key feature of evolution, and humans have unique capabilities that allow us to adapt and evolve culturally (Henrich and McElreath 2003). This is our competitive advantage as a species for we can choose to change; yet, the movement toward industrial monoculture amplifies shared cultural blind spots while

concurrently diminishing the collective knowledge and wisdom base of our species, thus narrowing the range of thinking that informs our decisions. In reflecting upon these dynamics, one perceives a contrast of worldviews, values, and identities. Most contemporary governments and development agencies hold a perspective described as “technological expansionism” or the “expansionist paradigm” (Rees 1995, p. 347). Founded on a perceived separation of humanity from nature, this perspective posits economic growth as essential for human fulfillment assuming that nature can be exploited without limit and with impunity to satisfy ever-expanding human wants. Indigenous philosophies, in contrast, tend to affirm humanity’s place in nature as a spiritual foundation for human identity and development.

Oren Lyons, Faith Keeper of the Onondaga Turtle Clan and member of the Council of Chiefs for the Six Nations of the Iroquois Confederacy in the Northeastern United States, suggests that indigenous perspectives encompass the long-term view of community and life with respect to nature’s regenerative laws:

The earth does not need us: we need her. She functions under these universal laws that are immense beyond our comprehension. We, the Haudenosaunee, were instructed to bind ourselves to these universal laws to ensure the survival of our people. We know that other indigenous nations and peoples understand these laws and instructions . . . This then is what we can offer humanity the basis for making long-term decisions. We are responsible to life in the future. (Posey 1999, p. 450)<sup>5</sup>

As Chief Lyons notes, such teachings exist in many indigenous cultures. Embedded in these teachings and long-term thinking are ethics of stewardship, sacredness, and respect. These teachings are exemplified in Canada’s Pacific Northwest in the Nuu-Chah-Nulth concept of *hishuk ish ts’awalk*, meaning, “everything is one,” embodying the traditional values of

“sacredness of and respect for all things.” Ahousaht elder, the late Roy Haiyupis, explained:

Respect is the very core of our traditions, culture and existence. It is very basic to all we encounter in life . . . Nothing is isolated from other aspects of life surrounding it and within it. This concept is the basis for the respect for nature that our people live with, and also contributes to the value system that promoted the need to be thrifty, not to be wasteful, and to be totally conscious of your actual needs. (CSSP 1995, p. 6)

These ethical values of stewardship and long-term thinking reflect a profound sense of individual and collective identity. Boreal Cree traditional land-use practitioner and chief executive officer for the Lubicon Lake Band, Conroy Sewepagaham, framed it the following way, “When you respect the environment around you, you respect yourself; and when you respect yourself you respect the environment . . . it’s like a child: you take care of a child, eventually that child will take care of you” (Lertzman and MacDonald 2015).<sup>6</sup> The offering here is an invitation into an Earth-based understanding of what it means to be human.

There is a growing global recognition that insights from indigenous cultures provide meaningful contributions to address the unprecedented ecological, socioeconomic, and philosophical challenges currently facing humanity. If we are to achieve a planetary ethic of sustainability that values biological and cultural diversity with socioeconomic and ecological justice, the participation and partnership of indigenous peoples will be fundamental. In the absence of such participation, it is unlikely a path to this destination will be found.

## Individualism

John Douglas Bishop  
Trent University, Peterborough, ON, Canada

### Synonyms

Agent based social theory; Agents; Liberalism

### Definition

Individualism refers to ways of thinking that consider individual agents as fundamental rather than groups, collectives, or communities. There are individualist ways of thinking with respect to values in ethics and political philosophy, with respect to economic theory and to social science methodology, and with respect to government policies and individual behavior.

### Individualism in Ethics and Value Theory

Individualism has two aspects: individualism of agents and individualism of the objects of ethical concern. Much of ethics is individualistic in both respects; that is, it concerns the moral assessment of the obligations, actions, and attitudes of specific individuals towards other specific individuals. The obligations of individuals are usually referred to as duties; viewed from the perspective of the individual that the obligations are towards, they are usually referred to as rights (human rights, civil rights, and so on). However, ethical obligations can have sources other than the rights of individuals; examples might be the love of one's children, belonging to a community, or promises made.

Sometimes the individual basis of ethics is not obvious because moral obligations can be summarized in aggregations. For example, an individual's obligations towards their family mostly consists of obligations to specific people: father, mother, children, siblings, and so on.

Moral obligations which are not those of an individual include the obligations of communities, collectives, organizations, nations, and so on. For example, conversations about corporations as moral agents, such as those concerning the ethical obligations of corporations or the social responsibility of corporations, all rely on the idea that collections of humans, viewed together as a single fictional legal entity, can in fact be considered as an ethical entity. Some people doubt this and argue that corporate moral responsibility is a shorthand way of discussing the moral responsibility of the individuals who own and or run corporations (i.e., CEOs, shareholders, managers, and so on). Many business ethicists, however, think that we can ethically assess the actions and policies of both corporations (as entities) and the individuals who determine or benefit from corporate actions and policies.

All views that do not base ethical judgment on individuals raise difficult questions about collective responsibilities (and collective guilt in cases of moral failure). For example, who was responsible for the US invasion of Iraq in 2003? George W. Bush and Tony Blair certainly bear personal responsibility but can we also say that America bears moral responsibility? Or that the American people are collectively responsible? Collective guilt and responsibility are very difficult concepts as discussions of corporate and government actions make clear.

However, there has been a long history of passing ethical judgements on societies, nations, and other large collectives. The language of justice, freedom, equality, rule of law, and other such topics allow us to ethically assess some types of collectives. All such concepts involve passing ethical judgment on some aspect of society rather than on the actions of specific individuals. It makes perfect sense to talk about (un)free or (un)just countries, although it also makes sense to talk about (un)free and (un)just individuals.

Whether or not collectives have ethical obligations, it is clearer that collectives can be the object of moral responsibility. Individuals have obligations to communities, nations, religions, and humankind. Such obligations are not always the

aggregation of obligations to many separate individuals.

## Political Individualism

The value of the individual human being is fundamental to classical liberalism (see “► [Liberalism](#)”). What is of ultimate value in liberalism is the freedom, rights, dignity, security, health, and happiness of every individual in society. And in considering these values, every individual counts equally. Groups, communities, and societies are judged according to the aggregate individual fulfilment of these values.

It is this ultimate value that liberalism puts on every individual that distinguishes it from socialism, communism, communitarianism, fascism, nationalism, nativism, sectarianism, and even green political thought. All these other systems of political value place fundamental importance on something other than, or as well as, individual people.

In pursuit of the goals of maximizing the security, liberty, and dignity of every individual, classical liberalism values democracy, rule of law, human rights, freedom of speech, and widespread public education. Liberal societies are democratic; each individual gets one and only one vote because every individual has an equal stake in society (Copp 2000). Liberal societies are ruled by law, not by powerful people, because no individual ought to have power without legitimate democratic authority. Social and political hierarchies are anathema to liberals.

Human rights, often enshrined in law as constitutional rights, are important to liberals because they protect each individual from exploitation or abuse. When the United Nations passed its Universal Declaration of Human Rights, several communist countries refused to support it on the grounds that it protected individual rights and ignored collective rights, such as the rights of the proletariat as a class. A very different example of collective rights would be the right of the people of Québec to preserve French as the language of Québec. Such preservation involves not just the freedom and right of every individual to speak

French if they wish; it also involves language laws which, for example, insist that most public education and commercial transactions be in French. Some liberals view these laws as violations of individual rights, but Québec maintains them notwithstanding Canadian federal law and constitution.

## Individualism and Society

The relationship of individualism to society has three aspects: individualism as an explanatory assumption, individualism as defining the objects of study and analysis, and individualism as a positive or negative value. For the role of individualism in explanation, see next section.

Individualism is studied in sociology often by first establishing the degree of individualism versus the extent to which people are embedded in collectives such as families, communities, organizations, or churches. The book *Bowling Alone* (Putnam 2000), for example, measured changes in individualism versus embeddedness in American civil society. The basic claim Putnam makes is that individualism is (or was) on the rise in American society, and that Americans are becoming less embedded in community organizations. The book's title comes from the decline in membership in bowling leagues, but Putnam also mentions many other organizations with declining memberships such as churches, unions, volunteer organizations, mutual help organizations, and so on.

Sociologists study also the effects of individualism on individuals and society. There is an emerging consensus that social embeddedness is vital to good human health, and that the social isolation of individuals can cause mental and physical health issues to the point of seriously shortening human life. This has major implications for government policies, especially policies in health care and those concerning seniors. But the problems with excessive individualism also have implications for families, churches, and even businesses. And such problems have implications for individual choices; for instance, seniors (and others) are encouraged, as much as

possible, to attend social events and to maintain networks of family and friends.

Such data also affects the other aspect of individualism and society, namely, discussions of the value of individualism. Many writers place high value on communities and families, and view excessive individualism as a threat to social stability, peace, order, and the well-functioning of government and business. Some such writers consider themselves “conservatives,” which makes sense since conserving existing communities and social structures is an obvious way to encourage social embeddedness. Creating communities from scratch is difficult. David Brooks in his *New York Times* column frequently views excessive individualism as a problem and emphasizes the need for traditions and socially agreed values, stories, and myths (for example, see Brooks 2018).

The downside of individuals embedding themselves deeply in communities is sectarianism – a community can become exclusive, bigoted, and narrow-minded. Some sects proselytize for outsiders to join their group, try to impose their ways on other people, or try to exclude nonmembers from government, resources, and society. Much violence, wars, and terrorism come from an excess of individual embeddedness in a sect-like community. Sectarian violence is one of the worst disasters that can afflict a society.

However, individualism may not be a viable solution to sectarianism. It is a more promising idea to create open, welcoming, tolerant communities in which individuals feel free to choose to be or not to be embedded. Social harmony requires a balancing of individualism and community.

## Individualism in Social and Economic Explanation

Individualism in social explanation is often referred to as agent-based theory. For example, an agent-based theory of the incarceration rate in a country would explain that rate based on the motivations, emotions, and actions of the individuals who are criminals, judges, police and government prosecutors in that country. A non-agent-based theory would explain the incarceration rate

using social factors, not just the aspects of the individuals involved. For example, a non-agent-based theory might explain the incarceration rate using the county’s Gini-coefficient, historical trends, hierarchies of power, or other social or economic conditions. Such explanations can be referred to as system-based explanations.

An example from biology might make the generality of this distinction clearer. Some species of termites build temperature-stable mounds. A scientist might try to explain this outcome based on the rules that each ant follows assuming the individual ant knows nothing about the temperature-moderating outcome – which would be an agent-based theory. Or, on the other hand, the scientist might explain the outcome based on the evolution of the termite species in its particular environment – which would be a systems-based explanation.

Some methodologists argue that systems-based theories and explanations are incomplete unless they can be reduced to agent-based theories and explanations. Others argue that systems contain emergent qualities that cannot be reduced to the behavior of the individual agents in the system. The impossibility of reductionism might be based on epistemological theory (we can never know enough to understand the reduction), on ontological theory (emergent qualities of systems are part of the nature of the universe and even in theory they cannot be reduced to agent-based explanations), or on scientific methodology (one assumes nonreductionism as a method of proceeding without committing one way or the other to reduction’s possibility or reality).

Interest in agent-based modelling as a practical procedure in business and other areas has increased in the past 20 or so (Bonabeau 2002).

Economists (who may or may not view themselves as a sub-type of sociologist) have long had and continue to have methodological debates about the reduction of macroeconomics (which is about economies as systems) and microeconomics (which builds models given assumptions of how individuals behave). Is it necessary or even desirable for macroeconomic models to be built on microeconomic models? Are models that start at the agent level better models? Or are

macroeconomic models sufficient if they work and make satisfactory explanations and/or accurate predictions?

This debate is connected to other debates in economics. One important issue is whether economies are complex, adaptive, nonlinear systems with system-level emergent qualities; if so, then classical models of the economy are insufficient and perhaps even misleading. Some economists now advocate the use of systems theory and agent-based models (Haldane and Turrell 2018).

Another issue is that the agents of classical and neo-classical microeconomic theory are purely fictional; homo economicus (as such an agent is called) is based entirely on assumptions. Little or no effort was made for more than a 100 years to verify that the assumptions described actual human behavior; they were chosen so that linear models could be built. Eventually, behavior economists (and psychologists) investigated how individuals actually do behave in economic transactions and quickly established that most of the assumptions about homo economicus are false. If current descriptions of human behavior are accurate, then any economic model that starts with the interactions of individuals will have to be nonlinear. Nonlinear models are extremely difficult to build and make accurate – as is well known, for example, attempts to model the planet's climate. Alternatively, Milton Friedman (1953) argued that the accuracy of the assumptions made about individual agents does not matter as long as the model works.

## Summary

Individualism can influence many aspects of people's thinking. It can shape how they ethically judge actions, people, and societies; their notions of duties and rights; their political views and values; and their social attitudes and even actions. Individualism can also affect the methodology of sociology and economics, though there is much debate in those subject about the proper role of individualism.

## International Association for Business and Society

Alex C. Michalos

University of Northern British Columbia, Ottawa, ON, Canada

## Synonyms

Business ethics organization; Organization for issues on social responsibility of business; Professional business ethics organization; Social responsibility of business organization

## Definition

This is a brief description of the history of the International Association for Business and Society (IABS).

## Description

The IABS is, according to its website, “a learned society devoted to research and teaching about relationships between business, government and society.” Its field of research is broadly defined as covering “various aspects of the interface between management and the social political dynamics of the surrounding society. It includes, among others, research on corporate social responsibility and performance, emerging social issues for business, business ethics, environmental affairs, and business and government relations.”

The Association was founded in 1990, 30 years after the journal *Business and Society*. Readers of the encyclopedia entry on that journal will find that the general purposes of the IABS are consistent with those of the journal. At this writing (May 2017), the IABS “has over 300 members worldwide from over 100 universities in more than 20 countries as well as members from various corporations and not-for-profit organizations.”

According to the first issue of the IABS newsletter, dated Spring 1992, the first president of the Association was Philip L. Cochran, who was also the editor of the newsletter. He was elected in 1991. The president in 2017 is Colin Higgins.

The second annual general meeting of the IABS was held at Robert Redford’s Sundance Ski Resort in Utah in March 1991. It had “100 attendees from the USA, Canada, and Mexico” and 60 presentations.

## International Consortium of Investigative Journalists (ICIJ)

Alex C. Michalos

University of Northern British Columbia, Ottawa, ON, Canada

## Synonyms

ICIJ; Investigative Journalism; Investigative Journalists; Journalists

## Definition

The mission of the ICIJ is “to bring accountability on a grand scale. . . [by means of] a new kind of scrutiny to world events and complex problems – using data and document-supported facts that cannot easily be dismissed” (ICIJ 2019).

## Description

According to the website of the ICIJ, the group wants “to inspire and cultivate a global community of reporters and readers who believe journalism can bring about positive change.” The nonprofit organization, based in Washington, D.C., includes over “220 of the best investigative reporters from 83 countries and territories” partnered with “more than 100 media organizations.” The latter include distinguished outlets like the BBC, the New York Times, and the Guardian. Using “the enormous strength” of their network’s members in the USA, Australia, France, Costa Rica, Peru, El Salvador, Spain, Italy, Hungary, Germany, Belgium, Ireland, England, and Venezuela, the group wants “to empower our readers to engage with their local communities about issues of global importance, such as broken systems and abuses of power.” ICIJ is “fully funded by donations” and “encourages tips, leaks, and story ideas from the public, whistleblowers, as well as from outstanding investigative journalists.” Besides a steady flow of provocative news reports like the Luxembourg

Leaks, Big 4 Audit Firms Play Big Role in Offshore Murk, EU Unveils Action Plan to Tackle Corporate Tax Dodging, and the Paradise Papers, the ICIJ's most famous report, the Panama Papers, won the Pulitzer Prize for "explanatory reporting" in April 2017.

ICIJ's *Manifesto* boldly asserts that "We believe it is the job of journalists to arm the public with information, to empower citizens to strengthen democratic institutions and democracy itself. We believe that truth is society's best weapon against corruption, injustice, and inequality."

## International Women's Day and Its Role in Women's Rights

Deborah C. Poff  
Brandon University, Ottawa, ON, Canada

## Synonyms

Women's labor rights; Women's political rights;  
Women's rights as human rights

## Introduction

In many countries around the world March 8th is a day to celebrate and honor women. There are often panels which discuss women's status as

persons and celebrate what progress has been achieved with respect to women's status in terms of equality rights. There are also often marches and parades and sometimes serious assessments of how far women have come with respect to equal access to human rights and to equal protection of labor rights and other rights under the law. It is also a day of deliberation about what inequality issues continue to discriminate against women based on sex and gender.

## International Women's Day: Its Establishment and Beginning

This article will give the short history on the establishment of International Women's Day in the twentieth century and look at the precipitating factors that led to protests, mobilization, and political action throughout the early part of the twentieth century.

Many women (and men) in different countries celebrate International Women's Day (IWD) on March 8th every year. Some nations have declared IWD a national holiday. In 1975, the United Nations declared that it was the UN year of women and has monitored successes and lack of success for women's equality systematically since then. But while the day is celebrated in many nations, the history of the day is not always noted, nor is history always shared about how embedded its origins were in the labor and socialist movements of the early twentieth century. The 1975 onward celebration is often embraced by corporations and workplaces but often in a depoliticized way that detaches the celebration from its historical roots.

The United Nations has been deeply involved in tracking and promoting women's rights at least since the Universal Declaration of Human Rights which was ratified by the United Nations on December 10, 1948. Consequently, many of the sources for this article are United Nations' sources. The most important claim for women as persons granted human rights is based on the declaration statements of universality of rights for all human beings. In particular, Article 2 states:

Everyone is entitled to all the rights and freedoms set forth in this Declaration, without distinction of any kind, such as, race, colour, sex, language, religion, political or other opinion, national or social origin, property, birth or other status.

There are also articles which specifically reference women – again stressing not only equality but the right not to be discriminated against because of change in status due to widowhood, rights related to reproductive rights for women and equality in the right to own property.

### **Early Twentieth-Century Protests by Women for Better Working Conditions**

As noted by Haynes (2019), “the impetus for establishing an International Women’s Day can be traced back to New York City in February 1908, when thousands of women who were garment workers went on strike and marched through the city to protest against their working conditions.” This was followed in 1909 by a National Women’s Day in the USA celebrated through a declaration by the Socialist Party of America.

During this period, particularly in the textile industry in Britain, Europe, and the USA, conditions were hazardous and hours were long. Women and girls were often the majority of these workers who “sweated” under harsh working conditions for very long hours and very little pay.

No better example during this period was the 1911 Triangle Shirtwaist Fire in which 146 girls and women died either in a horrendous fire or jumped to the deaths from the 8th floor of the locked building from which they could not escape. As van Drehle describes the horror of that day:

[Women] were trapped by flames, a collapsed fire escape and a locked door. Firefighters frantically cranked a rescue ladder, which rose slowly skyward – then stopped at the sixth floor, fully extended. Pressed by the advancing blaze, workers began leaping and tumbling to their deaths on the sidewalk. Other workers perished in the flames, still others plunged into an open elevator shaft, while behind the factory two dozen fell from the flimsy fire escape.

Such conditions were common to all sweating employment which generally involved low-level piece work which either was done at the location of the employer or as domestic home labor. Both types of piece work resulted in barely livable wages. This was also a period where women were actively campaigning for the right to vote and the right for education. The consequence of this period of unrest was a series of protests, declarations, and establishment of political and labor organizations that marked the initial events in collective demands for women’s rights.

The United Nations in its profiling of the history of the IWD focuses on particular events in the establishment of March 8th as IWD. As noted above, the USA held the first National Women’s Day in 1909 in recognition of the women garment workers protest in the streets of New York in the previous year.

In 1910, the United Nations states of the establishment of International Women’s Day:

A second International Conference of Working Women was held in Copenhagen... Clara Zetkin (Leader of the Women’s Office for the Social Democratic Party in Germany) tabled the idea of an International Women’s Day... The conference of over 100 women from 17 countries, representing unions, socialist parties, working women’s clubs – and including the first three women elected to the Finnish parliament – greeted Zetkin’s suggestion with unanimous approval and thus International Women’s Day was the result. (<https://www.internationalwomensday.com/About>)

IWD continued to grow across different countries and was a catalyst for women to work for the vote as well as peace prior to and through the First World War. Perhaps the most significant event in the establishment of the importance of women’s rights occurred in Russia in 1917 when women chose the day to strike for bread and peace. As noted in the UN document quoted above on the history of International Women’s Day, the success of the strike was remarkable in Russian history. Four days after the strike “the Czar was forced to abdicate and the provisional government granted women the right to vote.”

## Women's Status Now

Women have made progress, particularly in western democratic nation-states. While there is not wage parity between women and men, the wage gap has been significantly closed in the past few decades with many countries where the average salary for women is approximately 82–85% of the average salary for men. In Canada, that is substantial improvement from the 1970 wage gap of 59 cents for every dollar earned by a man when the Royal Commission on the Status of Women in Canada was tabled in parliament. Looking at OECD countries, the overall gap in wages between women and men is 12.9, while in the USA this gap is at 18.5.

However, despite some gains towards pay equity, in many parts of the world there continues to be unequal status between men and women across many domains. As Poff (2017) notes with respect to women and wealth equity:

A major barrier to any consideration of wealth equity for women is women's unequal access to assets compared to men, including the ability or inability to own and acquire property either through employment or through inheritance or through marriage in many parts of the world.

As noted above, the UN established the United Nations Year of the Woman in 1975 and have monitored women's equality issues since then. While some success has been achieved, Poff notes that:

the resilience of cultural difference and its alliance with some regressive religious factions within many world faiths has been particularly successful in resisting the adoption and implementation of laws, of education, concerning the rights of women, on access to education, on employment and on the right to acquire and control assets. These factors may play the most important role of any in denying basic human rights for girls and women in many countries in the world.

So, while much has been accomplished, much is left to do.

## Intersection of Indigenous Values and Ethical Leadership

Maree Roche<sup>1</sup> and Jarrod Haar<sup>2</sup>

<sup>1</sup>Leadership Unit, Waikato Management School, University of Waikato, Hamilton, New Zealand

<sup>2</sup>School of Business, Auckland University of Technology, Auckland, New Zealand

## Synonyms

Ethical leadership; Maori values

## Introduction

...sometimes we have to recognise the signposts of humanity... and I think we've been trying to create a new type of humanity... (leader one, interview one)

Rising interest in the role of ethical leadership and organizational and individual attitudes and behaviors attests to the importance of leadership in navigating today's complex and uncertain world. Researchers Brown et al. (2005, p. 117) state "leaders should be a key source of ethical guidance for employees" and note the importance of studying and understanding the ethical conduct of leaders because employees look to leaders for ethical guidance. Consequently, leaders' ethical values and conduct are important in a workplace context. Ethical leadership has been found to enhance firm performance followers in role performance (Bouckennooghe et al. 2015), follower voice, and ethical behavior within an organization, and corporate social responsibility. Clearly while some argue the concept of ethical leadership and research remain nascent, ethical leadership is important in harnessing business and professional standards. Others note that ethical leadership differs from other leadership approaches as it draws heavily on social learning theory, which highlights that people learn from modeling the behavior of role models in this case ethical leaders. As such, leaders' efforts aimed at modeling their own ethical behavior drawn from their own values, influence followers in an ethical manner (Brown and Treviño 2006).

While this dialogue is interesting, missing for the literature is the role of indigenous cultural values that can serve as antecedents, in the development of ethical leadership (Haar et al. 2019). Ultimately, the research by Haar et al. (2019) enhanced understanding of ethical leadership by examining five indigenous cultural values as antecedents of ethical leadership. The above research uses a mixed method approach that includes a unique study design of Kaupapa Māori research methodology (Smith 1999), and statistical analysis, specifically structural equation modelling (SEM), to provide insight into the unique antecedents and outcomes of ethical leadership, built on indigenous perspectives. This is separated into two studies, expanded below.

## Indigenous Values and Ethical Leadership

Initially exploratory Kaupapa Māori research (Smith 1999) methods were employed – as this research process reflects those undertaken on Māori leaders. Smith argues Kaupapa Māori research provides a focus through which Māori people (researchers and the researched) engage in research that empowers, is open to alternative (Māori) world views, is connected to Māori philosophy and principles, and assumes validity and legitimacy of Māori culture. As such, interviews with Māori leaders sought to understand what *unique* leadership characteristics exist within Māori leadership practices. This is described in the section "[Kaupapa Māori Research](#)." In the section "[Ethical Leadership and Outcomes](#)," the findings are utilized to hypothesize an additional study where the unique characteristics found via Māori leaders' interviews are tested towards understanding ethical leadership styles and ultimately employees' well-being.

## Kaupapa Māori Research

For study one, leaders were selected from a consensus of nominations via a panel of Māori experts who reflected the diversity of leadership roles, the variation of leadership position, and range of tribal areas (iwi's) throughout Aotearoa (New Zealand). This sample included leaders from business, political, community, and marae leadership positions. In total, 22 leaders were interviewed (12 male and 10 female) in face-to-face semi-structured interviews, to allow for multiple topics and concepts to be explored in detail (Smith and Eatough 2006).

*Analysis:* All interviews were subject to interpretative phenomenological analytic (IPA) techniques. This method was used as it encourages participants to make sense of their personal world and is particularly useful for complex and unique topics. This can capture the depth of an individual leader's experience and add insight into the understanding of how participants (in this case leaders) have made sense of that experience (Smith 2004).

A two-stage process of interpretation was used: (1) an initial thematic analysis that was organized into major and generalized themes and (2) a more detailed thematic analysis. These themes were cross-referenced back to the data and then reverified by Māori researchers (see Haar et al. 2019). The processes also ensured the connection with Māori tikanga (knowledge and customs) were made.

## Study One Results

Overall five overarching themes that Māori leaders referred to in interviews that reflected their leadership values and philosophies: (1) humility, (2) altruism, (3) time orientation, (4) collectivistic/relational orientation, and (5) cultural authenticity (see Haar et al. 2019). The first theme to emerge from leaders' stories was the concept of *Whakaiti* which relates to being humble and self-disciplined and doing so has an impact on the larger group. This is a virtue that is much admired, and it can attract respect. See Table 1 for demonstrated excerpts. Overall, drawing on *whakaiti*, this finding was termed **humility** for ease of translation.

The second theme found was one of giving to develop the goodwill of others, generosity, giving for long-term or future benefit, and taking care of others. Leaders voiced elements of *manaakitanga* (which is the importance of caring for another person, doing the right thing for them, and ensuring their well-being). Further themes and findings are reflected in the Māori concepts of *ngakau* and *ko tau rourou* and *manaakitanga*. *Ngakau* can be described as generosity of spirit. *Ko tau rourou* reflects this, but has another dimension to it, in that the offering to others assists them in terms of creating a sense of wealth (usually nonmaterial). Essentially, this was grouped as a form of cooperation to enable betterment and developed via giving. Combined, this reflects **altruism**. Table 1 provides quotes encapsulating Māori leaders' stories towards altruism.

While widely accepted in Māori literature (see Roche et al. 2018), there was evidence of the

cultural value of **collectivism** being another key driver of leaders' values and philosophies. For Māori leaders, however, this was woven in among notions of *whakapapa*, *whānau*, and *whanaungatanga*. *Whakapapa* includes being able to relate to people with whom a common ancestry is shared and relates to maintaining this sense of shared history and community. *Whānau* relates to the extended, intergenerational family, and many decisions are around the implications of these towards whānau. Some note that whānau is not a simple "alternative" term for the nuclear family, as this fails to recognize the vastly different structure for Māori and importance of whānau, which may include intergenerational family structures, possible foster-relationships and other family and community connections and obligations (Roche et al. 2018; Haar et al. 2019). *Whanaungatanga* refers to inter-relationships and considers processes, the rituals of encounter both formal and informal as well as wider networks (Haar et al. 2019). See Table 1 for demonstrative quotes of this value.

The fourth theme was related to long-term **time orientations** of leaders and concepts such as a long journey or a long time. While direct translations are difficult, stories reflect the notion of *kaitiakitanga* which refers to the need for a long-term orientation towards sustainability of people, culture, and the environment. This is long-term orientation/value in relation to guardianship and protection. Māori hold a great connection to past generations, environmental preservation, and care for the collective future (Hook 2007). See Table 1 for additional quotes.

The final dimension discussed is that of **cultural authenticity**, which related to feeling at ease in the Māori world, the value of one's culture and importance of knowing and living this. The notion of *tikanga* was found to be particularly important in relation to Māori leaders' authenticity. Again, while this has a wide range of meanings, including the understanding and adhering to culture, custom, ethics, etiquette, protocol, and style, it generally is taken to mean "the Māori way of doing things," and it is derived from the Māori word *tika* meaning "right" or "correct." Thus, *tikanga* can

| <b>Collectivistic/relational orientation</b> | <p>Leader 2 (male) “. . . I think one of the things [is] whanaungatanga. So I work at my relationships personally and professionally, they are all the same, all of us need to be working together, developing this together . . .”</p> <p>Leader 15 (male) “. . . relationship building, it’s all about relationship building. Believe it or not, there’s nothing . . . without relationships. And they could be a person already known, or they could be just a piece of paper that signs you have an MOU with them . . . but they all matter . . . and I would never devalue that. . .”</p> <p>Leader 21 (male) “. . . but I find that you need to go that extra mile to make that relationship a little bit stronger . . .”</p>                                                                  |
| <b>Time orientation</b>                      | <p>Leader 4 (female) “. . . really, it will be when the next three – maybe four or five – generations look back on what we are doing, that it will really count as any sort of success . . .”</p> <p>Leader 15 (male) “. . . we’re not dealing in 3–5 years . . . for us it’s hundreds . . . a thousand years. . . that is where the difference will be known. . .”</p>                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Cultural authenticity</b>                 | <p>Leader 14 (male) “. . . to be quite clear about our approach . . . It is to be consistent about how you communicate and how you are always accountable. . . and that’s really about the values that support us in our view of the world – its tikanga, manaakitanga and the like . . . It’s managing the aspirations, the needs, the wants, the hopes of people that you represent and I’m not just talking about Uri, I’m talking all interactions, they are clear, accountable and based on the values we hold tightly . . .”</p> <p>Leader 5 (female) “. . . you have to have that cultural knowledge. If you don’t have that cultural knowledge you’re going to just set yourself up to fail. And I think that strong cultural knowledge provides me with the strength of who I am . . .”</p> |
| <b>Ethical leadership</b>                    | <p>“. . . I won’t be part of something that is not real, honest and up front . . . that is not developing changes needed for us . . . no ticking a box just because . . .”</p> <p>“. . . sometimes we have to recognise the signposts of humanity . . . and I think I’ve been trying to create a new type of humanity. . .”</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

relate to Māori traditional rules and culture as well as rules for conducting life. This theme is woven in with wider literature on authenticity: the importance of knowing oneself and expressing oneself in ways that are consistent with inner thoughts and feelings. See Table 1 for quotes of cultural authenticity.

Overall, these five dimensions proved to be significant in terms of Māori leaders’ values,

and, as far as the authors are aware, the combination of all five, as antecedent to leadership literature is novel. Before embarking on the second stage of the study, “touchpoints” with Māori leaders values, and Western conceptualizations and measures were made. Section “[Ethical Leadership and Outcomes](#)” focuses on the influence of these five values (using touchpoints between Kaupapa world views and Western measures)

towards ethical leadership perceptions by employees. It is worth noting that ethical leadership is used in this study because it was also raised by Māori leaders in the interviews as central (see Table 1).

## Ethical Leadership and Outcomes

Ethical leadership can be defined as the “demonstration of normatively appropriate conduct through personal actions and interpersonal relationships, and the promotion of such conduct to followers through two-way communication, reinforcement, and decision-making” (Brown et al. 2005, p. 120). Although the construct of ethical leadership is relatively new (Palanski et al. 2014), research is beginning to show the importance of ethical leadership for application in organizations (Palanski et al. 2014). Past research has found that ethical leadership is “related to consideration behavior, honesty, trust in the leader, interactional fairness, socialized charismatic leadership (Brown et al. 2005, p. 117), and can be perceived by followers as an effective leadership strategy enabling followers’ job satisfaction and dedication, and their willingness to report problems to management (see Brown et al. 2005). Mihelc et al. (2010) summarize ethical leaders as those who think about long-term consequences, drawbacks, and benefits of the decisions they make in the organization.

Given the strength of Māori leaders’ values, findings supported the five values of Māori leaders being related to follower perceptions of ethical leadership and ultimately (in a third study) employee work-life balance, job satisfaction, and turnover intentions. In part two, 249 respondents who represented a broad sample of all New Zealand workers were surveyed. Ultimately, all five antecedents positively related to ethical leadership perceptions. These findings provide support for the five indigenous values as not only important for Māori leadership but also for ethical leadership perceptions. In a third study, the 249 respondents were resurveyed and asked about their job satisfaction, work-life balance, and turnover intentions. In total, 122 respondents took part

in this section of the study. Using SEM in AMOS again findings demonstrated that the path to employee well-being was through ethical leadership, but firstly Maori leadership values as antecedents.

## Conclusion

Over three studies, the centrality and importance of indigenous values towards ethical leadership and employee well-being was evidenced. The present study extends understanding of ethical leadership by including the five unique antecedents (developed from “touchpoints” with Māori leaders’ values and stories), then also determining these as a path towards positive leadership behavior, namely ethical leadership.

## Investor Response to the Climate Change Challenge

Cary Krosinsky  
Yale School of Management and Yale College,  
Yale University, New Haven, CT, USA  
Brown University, Providence, RI, USA

### Synonyms

Environmental investing; Impact investing;  
Sustainable investing

### Introduction

Investors increasingly are considering climate change and their decision-making, moving from

negative approaches which at best met market performance to positive strategies that seek to solve problems while maximizing financial value. A top-down, bottom-up race is underway seeking best solutions to growing interest in the subject from millennials and other demographics seeking to make better connections between the futures they desire and the outcomes of their investment choices.

### Looking Back, Looking Forward

In 2018, with the expected effects of climate change looming on the not too distant horizon, investors are rapidly increasing their attempts to integrate these considerations into their investment processes. What to do about this, and how to do it, is perhaps best informed by a brief look back to past work on this topic.

In 2008, we drew a line in the sand with the publication of *Sustainable Investing: The Art of Long-Term Performance* (Earthscan 2008), discussing how companies and investors were beginning to look forward and see the opportunities that were emerging from sensibly addressing climate risk. In 2012 *Evolutions in Sustainable Investing* (Wiley 2012) provided a “big umbrella” look at how investors were more specifically addressing ESG issues through their varying strategies. This volume highlighted 15 case studies alongside thought leadership from experts such as Paul Hawken, Dan Esty, and Rory Sullivan, as well as a series of global and asset class perspectives. This volume explored the issues of sustainable investing as the field continued to evolve post the 2008 financial crisis.

Fast forward to December 2015, a third volume on this important topic, *Sustainable Investing: Revolutions in Theory and Practice* (Routledge 2017) offered a look forward at what the next 5–10 years of investing should look like. This book describes the full gamut of investment strategies being used by investors across value first vs. values first investing, making the overarching case for a parallel approach of seeking better sustainability and financial outcomes. It suggests that the system cannot support one without the

other; hence, investment strategies which outperform are optimal for solving for climate and impact considerations.

### Brown University Shows the Way

Much of the thinking in *Sustainable Investing: Revolutions in Theory and Practice* has been informed by insights gained through work with Brown University's investment office and a course taught at Brown University inspired by then senior student Sophie Purdom, whose work led the charge on this topic. As an intern in the Investment Office, she helped develop the 2016 Theory and Practice of Sustainable Investing class taught together with the author of this article. She helped launch the Brown University Sustainable Investment Fund within the Brown Endowment as a new option for donors. Purdom's work demonstrates the power that one person can achieve and demonstrates the important leadership that is forthcoming and developing among young women in this field. Gender and investing have emerged as a recent theme in sustainable investing and should be considered part of ESG Integration, as another distinct investment strategy, linked to better financial performance. *Sustainable Investing: Revolutions in Theory and Practice* describes "the 7 Tribes of Sustainable Investing" that includes the three themes above together with thematic investment, impact investment, shareholder engagement, and minimum standards. The volume goes into depth on the opportunities and challenges within each of these strands of activity.

### Climate Change and Asset Owners

One important aspect of sustainable investing is our understanding of tradeable assets more generally, which are worth US\$450 trillion, an amount detailed in the paper "*The Value of Everything*" written for the UNEP Inquiry into the Design of a Sustainable Financial System (Krosinsky 2015). Half of this amount is institutionally managed or controlled and is more than is typically cited.

Altering these assets toward the necessary low carbon transition remains mission critical for solving the climate-related problems before us. It has been suggested that new commitments toward this transition from large asset owners such as New York State Common Retirement or PGGM in the Netherlands and similar, as well as commitments from large institutions such as Goldman Sachs and Bank of America Merrill Lynch, are required (*Sustainable Trillion*). Bank of America Merrill Lynch and BlackRock each cite over US\$10B in new allocations to sustainable and impact investing in 2016 over a 1-year period, each exceeding their previous expectations.

But the current US\$1–2 trillion of ESG investment needs to become at least US\$50 trillion. *Sustainable Investing: Revolutions in Theory and Practice* (Routledge 2017) provides a Climate Change Asset Owner Framework that details how such a shift can occur. This framework was released during COP 21 in the late 2015 by the Principles for Responsible Investment (PRI), as the outcome the PRI Working Group involving some of the larger PRI signatories including AXA, Allianz, and Aegon among others. This framework calls for more commitments to sustainable investing in solutions across asset class, engagement in three ways – with companies, policymakers, and outsourced fund managers – and selling after engagement fails or the business case disappears. Norges Bank is perhaps the best example of a large institution which performs at least the last two of these steps, having a deeply embedded process for engagement and selling when not seeing a result, well documented at their website. While Norges Bank could do more on the solutions front in some asset classes, their growing efforts at sustainable real estate are well documented (Wright 2017). With ambitions to grow from a 0% allocation to 5–10%, this new endeavor shows how it is in many ways easier to invest in a sustainable manner from scratch rather than altering existing allocations.

Such strategies can be described as a "top-down, bottom-up" race. A number of new initiatives that are fostered by the likes of BlueSky Investment Management, Terra Alpha, and Mirova, the sustainable investing arm of France-

based Natixis Investment Management who has been catalyzing leading work under the leadership of Philippe Zaouati, now have a beachhead in the USA. European investors have been encouraged to come over to the USA with their more mature strategies for sustainable investing, and it is gratifying to see this occurring. It is hoped that this move will catalyze more US-based investors to build new strategies from scratch which is now starting to happen.

Data, while challenged for comprehensiveness and quality (Esty and Cort 2017), has become a key focus with MSCI and Sustainalytics both reporting record levels of interest. The acquisition of Trucost by S&P also heralds increasing success in the data field. The Task Force for Climate-Related Financial Disclosures (TCFD) was chaired by Mike Bloomberg. BlackRock and others have rallied around this initiative to encourage companies to increase their climate-related reporting. BlackRock also now has over 30 staff globally engaging with companies directly and has made clear in 2017 that they will push back hard on this issue with management.

We also need to be realistic about what needs to be done in the energy sector. Carbon emissions, roughly 50 Gt per year in carbon dioxide equivalents, come about as the output of consumption across the five categories of the global economy. The largest of these categories are electricity generation, transportation, and buildings, and given the interconnections between these areas, decarbonizing these together represents the largest opportunity to find reductions. *Sustainable Investing: Revolutions in Theory and Practice* (Routledge 2017) goes over this in depth as well as what is possible within what has been called industrial ecology or more frequently now known as the circular economy, as well as within agriculture and deforestation.

Investing requires ecosystems of expertise, and to make investing sustainable requires further ecosystems to develop. This is a nascent area of work of the aforementioned UNEP Inquiry and an important area of work now being scaled in cities such as Milan and Tokyo with more to follow soon (Robins 2017). China is also accelerating its efforts and is now the world's leading investor

in renewable energy. Similar efforts in India are also increasing (Ibid).

Fiduciary duty is another important consideration as well in the realm of climate risk. Fiduciary duty historically looks at the Duties of Prudence (doing what is best for ones beneficiaries) and Loyalty (avoiding conflicts of interest). It is anticipated that soon the reverse of previous assumptions will hold true, namely, that it will be against fiduciary duty not to consider climate risks in investment portfolios (Viederman 2011).

Risk management itself is also evolving. In the past financial markets and science look separately at risk categories. But how can these fields coalesce into one common framework (Krosinsky Purdom 2017)? Value is increasingly driven by better risk management, as well as increasing revenue from sustainability-advantaged products and services and greater savings from efforts such as energy efficiency and managing human capital. These are often benefiting companies strategically and materially, in the billions of dollars, representing meaningful percentages of growth, productivity, and risk, and companies in these areas have financially outperformed (Lubin 2017).

New business models are also emerging such as B Corporations, Benefit Corps, and Conscious Investors to name just three, and better managing of climate risk, especially as it helps enable the necessary low carbon transition in conjunction with achieving positive impact, forms a nexus of future opportunity that needs encouraging and scaling.

New business models can be old as well, with the rise of the so-called sharing economy and concepts of shared value actually having their roots in shared ownership. Well before Islamic finance called for fixed income to be prohibited, the roots of finance considered that if you wanted to lend money to a project, you should take on partial ownership as well. This is a formula for success, if insiders, founding investors, and employees all own a stake in a company or invested project, whereby all have a stake in the eventual outcomes and the future.

Looking forward to the future of innovation and investing, we need all to participate including

investment consultants who had long been on the sidelines of sustainable investing and are now involved at least in some ways in responding to the increasing requests of investors who want to make better connections between their dollars and outcomes. Also working hard on the future of investment is the Principles for Responsible Investment (PRI) that now represents over US\$60 trillion of assets.

Solving for climate change, and impact more generally, will take the simultaneous efforts of hundreds of strategies being deployed for success. Think of China, which will need more renewable energy, less pollution, cleaner water, water for producing energy, better means of producing food, enforcement of regulation, better electricity distribution, more innovation and the development of a responsible investment culture of its own, and much more. This then is also needed in India. The three largest global economies are China, the USA, and the European Union, and the economic race is now also a race to global competitiveness through being able to adapt and solve for climate change and its interconnected effects. Solving for climate makes economies more competitive, less risky, and is arguably now table stakes for the future of economic success.

### Corporates and Investors Moving Forward Together

Companies themselves increasingly see this, and there is a perfect parallel between well-run companies, sustainability management, and financial success, exactly what you would want to see. This can perhaps be best seen by the likes of the Parnassus Endeavor Fund, which has grown to manage US\$3.7 billion through becoming the #1 Large Cap Growth Fund in the USA, regardless of sustainability in 2016. This fund is also the outperforming sustainable investment fund over the last 1, 3, 5, and 10 years and merely invests in the best companies to work for. The fund was not invested in fossil fuel producers originally

as an outcome of its investment process and has since labeled itself “fossil fuel free,” making it an interesting case of what we call Smart Divestment. Divestment or negative screening as a primary strategy most often has led to financial underperformance; instead divestment can be the result of a thoughtful investment process which can result in better financial performance as is the case with endeavor.

It is important that investments that recognize both risk and opportunity in our shift to a low-carbon economy can financially outperform with a sustainability approach. In fact, this may become the future of active management more generally. In an age where active fund managers often underperform their benchmarks in the USA, in the UK, in Canada, and beyond, sustainable investing not only can be but must be the future of investing.

## Islam and Business Ethics

Abdul Karim Aldohni  
Newcastle Law School, Newcastle University,  
Newcastle, UK

### Synonyms

Faith and finance

### Introduction

Islamic law (Sharia) is believed to provide a system of life, where its rules and instructions create a comprehensive code of governance in order for believers to succeed in this life and the Hereafter. On the one hand, it has a spiritual aspect “*ibadat*,” which focuses on the relation with the creator and the elevation of the soul. On the other hand, it also has a practical or material aspect “*muamalat*” that governs individuals’ interaction including their financial and commercial affairs. These two dimensions are intertwined and complement each other. Worshiping as an act of obedience to God is not limited to the religious rituals as individuals are reminded to worship God and observe Him in all their materialistic interactions “*muamalat*” by following His governing rules in relation to these affairs. This is considered one of the effective ways to create a stronger bond with (Allah) God (Aldohni 2015).

This governance code, Sharia, consists of textual sources the Quran and the Sunnah. The former is believed to be the words of (Allah) God revealed to His last messenger the Prophet Mohammed, while the latter encompasses all the Prophet’s actions, statements, and tacit approval as narrated by his companions and recorded by their followers. Further, it has a set of secondary sources that require the intellectual contribution of Muslim jurists to interpret the application of the textual sources. Therefore, although Islam’s governance code is in its essence monotheistic, human reasoning plays a major role in advancing its divine-based sources and ensuring the

continuous application of its rules and instructions (Aldohni 2020).

### Business and Professional Ethics in the Context of Islam

Business and commerce have particular importance to Islam as a religion; however, this is not to suggest that the religion’s quest is materialistic rather than spiritual. On the contrary, Islam understands the fact that materialism is part of human nature; therefore, it uses this fact in advancing the spiritual being of humans without depriving them of their materialistic needs.

In advancing its ethical commands and teachings Islamic governance, Sharia, uses terms that resonate with the materialistic nature of humans. For instance, in encouraging people to follow the commands of Allah the Quran warns the misguided “. . .who trade guidance with misguidance” that “. . .this trade is profitless” (the Quran 2:16). Also, the Quran describes spending for the sake of Allah, i.e., for charitable causes, as a “trade that will save you [believers] from a painful punishment” (the Quran 61:10) and those “who donate from what We [Allah] have provided for them – secretly and openly [can] hope for a trade that will never fail” (the Quran 35:29). Further, the Quran describes the act of those who spend for the sake of Allah as lending to Allah “a benevolent loan that Allah will multiply many times over” (the Quran 2:245).

While Islam clearly understands the importance of the materialistic needs of humans, it ensures that these needs are catered for through an ethical framework that redefines some key concepts in this context.

### The Reconceptualization of Ownership

Central to the Islamic belief is the concept of “*khilafah*,” which means that human beings are God’s vicegerents and they are entrusted with the earth (the Quran 6:165). Despite the simple premise of this concept, its social, economic, and environmental implications are significant.

The concept of *khilafah* establishes that God (Allah) is the ultimate owner of all resources and

wealth, and humans are God's trustees, which makes them accountable to God regarding the use of the wealth and resources conferred upon them by this trust (the Quran 10:14). In this respect, there is a delicate balance that needs to be struck. On the one hand, as God's vicegerent, each human is encouraged to benefit themselves and advance their economic gains (the Quran 67:15). On the other hand, while advancing their own interests humans are reminded that earth and all its resources are for the benefits of all humans (the Quran 2:29). Further, God's entrusted resources and wealth must not be wasted or destroyed (the Quran 7:56). It is the type of actions that falls within the prohibited act of spreading *fasad* (corruption – viciousness) (Chapra 1995, p. 207), which applies equally in the environmental and socioeconomic contexts.

First, the planetary boundaries should be respected in order to allow all humans – present and future – to enjoy these natural resources. Therefore, individuals and their businesses are responsible for protecting the environment and ensuring that they are limiting any damages carried out by their business activities. Second, “*khilafah*” in Islamic governance has a clear connotation of collective responsibility (the Quran 10:14) that extends beyond the protection of natural resources. Accordingly, the individual's use of his/her wealth and properties is restrained by the mutual responsibility owed by each individual toward their fellow human. This has been envisaged as a brotherhood bond that prevents an individual from purely optimizing his/her self-interest without helping to fulfill the needs of others (Chapra 1995, pp. 206–207; Anjum 1996, p. 61).

Therefore, being a vicegerent of God enhances the sense of societal responsibility while advancing economic gains (Alsader 1987, pp. 534–536). This should ensure that all economic functions of human beings have social solidarity and cooperation as essential features. This sense of societal responsibility is empowered by individuals' spiritual commitment to please God. Islamic governance makes it clear that the most favored human being to God is the most helpful to his/her fellow humans (Prophetic Sunnah, Sahih Muslim and the Quran 49:13). In this regard, businesses and

corporations owe a duty of care to the community they operate within. This community is not limited only to those who work for them but also includes the wider society they interact with in the course of their business.

### The Professional Ethics of Trade and Finance

Before looking at the operational aspect of trade and finance from an Islamic professional ethics perspective, it is important to note that the impact of the concept of “*khilafah*” should be also found in the allocation of resources in the context of trade and finance. There is a “moral filter” (Rice 1999) that governs the way in which individuals decide to invest in trade and finance business ventures. While making these business and finance decisions individuals should be always reminded of their environmental, societal, and economic commitments and duties.

From an operational point of view, sacredness of the contract is at the essence of Islamic ethics in relation to trade and finance. The Quran states God's (Allah) decisive order to the believers to fulfill their contractual commitments (the Quran 5:1). Further, fulfilling contractual commitments has been described among the other good deeds that denote piety (the Quran 2:177). Accordingly, in order for a contract to benefit from this status it should not include any prohibited elements, which could concern the object of the contract or its terms and conditions.

As for the former, there are certain prohibitions that Sharia instates; therefore, they cannot be a valid object of a contract, such as alcohol and gambling. The prohibition of such objects has an ethical dimension where the damages to individuals' well-being outweigh any benefits that individuals might gain (the Quran 2:219 & 5:90).

With regard to the prohibited terms, Islamic governance prohibits the inclusion of certain terms in the contract that accommodate for forbidden elements, key in this respect are *riba* and *gharar*.

First, *riba* encompasses the concept of conventional interest as it includes any increase to the capital lent as a compensation for time deferment. In addition to the ethical concern of the potential for exploitation by the more financially able, the

prohibition of interest primarily stems from the Islamic view of money. Islamic governance does not consider money as a commodity that can be traded with to generate income in the form of interest. Rather it is a means of exchange with no productive capacity and it should be used to obtain property rights while combining capital and labor (Aldohni 2020, pp. 491, 496). Therefore, any legitimate profits should be the result of sharing not only the profits but also the risks of losses associated with any transaction, which makes the mechanism of trade central to this equation (the Quran 2:275). The majority of Islamic finance products are designed to ensure that those who are providing the finance are taking a stake in the business venture they are financing, which means the return of their capital, and any legitimate income, is not guaranteed.

Second, the concept of *gharar* encompasses speculation, uncertainty, and high risk and its prohibition originated from the prohibition of gambling. A contract that involves the element of *gharar* is a contract where one of the parties' interest will be jeopardized and accordingly their property will be consumed unjustly by the other party, which is prohibited (the Quran 4:29). For example, option contracts – call and put options – are prohibited because the contract is dependent on an uncertain event that may or may not happen. *Gharar* also extends to include uncertainty of the object in a contract.

Finally, complying with the professional business ethics of Islam is essential to ensure earning legitimate profits. However, the ethical duties of individuals do not end once the benefits have been reaped. In addition to constantly reminding individuals of voluntary charitable giving and its benefits in this life and the Hereafter (some examples from the Quran can be seen in verses 2:177, 2:215, 2:254, 2:261, 2:262, 3:92, 59:7 and 63:10),

Islamic governance establishes a compulsory wealth redistribution scheme, known as *Zakat*. It is one of the five pillars of the faith; *Zakat*, on the one hand, channels financial help to the most in need in society. On the other hand, it improves the circulation of capital and reduces hoarding, as it is levied on those with idle wealth that surpasses certain benchmarks (Cragg 1956, pp. 151–154).

## Jewish Business Ethics

David Weitzner  
York University, Toronto, ON, Canada

### Synonyms

Halacha; Religious ethics; Spirituality

### Introduction

At its most basic level, Jewish business ethics is an approach to business that turns to the Jewish religious tradition for guidance, leading to definitions like “the interpretation of the written and oral Torah to determine what God commands us to be and to do” (Pava 1998). Other definitions look to incorporate some specifics like “business is seen as a path to sanctity. . . wealth is seen as originating from God, the vulnerable are protected against fraud and theft, charity is seen as an obligation, and mercy towards debtors is tempered by justice” (Tamari 1997). And while these are certainly useful definitions, it is nonetheless important to note that Jewish business ethics is an approach to business that differs from other spiritual traditions in that business activity is viewed as a moral calling in and of itself. A Jewish approach to business ethics is concerned with engaging in business in a way that changes the individual, changes the environment in which that individual works, and

changes all those who come in contact with that individual through their daily business activities. So long as undertaken as a transparent act of good faith, the practice of business can serve both a moral and spiritual purpose.

### Acting in Good Faith

In the Jewish tradition, acting ethically in business has the power to transform both the individual that engages in the practice and the world around them. As such, many of the classic Jewish discussions of good faith business veer considerably far away from the topics that dominate what we generally regard as the sphere of the moral, like altruism and self-sacrifice. Jewish business ethics push for the development of qualities and character traits that do not, at first glance, have overtly moral significance.

Perhaps the clearest example of this is in the speculative Talmudic discussion of the questions asked by the Heavenly Court after death. According to Talmudic mythology, the first of those questions is “Did you do business in good faith?” (Shabbat, 31a). The implication of this revelation is that the Talmudic sages do not criticize business activities in general, or simply delineate a set of rules and prohibitions for all to follow. For the Jewish practitioner, good faith business activities are an essential component in preparing the narrative of their lives. Through this framing, the goal of Jewish business ethics is to help

practitioners create a story of transformation through the seemingly simple acts of good faith business activities.

In this spirit, the Talmudic sages talk glowingly about their biblical forefather Jacob finding favor in the eyes of the local indigenous population through the possibility of three distinct activities: establishing a stable currency for the people, setting up local markets, or building a working public bathhouse. In other words, they viewed establishing currency valuation, markets, and infrastructure as the highest of moral acts. This theme is repeated throughout the Talmud, with the sages going so far as to state that the guide to sainthood is to be found in the study of the tractates on damages – not the lofty esoteric discussions of deep mysticism but the practical exploration of good faith business interactions and transparent compensation.

## Radical Transparency

Jewish business ethics finds great moral worth in transparency and clarity about the nature of the business transaction and the consequences should the transaction go wrong. Considerable space in the Talmud is devoted to discussions outlining the most improbable of scenarios because the more clarity there is in the economic arena, the better markets can function.

To illustrate the great length Talmudic authorities would go to be fully transparent in their business transactions, consider the story of Rav Safra. While deep in prayer, a potential buyer made him an offer. Rav Safra did not immediately respond as his attention in that moment was fully devoted to his religious practice. Mistaking the silence as a rebuffing of the offer, the potential buyer subsequently made a second, higher bid. When Rav Safra concluded his prayers he sold the goods for the first price offered, admitting that had he not been in prayer he would have assented and not sought to bargain (Makkot, 24A).

This commitment to radical transparency in business continued to dominate Jewish thinking on business ethics as the laws were codified by Joseph Karo over a thousand years after the Talmud was compiled. In the Shulchan Arukh, a

work which remains the final word on religious norms in some circles even today, Karo lists among the practices that violate the prohibition of theft those that are considered “theft of knowledge.” These prohibited practices include much of what many today consider to be smart marketing. They include feeding a cow just before a sale to make her look fat, painting old baskets to make them look new, or soaking meat in water to make it look juicy. While contemporary marketing privilege the science of persuasion, Jewish business ethics privileges transparency.

This commitment to transparency extended beyond marketing and into finance. Hillel the Elder instituted the *prozbul* during the Second Temple era, a writ which changed the status of private loans so that they would not be annulled by the Sabbatical year. The intention was to ensure that those with capital would not be discouraged from lending, and that business transactions did not become inadvertent charitable giving due to ambiguity around timing. The *prozbul* exemplifies the need for radical transparency in the realm of lending. The weak need to be protected from exploitation, but the powerful sometimes need protection as well. The Talmudic sages were very careful to ensure that creditors had the same protection as debtors.

## Freeing the Sparks

While there may be rational and pragmatic reason to act in good faith and radical transparency, there is also a mystical branch of Jewish business ethics inspired by Lurianic Kabbalah. At the heart of the Lurianic cosmological myth is the notion that the physical world was born of a primal Divine consciousness thought which was too intense to contain itself and therefore chaotically exploded. In Kabbalistic mythology, these shattered fragments are described as sparks trapped within a shell. The sparks are the Divine meaning of thing, while the shells are the noise and dissonance that shrouds those sparks in our world as a consequence of the violent shattering. A known Kabbalistic metaphor describes our world as taking a book, casting the words and letters into the air, awaiting us to rediscover that meaning (Freeman 2018).

The spiritual work of business practitioners is to see past the shell, discover the spark within, and reconnect the spark to its place in that grand original vision. The Lurianic narrative of releasing the sparks are used to reimagine managerial constructs like the creation of value. By making connections between seemingly disparate parts of our world, business practitioners are capable of creating new value. As individuals connect these fragments in ways that work for themselves and all stakeholders, they are reassembling the world. While this is a moral and spiritual task, those directly involved in its creation are nonetheless entitled to the material benefits of the practice as they redeem the lost sparks.

## John Rawls' Theory of Intergenerational Justice

J. Angelo Corlett  
Philosophy & Ethics, San Diego State University,  
San Diego, CA, USA

## Introduction

In *A Theory of Justice*, John Rawls provides a discussion of “The Problem of Justice Between

Generations” and argues that a proper application of the difference principle would justify a duty of justice from one generation to future ones (Rawls 1999b: 251–258). He is famous for explicating a thought experiment for the fair selection of principles of justice wherein parties in the original position are to situate themselves behind a veil of ignorance wherein they are ignorant of various particulars about themselves such as their own or another’s sexuality, ethnicity, socioeconomic class, etc. in order to select principles of justice in an unbiased manner, principles which would not favor anyone based on such factors and which any reasonable person would follow because they are just and fair. In particular, the difference principle states that “Social and economic inequalities are to arranged so that they are both (a) to the greatest expected benefit of the least advantaged and (b) attached to offices and positions open to all under conditions of fair equality of opportunity” (Rawls 1999b: 72). Proper application of this principle includes the long-range projections of a reasonably just society, or one seeking to become reasonably just. More specifically, he writes: “The appropriate expectation in applying the difference principle is that of the long-term prospects of the least favored over future generations” (Rawls (1999b: 252).

One aspect of the problem of the duty to future generations, Rawls argues, is the devising of a “just savings principle” which would, among other things, explicate the duty of present generations to future generations in terms of “real capital accumulation” (Rawls 1999b: 252). But “How the burden of capital accumulation and of raising the standard of civilization and culture is to be shared between generations seems to admit of no definite answer” (Rawls 1999b: 253). Rawls rejects a utilitarian view which may direct great sacrifices of poorer generations for the sake of future better off ones.

According to a just savings principle, “each generation makes a contribution to those coming later and received from its predecessors” (Rawls 1999b: 254). On the assumption that parties behind the veil of ignorance in the original position care at least about their most immediate descendants and that the just savings principle

adopted therein is such that they wish all earlier generations to have followed it, "the parties are to ask themselves how much they would be willing to save at each stage of advance on the assumption that all other generations have saved, or will save, in accordance with the same criterion" (Rawls 1999b: 255). The just savings principle is primarily a matter of justice, whatever other reasons might support it. In general, Rawls writes: "When people are poor and saving is difficult, a lower rate of saving should be required: whereas in a wealthier society greater savings may reasonably be expected since the real burden of saving is less" (Rawls 1999b: 255).

In thinking thusly, Rawls believes that properly situated parties behind the veil of ignorance in the original position represent present and future generations and that said principle of just savings would be chosen by them and would benefit all generations. "The just savings principle," he writes, "can be regarded as an understanding between generations to carry their fair share of the burden of realizing and preserving a just society" (Rawls 1999b: 257). The "capital" accumulated by the implementation of said principle is described as follows: "The process of accumulation, once it is begun and carried through is to the good of all subsequent generations. Each passes on to the next a fair equivalent in real capital as defined by a just savings principle. (...capital is not only factories and machines, ... but also the knowledge and culture, as well as the techniques and skills, that make possible just institutions and the fair value of liberty)" (Rawls 1999b: 256). In this way, the savings principle represents a commitment of the present generation to uphold its duty to further just institutions (Rawls 1999b: 257). Implied here is the duty to uphold the difference principle such that the present generation would never act in such a manner so as to neglect considerations of future generations and their wellbeing. For Rawls, then, "The life of a people is conceived as a scheme of cooperation spread out in historical time" (Rawls 1999b: 257).

However vital a just savings principle is for Rawlsian justice as fairness, and as true as it is that on Rawls' view "a complete statement of the

difference principle includes the savings principle as a constraint," Rawls is careful to note that the savings principle limits the scope between the Equal Liberties Principle and the difference principle (Rawls 1999b: 257). Because "persons in different generations have duties and obligations to one another just as contemporaries do," the difference principle might be reasonably construed to require that a reasonably just society, whatever it does, must never act unless it creates a net benefit for future generations understood along the following lines: "Saving is achieved by accepting as a political judgment those policies designed to improve the standard of life of later generations of the least advantaged, thereby abstaining from the immediate gains which are available. By supporting these arrangements the required savings can be made, and no representative man in any generation of the most advantaged can complain of another for not doing his part" (Rawls 1999b: 258).

Assuming the plausibility of Rawls' notes on the moral duty to future generations, the following points seem appropriate. In *The Law of Peoples*, Rawls argues in favor of a standard just war theory position that is only justified (*jus ad bellum*) in self-defense, and that *jus in bello* considerations also standardly apply during warfare. He argues that no state has a right to war in mere pursuit of its own rational interest which are not also reasonable, and that there is only a right to war in self-defense in order to protect and preserve its own basic freedoms and constitutional democratic institutions against attack from outlaw states. More specifically, war is never justified to gain economic wealth or natural resources, power, or empire. For such are reasons for outlaw states to go to war. Liberal and decent peoples have a right to go to war in self-defense only because they honor human rights and are nonaggressive. Furthermore, the aim of a just war waged by a well-ordered state is a lasting peace among peoples, including the society against which it goes to war. This is why well-ordered peoples must respect human rights with regard to enemy civilians and soldiers as they too have rights under the Law of Peoples (Rawls 1999a: 89 f.).

Given that estimates of the overall economic costs of the 2003 military invasion and occupation of Iraq and Afghanistan range into the many trillions of US dollars, and in light of the moral facts that said invasion and occupation has been shown to be unjustified on standard just war theoretical grounds (Corlett 2014: Chap. 12), it serves as an example of how the USA failed in its duty of intergenerational justice by wasting such resources which could and should have been used for educational, medical, healthcare, infrastructural, and several other far more important matters. These morally unjust military invasions and occupations have contributed to the ever-increasing national debt of the USA recently estimated to have topped 23 trillion US dollars. Moreover, it would equally obvious that the USA is failing in its duty to future generations insofar as it continues to overpopulate with reckless abandon, contributing massive amounts of environmental pollution in the process (Ehrlich and Ehrlich 1990). These are at least a few examples of contemporary failures to satisfy the duty to future generations in terms of the rights violations of innocent Iraqis and Afghanis attacked, killed or otherwise harmed by said invasions and in terms of economic costs associated with such harms and the understandable ill-will toward the USA and its allies caused by such irresponsible actions by the USA.

While it might be argued that the USA engaged in said invasions precisely in order to protect itself from threats to itself in its well-known preemptive invasion of said states, Rawls himself cautions against such morally irresponsible behavior on the part of outlaw states when he writes: "People must recognize that they cannot make up for the failing to regulate their numbers or to care for their land by conquest in war, or by migrating into another peoples' territory without their consent" (Rawls 1999a: 8).

## John Stuart Mill's Concept of the Harm Principle

Deborah C. Poff

Brandon University, Ottawa, ON, Canada

## Synonyms

Autonomy; Self and duties to others

## Introduction

John Stuart Mill is considered to be one of the most important political philosophers of the nineteenth century who continues to have a significant impact on many contemporary social and political issues. Mill wrote on a broad range of topics but is generally best known for three political, philosophical tracks, namely *Utilitarianism*, *On Liberty*, and *On the Subjection of Women*. Some theorists may contest the importance of the latter text on women but since at least the second wave of the feminist movement it has been considered by many as an important utilitarian and liberal exegetical defense for the equal treatment of women with men. Many scholars note the range of erudition that Mill exhibited in his writings and reference his demanding and rigorous education conducted by his father from his infancy as a foundation for his prolific and profound contribution to moral and political philosophy, albeit a somewhat alienating one devoid of topics related to the emotions and breadth of Romantic contributions to understanding (as Mill noted in his Autobiography).

## Mill's Conception of the Harm Principle

In this article, the focus is on Mill's conception of the harm principle. Mill is claimed by some as a philosophical libertarian and some as a more middle of the road liberal and one test of these divergent interpretations rests on Mill's concept of the harm principle. In essence, it is claimed that the difficulty of definitively operationalizing this concept is one reason for the differences in claims for different ideological understandings of his theory.

In the beginning of his work, *On Liberty*, Mill states (2002, 11),

The object of this essay is to assert one very simple principle, as entitled to govern absolutely the dealings of society with the individual in the way of compulsion and control, whether the means used be physical force in the form of legal penalties, or the moral coercion of public opinion. That principle is, that the sole end for which mankind are warranted, individually or collectively, in interfering with the liberty of action of any of their number, is self-protection. That the only purpose for which power can be rightfully exercised over any member of a civilized community, against his will, is to prevent harm to others. His own good, either physical or moral, is not a sufficient warrant. He cannot rightfully be compelled to do or forbear because it will be better for him to do so, because it will make him happier, because, in the opinion of others, to do so would be wise or even right. There are good reasons for remonstrating with him, or reasoning with him, or persuading him, or entreating him, but not for compelling him or visiting him with any evil in case he do otherwise. To justify that, the conduct from which it is desired to deter him must be calculated to produce evil to someone else. The only part of the conduct of anyone for which he is amenable to society is that which concerns others. In the part which merely concerns himself, his independence, is, of right, absolute. Over himself, over his own body and mind, the individual is sovereign.

While Mill describes the harm principle as "one very simple principle" in this paragraph alone several dense attributions are outlined. First, he states that the only purpose "for which power can be rightly exercised over any member of a civilized community against his will is to prevent harm to others." Mill continues to indicate that this excludes paternalistic interference for an individual's betterment based on others' opinions of what is best for that individual. Only if the

behavior of an individual can be "calculated to produce evil to someone else" is intervention warranted. And, specifically one's domain over oneself is "absolute" and "the individual is sovereign."

Further, Mill goes on to note that this principle goes hand in hand with the principle of utility. He states, "I regard utility as the ultimate appeal of all ethical questions; but it must be utility in the largest sense, grounded in the permanent interests of man as a progressive being." (13) In *Utilitarianism* (Mill 2002, 239), he defines the principle of utility as follows,

Utility, or the Greatest Happiness Principle, holds that actions are right in proportion as they tend to promote happiness, wrong as they tend to produce the opposite of happiness."

While it is beyond the scope of this article to extensively examine the meanings of the utility principle, it is sufficient to note that Mill denies the claims that utilitarianism is hedonistic in nature and affirms that there are higher-order utilities that are for the betterment and happiness of the whole of society. Consistent with this, Mill also elaborates in *On Liberty*, that there are many examples of duties where either the harm to others or the benefit of actions to others can proscribe societal requirements not to act in harmful ways to others or to act in beneficial ways.

The hallmark of the harm principle is the autonomy of the individual where the matters rest in the domain of that individual, such as, freedom of thought and opinion. As an example of this distinction between the autonomy of the individual rather than the domain of any restriction of behavior, Mill argues that holding a belief that is unpopular is clearly a right of the individual but using that belief to incite others to violence is not.

## Criticisms

One of the main criticisms of the harm principle concerns the difficulty in distinguishing the acts that are solely in the domain of the individual self and those that extend to others and may harm

them. Mill distinguished between opinions and acts that might be offensive and those which are reasonably considered harmful to others. A person seemingly has the right to indulge in self-harm through excessive alcohol consumption or drug consumption, for example, but not the right to harm others as a consequence of this behavior. Where offense may be the result, for example, with public displays of drunkenness, disapprobation or social condemnation may be appropriate but not punishment from the state. It is only when harm comes to others, as it does with driving while drunk, that a case can legitimately be made for restrictions on the freedom to drive. The example here is frequently thought to be less than clear as very few examples of self-harm do not have a harmful impact on others (for example, family members or friends of the drunkard or drug addicted). To use another example, in the frequently discussed rights and limitations of those wishing to look at pornography, it is argued that harmful and degrading pictures of certain populations for the enjoyment of others cannot merely be seen as offensive. This debate often hangs on empirical discussions of whether there are causal links between watching pornography and harming members of the population depicted in that pornography.

Another criticism more broadly concerns how the harm principle connects to the utility principle. Mill takes some time in *Utilitarianism* articulating how education leads to an understanding of higher-order sources of happiness and utility which prima facie do not seem evident to some of Mill's critics. How one quantifies happiness with the calculation of the domains of the self and its autonomy and the overall happiness of the greatest number of the members of a society is, it is argued, opaque. The argument comes down to a claim that in many instances liberty and utilitarianism can be at odds.

## Conclusion

Mill made significant and still critically important distinctions between the self and others that continue to inform and demand the prevention of

undue control over the individual's rights to self-determination, freedom of conscience, and freedom of belief that are still the mainstay of democratic societies. That the complexity of determining boundaries between the self and others is just that – complex – does not diminish the importance of the articulation of the harm principle and its relationship to liberty.

## Journal of Business Ethics

Alex C. Michalos<sup>1</sup> and Deborah C. Poff<sup>2,3</sup>

<sup>1</sup>University of Northern British Columbia, Ottawa, ON, Canada

<sup>2</sup>Leading with Integrity, Ottawa, ON, Canada

<sup>3</sup>Brandon University, Ottawa, ON, Canada

## Synonyms

Business ethics journal; Journal on social responsibility of business; Scholarly journal on business ethics

## Definition/Introduction

This is a brief account of the birth and life of the most frequently cited journal in the world devoted to business ethics.

## Description

The first issue of the *Journal of Business Ethics* (jobe) appeared in February, 1982, 77 pages stapled in the center. It was originally intended to be a quarterly, scholarly journal whose basic aim was described in the editor in chief's introductory editorial as providing "a public forum for discussion and debate of ethical issues related to business" (Michalos 1982). For purposes of the journal, "business" was defined "in a broad sense to include all systems involved in the exchange of goods and services," and "ethics" was "interpreted broadly to include all human action aimed at securing a good life." It was assumed that a good life would be a life generally assessed as good from a moral point of view or simply as morally good. After some time, some people apparently had problems with this terminology, and the field of research identified in jobe came to be called the "social responsibility of business" or even only the "responsibility of business."

The idea for the journal occurred to Michalos sometime in 1981 at about 3 a.m., lying awake in a hotel bed following a conference on something or other related to business ethics. He had been working in the field of social indicators research or what is now more often called "quality of life research" for some years and had founded and edited the journal *Social Indicators Research* in 1973. In that field there was considerable interest in corporate social auditing and quality of work life, enough interest that he suddenly suspected would sustain a new journal. As soon as he got home, he wrote a proposal and sent it to a colleague at Riedel, the publisher of *Social Indicators Research*. The publisher went for it; Michalos assembled an editorial board, called for papers, and ventured forth.

Sometime in 1981, Michalos invited Deborah C. Poff, to join him as managing editor of the journal. She later assumed the role of editor of

the new journal, while Michalos retained the role of editor in chief.

The rough model for jobe was *Science*, the official journal of the American Association for the Advancement of Science, i.e., a scholarly magazine with articles, book reviews, photographs, letters to the editor, and general news about research in the field. In more ways than one, jobe is very different from *Science*. We never managed to include photographs, stopped publishing book reviews after several years of struggling to find reviewers, occasionally publish letters, often publish announcements of conferences, and other events related to business ethics and mainly publish articles. Discussion notes on published articles were always welcome but seldom appeared. The lively exchanges of views we hoped to see just never happened.

Although the journal began as a quarterly, its growth was phenomenal. In 1985, it rose to 6 issues, then 8 in 1987, 11 in 1988, 12 in 1989, 16 in 1997, and then jumped to 5 volumes per year (4 issues per volume) in 1999, 6 volumes in 2000, and 7 volumes in 2003, which it has continued to publish to the present, 2017. As we write this article, jobe has published 142 volumes, 687 issues, and 7773 articles.

Celebrating the first 30 years of publication of jobe, Michalos and Poff (2013) published *Citation Classics from the Journal of Business Ethics*. In the 1982–2011 period, jobe produced 4747 articles. The mean number of citations per published article was 7.1, and we defined "citation classics" as any article with a citation rate at least four standard deviations above the mean. Fifty-five articles were in this set, 33 reprinted in the volume.

Over 100 fairly well-known scholars in the field wrote short notes in the volume answering the question "What, if any, has been the impact of the *Journal of Business Ethics* on the field of business ethics?" Sirgy (2013) specializes in marketing ethics, and he assessed the impact of the journal on the basis of citations to it in eight "major books" published on marketing ethics over the past three decades. He concluded that "in its 30-years history *JBE* has made a significant impact on the dissemination of knowledge in marketing ethics through pedagogical books used in the classroom to teach marketing students."

Comparing average citation rates for articles in *Jobe* and the *Business Ethics Quarterly* (beq) in the 2001–2011 period, we found that the mean for *Jobe* articles was 4.6 and for beq 4.4. “The maximum number of citations for a *Jobe* article was 124, compared to 90 for BEQ” (Michalos and Poff 2013). The total number of articles published in the period for *Jobe* was 2753 and for beq 430.

Michalos and Poff retired from editing the journal in 2015, 33 years after initiating it. The new editors are Ed Freeman and Michelle Greenwood.

## Introduction

In this era of a 24/7 news cycle, journalists are caught in a tug-of-war between their ethical and professional responsibilities and the realities and pressures of the media world. Journalists, at least those affiliated with traditional US mainstream news outlets, are expected to be fair, balanced, ethical, and accurate. However, they also face growing pressure – with ethical implications – to produce more and more stories, photos, blog posts, podcasts, and videos for a combination of print, online, and broadcast media platforms. At the same time, many are expected to build a following on Twitter or Instagram – essentially to make themselves a brand – that drives traffic to their news outlets’ websites and generates clicks.

One *New York Times* columnist observed, “Twitter has occupied an uncomfortable place between journalists and their bosses for more than a decade. It offers journalists both a newswire and a direct line back into the news cycle. But it has also set off a tug of war between the voice of the brand and of the individual” (Smith 2021). At stake: public trust in the fairness and integrity of news outlets, including the potential of getting rapid positive feedback and, unfortunately, negative personal attacks from the audience. The Tow Center for Digital Journalism at Columbia University describes the tension this way:

Journalists increasingly rely on social media platforms such as Facebook and Twitter to pursue audience engagement, which many believe necessary for improving journalism’s popularity and credibility among the public. However, journalists have learned that engaging with their audiences via social media platforms carries personal and professional risks—namely accusations of political bias that can lead to termination from their jobs, trolling, doxing, and threats of physical violence. This is especially true for women journalists and journalists of color (Nelson 2021).

## Ethics Codes for Professional Journalists

News organizations, professional associations, and media-related labor unions around the world have ethics codes for their journalists, a

movement that began in the 1920s as an effort to avert possible government legislation and regulation. “When ethics codes are completely developed by journalists, they are considered as self-regulatory instruments . . . that provide an opportunity for journalists to negotiate through the particular media system/regime within which they operate to stay effective” (Serwornoo 2019). Other codes are developed and imposed by government agencies or by professional associations and unions that are proxies of the state. What is deemed “ethical” or “unethical” varies among countries because ethics codes reflect differences in cultures, histories, media economics, political environments, moral and religious values, the organization or entity that wrote the code, advertiser or funder expectations, and the degree of journalistic independence. In other words, there are no universally accepted moral norms in the profession. Were there such unanimity, as Jones (2021) observes, “The difficult work of journalism could be reduced to a formula: identify one’s duties and carry them out.” He continues, “When professional organizations and media outlets have drawn up ethical codes, however, the vagaries of lived experience prove more complicated. . . . No magic formula can guarantee morally correct choices are made.”

Most codes are voluntary to some degree, although violators may face sanctions such as firing or discipline by their employers or canceled membership in a professional association. That has happened over the years to journalists at such prominent US media outlets as National Public Radio, CBS, CNN, NBC, the *San Francisco Chronicle*, Fox News, and the *New York Times*. Some “lost their jobs following an expression of their opinion, some whose opinion politically charged, some whose opinion was considered politically incorrect or insensitive, and some whose opinion was considered harmful to the prosperity of the organization” (Pewitt-Jones 2012). Many of the punished journalists “showed a lack of self-censorship” and, not surprisingly, social media use figured in one of the examples Pewitt-Jones gave: the CNN senior editor of Middle Eastern affairs fired for a Twitter message expressing respect for a Shiite cleric who had spoken in favor of suicide bombings against Israel.

Some traditional ethics codes, such as that of the Society of Professional Journalists, focus on general principles such as seeking and reporting the truth, minimizing harm, acting independently, and being transparent and accountable. Others, like that of the *New York Times*, include specific social media guidelines, saying that “social media presents potential risks for *The Times*. If our journalists are perceived as biased or if they engage in editorializing on social media, that can undercut the credibility of the entire newsroom.” An example of a detailed social media code comes from a major publisher of business magazines. It emphasizes how the proliferation and dominance of social media platforms could threaten whether the public sees a news organization as credible. Its Editorial Employee Social Media Policy says:

Social media plays a significant role in journalism and how we connect with our audiences. Social platforms give journalists the opportunity to promote our stories, connect with sources and audience members, and engage with readers in real time. There are also risks associated with social media. If our journalists are perceived as biased because of opinions expressed on social media, that can undermine our credibility and integrity. . . .

That publisher’s code calls for “unbiased journalism” and “balance in sources and views presented” and cautions that the policy covers all of an employee’s social media activity, including posts and likes from their private accounts. It urges employees not to join partisan social media groups, to respect the audience when responding on social media to reader criticisms or questions, and to consult with their editors on “an appropriate course of action” before replying to “offensive or aggressive” comments. And it emphasizes “our fundamental value that employees should not express personal opinions on controversial issues of the day or do anything that could harm any of [the company’s] family of brands.”

## Defining Self-Censorship

Self-censorship, such as not deliberately reporting on corruption is a serious threat to independent or autonomous journalism. Journalists or their

superiors at their news organizations choose not to say something – perhaps not to report a story on the government, not to opine on a new law, or not to cover suspected wrongdoing by a major advertiser or sponsor. The omitted information, analysis, or opinion could be important for the public because of its factual nature or because it would contribute to a robust public debate on an issue. On one hand, the word “self” stresses individual agency and decision-making; on the other hand, the word “censorship” signifies an external force imposing itself on individuals or collectives. A survey of Russian journalists explained that the term “self-censorship” encompasses both “self-limiting under pressures and personal-level ethical decisions that substitute professional codes on conduct.” The authors found that “political threats” – including political restrictions imposed by the government and the political and commercial interests of media owners – “remain the most significant of all external pressures both online and offline, but personal motives lead the decision-making in posting on social networks.” When it comes to such networks, journalists are themselves responsible for the final result; they are the ultimate decision-makers in terms of content” (Bodrunova et al. 2021).

However, it is also important to recognize that some journalists would not consider self-censorship to be a negative in light of their belief in a greater good that may outweigh independent reporting without fear or favor. Such beliefs may be rooted in and motivated by nationalism and patriotism, policy preferences, or concern over major social and economic issues. For example, Soviet professional journalists generally accepted the role of being government agents for planned social change – propagandists – despite a conflict with the ethical model of journalists as mere recorders and observers who cast aside their political biases and ideologies and strive for accurate, fair, and balanced coverage. That interventionist model was rooted in Marxism-Leninism, and adherence to it was a pathway to becoming part of the privileged elite. A second interventionist model is development journalism, pioneered in Asia in the 1960s and advocating that the press be an agent of national economic development

and social change. Unlike the Soviet model, it is not fully integrated with the government or a political party (Shafer and Freedman 2007).

## Self-Censorship in Practice

There is abundant evidence that journalists around the world engage in self-censorship to protect their safety, liberty, family, and jobs. In most instances, their decisions about what not to report receive little or no attention from audiences and even from fellow journalists. There are exceptions, though, as reflected in the high-profile international controversy among newspapers in Europe, the USA, and elsewhere in 2005 over whether to republish editorial cartoons depicting the prophet Muhammad after violent reactions to their appearance in the Danish newspaper *Jyllands*. For journalists and their news organizations in such situations, one perspective is whether to disseminate offensive or “extreme speech out of a desire to trumpet the value of freedom of the press, despite the possible harms that could come from publication.” Or, to refrain from publishing could “be seen as self-censorship committed out of fear of similar reprisals, which would be considered harmful to the democratic duty to promoting freedom of expression” (Johnson et al. 2021).

The Committee to Protect Journalists (CPJ), an international press rights defender organization, reports on such situations. Among them: Armenian journalists fearful that a 2021 law tripling fines for insult and defamation “will be used as a tool to clamp down on critical outlets and will lead to self-censorship, especially as lawsuits against the press have sharply increased in number in recent years.” In Malaysia, CPJ called the fining of an online news outlet for contempt of court in 2021 a “wrongheaded verdict (that) will inevitably lead to more self-censorship and less press freedom” in the country. Malaysia the same year enacted an emergency powers ordinance that criminalizes criticism of the government’s response to the COVID-19 pandemic as “fake news.” Article 19, another international human rights organization, warned that the ordinance

would have a chilling effect on free expression and would put pressure on journalists and news organizations to choose self-censorship as a way to avoid criminal penalties.

The self-censorship environment is dire in many other places as well. Self-censorship is now the norm in many parts of Mexico, a country beset by drug cartel-related crimes, violence, and corruption that the press does not cover (Chavez 2020). In Sri Lanka, CPJ highlighted how attacks on journalists, including murder and “an environment of fear and self-censorship” result from impunity for attackers who are not investigated, prosecuted, and punished. Speaking about Nicaragua, PEN International, a free expression advocacy NGO for writers and journalists, observed, “Threats of criminalization have affected the journalistic sources that media outlets and journalists rely upon for analysis and opinions. In addition, several lawyers who have defended journalists have also been forced into exile. This has led to a growing climate of self-censorship in the country.” A study of Eastern and Central European journalists in three post-Soviet countries found self-censorship, autonomy, and journalistic freedom “are just as severely affected by economic constraints, oligarchic influences, and new authoritarianism as they are by their Communist pasts. Either way, journalists know exactly what to report, what to omit, and how to advance their careers” (Schimpfössl and Yablokov 2020).

Repercussions for journalists and their organizations that do not exercise self-censorship can take the form of assassination, physical assault, threats and harassment, imprisonment, civil and criminal libel and “honor-and-decency” lawsuits, forced exile, confiscation of equipment, loss of government licenses, tax audits, firing, shutdowns of newsrooms, cancellation of advertising – and more self-censorship. Journalists targeted in these ways sometimes develop drug and alcohol abuse problems, depression, and post-traumatic stress disorder, go into self-exile, or leave the profession. For some others, however, such adverse experiences reinforce their sense of mission (Freedman 2019).

## Bloggers and Self-Censorship

At the same time, bloggers and other communicators, many without formal training in journalism or professional ethics, have become increasingly visible sources of news and information, as well as of disinformation and misinformation. That is particularly true in countries with few or no independent news agencies, where people fear being seen talking to journalists, or where traditional journalists cannot gain access to a location. These bloggers, sometimes considered “citizen journalists,” often blur traditional Western journalistic borders between objective reporting and opinion, and between advocacy and objective information dissemination. That blurring of lines, in turn, makes it increasingly difficult for their readers, viewers, and listeners to assess the credibility and objectivity of a story and its source.

The blogger-as-quasi-journalist model is not a new phenomenon, although the technologies have changed. During Soviet days, anti-communist activists and democracy advocates published and distributed underground newspapers called *samizdat*, often at risk of jail or exile to a gulag, in the USSR and its satellite nations. One famous Russian dissident of that era, Vladimir Bukovsky, acknowledged that self-censorship existed in this poem about *samizdat*:

I myself create it,  
edit it,  
censor it,  
publish it,  
distribute it, and ...  
get imprisoned for it.

Bloggers who don't self-censor are especially vulnerable to retaliation or punishment from government, organized crime, industries, politicians, and other powerful official and unofficial institutions. These incidents illustrate their vulnerability: a knife attack in France on an exiled Azerbaijani video blogger who reports on corruption and political persecution; the beating of an Uzbek blogger by an official at a state-owned electricity company that she was investigating; and the jailing of Russian blogger accused of participating

in a rally supporting an opposition leader. Since most blogger-journalists don't work for news organizations, they usually lack access to support from influential institutions with clout to defend their employees.

## Averting Problems from the Practice of Self-Censorship

Ways to minimize or avert problems related to self-censorship and social media use can go in several directions. One is for journalists to eschew Twitter, Instagram, and similar platforms. Admittedly, that in itself can be interpreted as a form of self-censorship – or as a reflection of the biblical plea to “*do not lead us into temptation*” – in this case, the temptation to comment, often in real-time like a play-by-play sportscaster at a basketball game and without careful consideration of what is tweeted or posted. For example, *New York Times* columnist Thomas Friedman, a three-time winner of the Pulitzer Prize in Journalism, says, “Reporters tweeting is just wrong,” although he engages in it. In a public radio interview, *New York Times* opinion columnist Farhad Manjoo opines that Twitter is damaging American journalism, adding “If something is big on Twitter, we put it on cable news, we put it in the paper, we put it everywhere else. I don't think Twitter is sort of a reflection of the real world” (Hobson 2019). The Poynter Institute, a nonprofit US journalism school and press research organization, has reported how “a growing group of journalists has cut back on Twitter, or abandoned it entirely” (Lieberman 2021). Twitter and other social media platforms can impair journalists' efforts to separate fact from fiction, the article said, noting that during the COVID-19 pandemic, some well-known journalists retweeted a fake account's erroneous claim that a major movie star had gotten the virus. However, eschewing the use of social media as an immediate avenue to the dissemination of news may be unrealistic in the real competitive reality of the media world where a tweet or blog post is often the fastest way to scoop one's rivals, rather than waiting for the 6 o'clock news show, the newspaper to come off the printing

press, or the posting of the daily e-newsletter. Being first matters, sometimes even more than being right, regardless of the ethical pitfalls of failing to adequately investigate, inquire, and fact-check.

## Justice

John Douglas Bishop  
Trent University, Peterborough, ON, Canada

### Synonyms

Synonyms for injustice and unjust: oppression, discrimination, rights violations, illegitimate power, theft; Synonyms for justice and just: fairness, equity, equality, human rights, civil rights, liberty, democracy

### Definition

Justice and injustice are evaluative concepts, as are the related concepts of just and unjust. That is, the meaning of a phrase that uses any of these words contains a positive (justice and just) or negative (injustice and unjust) evaluation of some referred to entity. This raises several very difficult questions. Key among these are: (1) What sorts of entities do these concepts evaluate? (2) What is the criteria by which the evaluation is applied? (3) What are the grounds for criteria of justice? (4) In what sense do such evaluations exist?

For example, can I say a social practice is unjust? Under what conditions would my claim be true or false? How can I know if I was right or not, and what arguments or evidence could I present to others to convince them I was right? Finally, in using justice related words, is a person identifying an objectively existing fact, or merely expressing a subjective opinion of some sort?

It is not the purpose of this entry to propose definitive answers to any of these questions. Rather the purpose is to examine the nature of justice, to identify facets of justice, and to provide guidance to debates about justice by identifying the most common possible answers to these sorts of questions.

## Justice and Related Concepts Can Be Categorized in the First Instance by the Sort of Entity Evaluated

1. Theories of **distributive justice** evaluate economies and the distribution of wealth and income that results from an economic system. They evaluate the outcomes of economic transactions or the nature of those transactions.
2. Theories of **procedural justice** concern the fairness of laws and legal procedures; indeed, the legal system is often referred to as society's justice system.
3. **Global justice** evaluates relations among individuals on a global basis, and/or relations between sovereign states. Development economics compares states by considering the extent of wealth and poverty of individuals within those states. International justice considers conflict between states, discussing, for example, under what conditions war might be a just war.
4. Concepts of **political justice** are used to evaluate governments, constitutions, and other political institutions. This often includes discussion of forms of government such as democracy, oligarchy, dictatorship, and so on.
5. **Civic justice**, often discussed in the form of civil rights, evaluates not only governments but also other organizations and institutions of civil society. Under this heading, one can ask such questions as: Is the education system just? Is scientific and medical research done justly? Is the welfare system just? Are taxes just? And so on.
6. The concept of justice is also used to evaluate **individual persons**. Thus, we might ask: what is the nature of a just individual? Sometimes the notion of a just person is extended to

corporations; corporations are, after all, persons in the eyes of the law. However, the notion of a just corporation has not yet been extensively developed.

7. **Social justice** is most often used as a collective concept that judges a society overall including its economic, political, social, educational, and other aspects.

### Theories of Justice Vary by the Criteria by Which the Evaluation Is Applied

1. **Distributive justice:** Theories of distributive justice evaluate economies and the distribution of wealth and income within societies. Some theories of distributive justice evaluate the outcomes of economic transactions, usually considering the equality or inequality of wealth and income. Egalitarian theories advocate equal distribution of wealth and income, completely equal in the case of strict egalitarianism. But many egalitarians suggest a more limited equality, such as Rawls who argued that unequal distributions are justified if inequality promotes the interest of the least well-off. Resource-based theories of distributive justice maintain that equal opportunity is more relevant than economic outcomes. Some such theories emphasize the need for equality of education and childcare; others argue that opportunities must extend far beyond education. Desert based theories consider the labor, risk-taking, ingenuity, and other contributions people make to socially produced wealth and income; the income and wealth a person deserves depends on how much they contribute to the economy, how much effort they make, and/or their needs. Free markets are sometimes thought to distribute wealth according to desert, but market failures make this questionable in practice. Process based theories of distributive justice argue that if every economic transaction is just, then the resulting distribution is just regardless of any characteristic, such as (in)equality, that that distribution has. Libertarians such as Robert Nozick (1974) often take this view. Safety net theories

maintain that distribution is irrelevant to economic justice provided no one is destitute; such theories can be used to justify the welfare state or a Universal Basic Income (UBI). Some feminist theorists have pointed out that discussions of justice ought to consider issues of the distribution of wealth, income, power, and contributions within families, not just the wealth and incomes of households. There are numerous gender and intergenerational issues of justice within families. Some North American aboriginal peoples maintain that if wealth means the ownership of land and other means of production, then wealth should not be distributed to individuals; such wealth should be owned by society as a whole or by a community or clan. Marxist and other communists argue that the means of production should be owned by a class such as the proletariat; in practice, this often amounts to ownership of the means of production by the government (which many people now think is not a good idea). Utilitarian theories argue that justice should be based on the total sum of human welfare (or utility) in a society. Definitions of human welfare (or well-being) are much discussed. Finally, some people such as Buddhists argue that the distribution of wealth is irrelevant to justice as long as no one is destitute; they think we should be paying attention to more important things than income and wealth.

2. **Procedural justice:** Procedural justice concerns the justice of legal systems. Most importantly, legal systems are considered just if they are fair, unprejudiced, and free of bias of every kind (Gilbert 1875). To this needs to be added fair and unbiased access to the legal system. Some legal systems use an adversarial process in which the prosecutor and the accused, or the plaintiff and defendant, each present their side of the case with a judge or jury to decide between them. Other judicial systems use an investigative process. Each of these can be considered just if applied fairly.

The origins of laws are also a matter of justice. Just laws can be the result of statutes passed by a democratic legislature, by common law precedents established by previous court

decisions, or by civil codes created by legitimate governments. In all cases, just laws should be consistent with the country's constitution.

Besides the fair application of laws, the justice of the legal system itself can be evaluated using various criteria. Legal positivists think that any unbiased outcome of the legal system is just if legal procedures are followed correctly, and that there are no criteria outside of the legal system for establishing the justice of the legal system. Those who think that laws and legal systems themselves can be evaluated by standards of justice external to the legal system seldom agree on the appropriate criteria. The law and economics movement, for example, argues that law should be framed so as to maximize incentives for people to produce wealth. Others use human rights or abstract notions of fairness to evaluate legal systems. Hobbes (1651) used security of person and John Locke (1690) the protection of private property as criteria.

3. **Global justice:** The issue of global justice is fairly new to humankind, and neither theory nor practice is highly developed. One of the key theoretical issues concerns whether justice should consider all human beings as individuals (called ethical cosmopolitanism), or whether it should give basic nonderivative ethical priority to some collective of humans such as states, nations, sects, or classes. Discussions of individual justice center mostly on human rights and/or economic development. An ethical principle of the equality of all people is often proposed, but defining equality (or even human rights) across radically different cultures and religions is difficult and may be impossible. There is also the practical problem that no one currently knows how to generate sufficient economic development to achieve global equality. Justice between states or nations considers sovereignty rights, self-determination, humanitarian interference, the justice of wars, and the justice of trade agreements. Global procedural justice and international law are fast developing areas which include treaties (bilateral, multilateral,

universal); international courts for trade, criminal and war crimes issues; and international organizations such as the WTO, UN, and EU. Global environmental justice is a major issue on which there is little consensus.

4. **Political justice:** In the first instance, political justice is often thought to depend on the form of government, that is, whether government is a democracy, an oligarchy, a dictatorship, and so on. Many people, perhaps most, think that democracy is the only legitimate and just form of government, but some people think that just governments should cater most to the needs of businesses, entrepreneurs, and investors as a means of promoting maximum economic growth. Such governments tend towards oligarchy, that is, the rule of the rich elites. Some authoritarians argue that certain individuals, "the proper authorities," deserve to govern because of their inherent superiority by race, religion, gender, cast, virtue, intelligence, or education. Such views may be hard to defend as just, but some people accept them.

Regardless of form, any government can also be assessed on whether it treats its citizens and foreigners with justice. Often such discussions are conducted in terms of respect for human rights, or the lack of such respect. Human rights (sometimes called civil rights) can also be used to evaluate civil society, that is, nongovernment institutions and organizations.

5. **Civil justice:** Civil justice considers whether a society is just. This generally includes economic, procedural, and political justice (see above), but extends beyond these, often to include judgments on human or civil rights, the extent of social mobility and opportunity for individuals, issues of class or caste injustice, and access to healthcare, education, water, food, housing, security, and so on. Social justice is often discussed using such concepts as freedom, social equality, rights, human welfare or well-being, and equal respect for all individuals. Campaigns against discrimination, poverty, exclusion, underperforming schools, slums, inaccessible services, and so on usually appeal to concepts of civil justice or civil rights. Some people base such claims to civil

rights on nondiscrimination and equality; others, such as Burkean conservatives, argue from principles of justice that emerge from tradition and cultural heritage (Burke 1790).

6. **The just person and just corporation:** The concepts of justice and injustice usually evaluate social institutions, not a specific individual. Yet historically, people have often spoken of a just or unjust man or woman. Sometimes, the (in)justice of the individual is derivative of larger social evaluations; the just individual is one who acts consistently with or promotes justice within his or her society. In some cases, the individual may be a social institution in themselves because of the social role they play such as a lawgiver, a king, or a judge. Again, the concept is derivative; a just king, for example, rules consistently with social and political justice.

This approach creates an interesting dilemma; how can individuals be just if they live in an unjust society? Underlying this is the question: are there criteria for judging the justice of an individual not derivative from criteria for social justice? Of course, we have many criteria for judging individuals as ethical or not; perhaps these are sufficient except when the individual is performing a social role.

An interesting question in the context of modern corporate capitalism is this: what criteria of justice applies to corporations or businesses? The derivative concept of a just corporation is (at least theoretically) easy to define: a just corporation is one that conducts all its business actions consistently with just institutions in a just society. If, for example, corporate tax evasion undermines a government's pursuit of social, economic, and political justice, then that corporation is behaving unjustly. It would also be behaving unjustly if it used its money and lobbying power to corrupt the just political system.

The requirements of social justice place many obligations on the just corporation. For example, a corporation's hiring, training, and promotion practices ought to be consistent with just principles of equal opportunity, equality of respect, procedural justice, and so

on. A just corporation will cooperate with government efforts to promote a just society, and conduct all business transactions consistent with social, economic, and political justice.

This approach to defining how concepts of justice apply to corporations creates a problem: how does a just corporation conduct just business in an unjust society? For example, in a society in which most government officials are corrupt, should a corporation pay bribes? On the one hand, it may be the only way to get business done; on the other, it exposes the corporation to accusations of supporting a corrupt elite, hindering economic development, preventing the government from creating just health and education systems, and so on for all the other unjust outcomes of significant government corruption.

The evaluative concept of justice can be applied derivatively to corporations, but that leaves unanswered many questions of how a just corporation should conduct its business. However, some issues are clear; for instance, a just corporation does not discriminate based on gender, race, caste, etc.

## What Are the Grounds for Criteria of Justice?

There are many criteria on which people base evaluations of justice and injustice. As a result, people have been forced to think about the grounds for using one criterion and not others. For more than 2000 years, European philosophers have considered this question.

One possibility, discussed since Plato (2012), is that anything powerful people do and get away with should be considered just. In short, might is right. This may say something about power, but it does not ground the evaluations we often make that the powerful sometimes behave unjustly. A related possibility is that the powerful determine our society's criteria for evaluating justice, though they themselves sometimes behave unjustly according to their own criteria. The problem with this view is that it may tell us the origin of the criteria of justice, but it does not ground any

concept of justice in the sense of giving a reason for accepting that concept. Further, the truth of the claim has been questioned. Nietzsche (1887), for example, thought the opposite; he suggested that concepts of justice (and morality) were created by weak people as a means of using guilt to protect themselves from the unjust predations of the powerful. Nietzsche was clear that this might account for the origins of our concepts of justice, or, as he says, give us a “genealogy of morals,” but it is not a good reason for accepting any specific criteria.

Other philosophers have argued that humans have an innate sense of fairness, and that our concepts of justice are based on that – a view enhanced by recent discoveries that very young children and some nonhuman primates get upset by blatant unfairness. This view, unfortunately, does not help us decide which of the many proposed views of justice we should adopt. Most criteria of justice are much more sophisticated than angry gorillas.

A more serious effort to derive justice from human nature was made by defenders of the “natural law” approach, especially St. Thomas Aquinas. Thomas of Aquinas (1265–1274) thought what was just was that which was in accord with the purpose of human beings, namely, rational thought. In particular, he thought that all human-made laws could be judged just or unjust depending on their consistency with natural law. This view would seem to depend on knowing the purpose of human beings, but later writers often thought that knowing human nature was sufficient. Indeed, they often maintained that natural law was self-evident. This is especially true for writers who thought natural law did not primarily guide human obligations, but rather defined natural or human rights. Today, most people think that human rights are more fundamental than government made laws and can be used to judge the justice or injustice of those laws.

Social contract theorists have argued that the criteria of justice can be derived from imagining a hypothetical contracting process. Generally, the contract was made by all people in the society *about* government and laws; it was not a contract between the people and their government. Hobbes used this approach to argue that personal security

was the aim of any system of government and justice. John Locke thought that security of private property as well as security of person was paramount. In *A Theory of Justice* (1971) Rawls imagined the negotiators of the social contract as rational agents behind a “veil of ignorance,” that is, they would not know particulars about their social and economic position. From this, and from his assumption that rational people would not gamble, he concluded that justice involved, firstly, maximizing everyone’s freedom (providing they did not infringe on the freedom of others), and secondly, ensuring that economic and social inequalities should benefit the least well-off and that everyone should have an equal opportunity at gaining social and economic goods. His principle of benefiting the least well-off is known as either the “difference principle” or the “maximin principle.”

For some theorists, justice is a matter of social convention or tradition. This implies an acceptance of the variations in criteria of justice in various societies and the rejection of the possibility of any universal laws of justice. In sophisticated defenders of this theory, such as Edmund Burke (1790), the fundamental principles of justice emerge slowly out of long traditions of accepted legal, economic, and social practices. Some modern philosophers, especially in France, view justice as a social construction and are keenly interested in how it is constructed and how it reflects social, economic, and cultural privilege and power.

The utilitarian approach recommends the acceptance of any principle of justice if that principle promotes the “greatest happiness of the greatest number” (a phrase that Jeremy Bentham derived from Francis Hutcheson). Thus, for example, laws protecting private property are just because security of property is essential to a well-functioning economy from which everyone benefits. The law and economics movement asserts that laws ought to recognize incentives for entrepreneurial hard work and the development of new ideas beneficial to society.

Isaiah Berlin (1958) argued for pluralism; that is, that there are many social values that can be used to evaluate justice and injustice, some of

which conflict with each other. This creates trade-offs. Pluralism implies that there is no way for any society to exhibit all just values at once. Amartya Sen (2009) has also argued that conceptualizing and pursuing a perfectly just society is counter-productive; instead we should mitigate specific forms of injustice as best we can.

Finally, some people think that the rules of justice can be viewed as the solution to social and economic coordination problems. Mostly, this is a development of game theory, but to date there is no well-developed consensus for game theory based principles of justice at the social level. However, some specific results have been claimed, such as *Arrow's impossibility theorem*, or the *tragedy of the commons*.

### In What Sense Do Justice and Injustice Exist?

Is justice entirely a human creation, or do the principles of justice exist in some way independent of human views? Those who think justice is established by god, scripture, or natural laws think that the principles of justice exist independently of all human thoughts and actions and that the true principles of justice can be established objectively. Utilitarians think that justice requires empirical content since for utilitarians we need to establish what in fact will make people happy. On the other hand, those who think justice is a social construction or a matter of convention and tradition think that justice is a human creation; however, this does not mean that justice is a matter of the individual's subjective opinion but rather that it is a creation of society as a whole. This implies that to discover the principles of justice in any given society one would have to do empirical research to determine how justice is viewed in that society. There are a few or no theorists of justice who seriously maintain that justice is a matter of individual subjective opinion or taste.

### Summary

The words “justice,” “injustice,” “just,” and “unjust” are all evaluative terms; that is, they

express the speaker's positive or negative views about the society, economy, legal system, government, institution, practice, or other entity to which the terms are replied. However, this does not mean that they express only a person's subjective opinion. Some people think that the principles of justice are objective facts and others think they are the creation of human societies. Claims about (in) justice must be based on general principles and grounded in rational discussion. For example, the justice or injustice of the distribution of wealth and income in a society can be based on the principles of egalitarianism, equal opportunity, safety net theory, just processes, or other principles. Which principle a person uses needs to be grounded in rational argument based on natural law, social contract theory, utilitarianism, convention, tradition, or coordination issues. There are, and no doubt always will be, differing views about justice, but that makes it even more important that one's views are guided by clear principles and grounded in rational argument.

## Synonyms

Categorical imperative; Freedom; Goodwill;  
Moral realism; Practical reason; Universal law

## Introduction

Immanuel Kant, with his “brilliantly dry style” (Schopenhauer), expounds the notable theory that “objects are approaching to the mind” via the spectacle metaphor by addressing transcendental idealism in support of the mind as an active knower (mind-making nature), not passive in a realistic sense, while objects of knowledge conform to the mind begotten in categories of understanding. On Kant’s view, James Conant writes, “Kant’s term for this unity, considered at this level of abstraction, is the original synthetic unity of the understanding. This admits of forms of further determination, one sensible and one intellectual. This form of unity – categorical

unity – characterizes both the manner in which objects are given to us in intuition and the manner in which concepts are combined in judgments” (Conant 2016: 114).

Insofar the same pioneering stance is reflected in the *Groundwork of Metaphysics of Morals* (Kant 1972) and the *Critique of Practical Reason* (Kant 1996), where Kant underscores the accessible account of reason and freedom as the content of fundamental moral principle toward a kind of universalizable moral duty attuned with the formulation of categorical imperative. The justification and groundwork of these moral laws cannot be liaison in sensory experience but on pure reason, which Kant calls “a priori,” a conviction stems from the understanding of rational necessitation of moral obligation and free autonomous agency. This interpretation absorbs the practical principle that underlies the subjective maxim to justify the necessary and sufficient conditions for a universal moral law. Kant starts out saying that an act is morally right if it is performed for the sake of broadening the vista of maxim infused by goodwill consisting of the categorical imperative that sounds an exceptionless command, abstract law, and universally applicable normative principle as well. For Kant, the categorical imperative has many-sided structures:

- a. Ethical requirements are rational requirements of the moral agent.
- b. The rational requirement goes toward universal laws.

- c. These moral requirements must be followed by equality, freedom, and goodwill.

## Human Dignity and Objectivity

In Kantian ethics, human dignity and value are cluster approaches as having non-natural and intrinsic properties, thus they look for the property of autonomy. Humanity itself stands for dignity where all human beings obligatorily have the duty to acknowledge and respect other human beings equally, since “respect is recognition of dignity” without any condition or preference. Kant emphatically stresses that morality has a rational foundation. The reverence for moral laws enables self-esteem and guides us in all the imperatives that ought and ought not to be to contravene the ethical depravity in the society. Kant never abstains from extrasocial moral duties to expand duty to oneself (Potter 1998: 34–35).

An act dictated by the faculty of pure reason is objectively normative and also subjectively necessary as a moral motivation. It is subjectively necessary because an act will govern through reason and motivation, which are practically necessary, i.e., good and quite apart from any utilitarian craving. Had it been the case that reason subjectively chooses the instincts of impulses (instead of reason), then the act would not have coincided as being objectively necessary. Jan Narveson considers, “Universality does suggest that there are aspects of human nature and of culture which, taken together, make a strong case for us all to adhere to them. To show that morality is universal or at least has a universal basis, one must appeal to *practical reason* and all that it is based on. This is certainly subjective in that it is about people and their actions, therefore their interests and such - which are by definition ‘subjective’ but not in a way that would show morals to be subjective” (Personal correspondence February 2022).

Thus, the conception of an objective condition is the command of will (reason) and is understood as an imperative produced by practical reason, and the sensible world consists in the object of pure reason aimed at its application. Moral laws are

necessary in every respect since they are rooted in reason and not contingent on human experience. Sanjit Chakraborty writes, “In modern philosophy, Immanuel Kant fairly introduces the idea of objectivity in his epistemology by bringing the conception of the universal as a necessary condition, which constitutes all the objects in relation to its syntactic power. One alternative that Putnam focuses on his writing talks about a pragmatic alternative to the objective judgment, a stance of ‘intersubjective’ point of view that derives from a historical background by considering the ethical ideals of rightness and wrongness in terms of the speakers and the hearers’ communications” (Chakraborty 2019: 374).

## Goodwill and Categorical Imperative

Kant, in his book *Anthropology from a Pragmatic Point of View* (Kant 1974), claims that in the case of good fortune (wealth, power, and aristocracy), people have an innate propensity to think that they have the merit to deserve all these fortunes, and this egotistical delusion provokes them to act certain moral evils to others in society. Goodwill would produce good spontaneously and naturally without being stimulated by any conditions. According to Kant, a person’s happiness promoted by badwill as a condition seems bad in itself. Of course, the qualified good likes to encompass “good within itself” that will be the agent’s inner worth. Kant writes, “It is impossible to conceive anything at all in the world, or even out of it, which can be taken as good without qualification, except a *good will*” (Kant 1972: 59).

Actions may be maintained (a) *out of duty* and (b) *in accordance with duty*. The former, that is, actions done *out of duty* (duty for duty’s sake) implies actions from pure reason, i.e., knowing what we ought to do relying on moral laws, whereas the second one (*transgression*) is a matter of acting in accordance with what they require, but not consistent with duty. This “ought” is categorical (moral), and hence it is therefore intuitive, immediate, absolute, unconditioned, and reliant on rationality. Contrary to this kind, there is another kind of “ought,” which is hypothetical

(non-moral), entailed by instrumental reason, and those done *under a transgression/reatus*, out of empathy and with the purpose of ulterior gains. Hence, as conditioned by free will, morality is reflected through right conduct as and when the element of pure reason successfully combats the enticement of passion and pleasure. This opinion differs from Darwinian metaethics that denies moral or religious myths about morality, as Ruse argues, “The Darwinian says that we humans have evolved naturally with our moral code” (Ruse 2021, 182).

An act, for being moral, obliges to the three maxims of morality: *the principle of universality*, to be able to apply everywhere without any contradiction occurring; *the formula of humanity*, i.e., a shift from means-centric approach to end-centric approach; and *kingdom of ends*, make decisions autonomously which would be acceptable to a community of rational agents. Unlike the hypothetical ones, categorical imperatives are elements of moral obligation, and hence its commands are also of necessity, an a priori command. Its necessity (like hypothetical imperatives) is not of mere practical consistency, instead these are non-analytic, and hence synthetic. Thus, the categorical imperative stands as a *synthetic* a priori judgment of practical reason. The categorical imperative is a rational moral requirement, having a universalistic stance and based on the ideals of equality and reverence.

Different contemporary interpretations of Kant’s formula (*universal law*) decipher diversified directions as Thomas Nagel embarks on placing the Kantian moral agent in the position of billions of other people, while Rawls interprets Kant’s formula by emphasizing rational will instead of knowing ourselves and the circumstances. Even an unprejudiced bystander’s stance could be placed in the case of Kant’s formula as suggested once by T. C. Williams. In contrast to the mentioned opinions, Parfit interestingly argues, “Kant may assume that what any one person could rationally will must be the same as what everyone else could rationally will. . . This assumption, I have claimed, is false. What could be rationally willed by many of those who are

men, rich, or powerful could *not* be rationally willed by many of those who are women, poor, or weak” (Parfit 2011: 340).

## Reason, Freedom, and the Highest Good

In this classic work *I and Thou*, Martin Buber vindicates Kant’s philosophical predicament between the notions of necessity and freedom in a relative way. Kant assigns the necessity in retrospect of the world of appearance, while for freedom to invite epiphanic entanglement, he brings up the world of human beings so that freedom could blend in the necessity, and these two settings have much to offer in the world of thought (Buber 2004, 74). In reflections about conscience or moral values, Freud apparently outlines conscience as an infantile opening out that should not occlude because of impoverished paternal values. Nevertheless, for Kant, the staking idea of conscience (significantly goodwill) is innate, which Freud begs off. In Kantian treatment, morality is nothing but the passage on the awareness of the inner court, and it may be more than moral feeling since here the proclivity has been subservient by the concept of duty for duty’s sake. Richard Sorabji clarifies, “How can different faculties play the same role? The solution may be that conscience is not the name of any one faculty, but of the whole quasi-judicial process in the court” (Sorabji 2014: 180–181).

Accepting the notion of conscience that plays many facet roles exacerbates the intricacy of an erroneous conscience about moral laws, which might not be blameworthy in many cases. As Kant depicts, moral rules are categorically applied to all. What would be the case if some people tried to live outside of Kantian moral laws and refused moral systems and the obligations that bind them? Kantian normativity in actual searches for the universalized principle, but neither pragmatically nor transcendently. The term “reason” is a universally and objectively valid principle similar to the concept of freedom that Kant vividly installed in his masterpiece to preserve moral laws from two subsequent premises:

- a. Moral laws are *a priori*, so these are necessary statements and deal with pure reason and universal evaluation. This rationalist account of the conceptual truth clenches rationality and reasoning to adapt the categorical imperative.
- b. Implementation of moral laws in human life is based on experience.

Unlike utilitarianism, like Aristotle, Kant also considers that nothing is without reason. It does not mean that we are always rational and reason-based animals in nature, but it invokes a capability approach to pursue something (behavioral exposition) based on rationality and reasoning. For Kant, the positive aspect of freedom is nothing more than the capability of reason-based thinking. Actually, our deliberation opts for free thinking, whereas rationality motivates actions by pure reason.

And the many-sided rational requirement turns toward universal law that is pure reason centric (more intention-based conceptual thought), which could not be avoided by making it context specific. Kant's ideal sphere, where he induces the formula of the *Kingdom of Ends*, has latched on a systematic reason-oriented approach to dealing with different rational agents who are under control by common goodwill and common laws. The underlying scenario is that we are free only when we act from duty, constraining to the common sensual notion that exposes freedom as being unrestrained.

But Kant identifies freedom with duty, the only stimulation of moral act. Acting from desires is to act from intrinsic impulses that are under the control of nature. Only when we choose to obey the moral law can we pull ourselves away from nature's control and act as a free, autonomous, and rational agent. True freedom pins down obeying categorical imperative, dutiful commands, and true moral incentive governed by moral laws. An act is deemed righteous if performed by a duty-bound agent and executed through freedom and goodwill. Goodwill preserves a *a priori* principle-infused actions, so it looks formal while a *posteriori* (experience)-stimulated motive looks material. Through this, it is presumed (as part of the duty) that there is a causal nature of moral

intention and the existence of the highest good, which remains inseparable from the idea of supreme happiness. Lewis White Beck writes, "the highest good (*summum bonum*) consists in the exercise of perfect virtue accompanied by the just degree of happiness" (Beck 1988: 301). For highest good, a consistent hookup of both (virtue and happiness) is a requirement that Kant says is not possible in the realm of nature, but possible in supersensible (noumenal) form. Only then the soul would progress incessantly toward ideal virtue (immortality of the soul), and a moral governor of the world (God) would exist to reward the virtuous with happiness. O'Neill brilliantly points out, "Kant speaks of such perfect co-ordination of moral virtue and happiness as the highest good. Producing the highest good will take a long time: so we have to postulate immortal souls as well as divine providence. This picture has been lampooned time and again" (O'Neill 2002: 180). What is a moral will? Kant argues that moral will coupled with moral laws motivates the highest good (*Kingdom of Ends*).

### Kant's Special Moral Realism: An Antinomy

Turn next to the realism versus antirealism debate, which affects Kantian moral parameters. For the moral realist, there are moral facts, and moral judgments concerning moral facts can be seen to be true or false. For them, moral judgments imply mental cognition, and there are good reasons to generate action. The moral antirealist holds that we cannot judge the truth value of the moral facts since no moral facts correspond to the moral prediction at the objective level. Moral judgments vindicate only our emotional attitudes, because these are emotive and never exemplify any descriptive judgments. Like many others at that time, Kant was fascinated by Hume's argument that every event must have a cause and that has no rational justification. Still, it is a habit of expectation resulting from the constant association of experiences in the past. However, even if Kant is impressed by this view, he is later reluctant to say that the causal laws recognized in the natural

sciences define objective sequences in nature, but epitomize simply subjective experiences in the minds of men.

Why is Kant not an antirealist? The points are appended below:

- Kant denies that emotions are what motivate morality, as the antirealist claims.
- For Kant, knowledge of the good is feasible, since our moral judgments are based on practical reason. Reason is conceived as a capacity of knowledge that is the origin of moral as well as scientific concepts and maxims.

Interestingly, Kant's moral realism does not fit the ordinary notion of realism. First, ordinary moral realism believes in the cognition of a subject that directs toward moral facts. In addition, the subject can intuitively or immediately comprehend the moral qualities of a particular fact. But Kant prefers practical cognition in favor of reasoning that brings the object of cognition to reality. Kant argues against the basis of intuition for knowing the moral facts since he considers that agents have immediate access to moral laws when they encounter maxims for performing an action. Secondly, moral realists typically believe that moral laws are mind-independent; for example, being intrinsically prescriptive, the property of child labors looks as if malicious. Now the query is: Can normative property supervene on the natural property? Perhaps Kant's answer would be yes, as the maxim (universalizability) determines the moral quality of our actions. So, moral facts are mind-dependent and constituted by the agent's mind, even if some interpreters consider that it is the *universalization* of our maxims that does this. Hence, the concept of absolute respect for morality warrants a realist milieu of moral motives (*universally lawgiving will*) toward an objective law regarding what is the right thing to do, despite being foisted upon subjective choices.

It is possible to think, like Christine M. Korsgaard, that Kant's moral realism is a special kind of moral realism, where values may be projected in the world, but goodness was not to be found in the objects themselves, but rather in their

performance (or not) at the behest of the categorical imperative, thus preserving a tie to our rationally based reasoning and subjective choice. Korsgaard writes: "Kant saw that we take things to be important because they are essential to us – and he concluded that we must therefore take ourselves to be important. In this way, the value of humanity itself is implicit in every human choice" (Korsgaard 1996: 122).

## Summing Up

The paradigmatic feature of Kant's metaethical constructivism uploads the merits of unconditioned objectivity anchored in universalized moral principles. Kant comes up with the idea of the categorical imperative, which imposes a constraint (the constraint of universalizability) on our maxims in order to make them morally acceptable. Why might Kant have supposed this? Singer writes, "According to Kant, we act morally only when we have put aside all motives streaming from our desires or inclinations. If duty is not to be 'everywhere an empty delusion,' then 'bare conformity to universal law as such' must serve as the motive for moral action. By 'universal law' Kant meant the moral law – and in particular his famous 'categorical imperative' that tells us to act only in accordance with principles that we would be ready and willing to enact into universal laws. Thus he was saying that we must do our duty for duty's sake" (Singer 1997: 215). The principle of beneficence doubtlessly contains this universal practical law formula of the categorical imperative. Kantian contractualism is a doctrine that envisages adequacy of moral principle anchored in intuitive reasoning to merit the agreement of all rational human beings without any exception. Kant insists on the prior significance to the notion of justice before settling what is good pertaining to virtue in the public sphere for exercising external freedom. But in the exercise of internal freedom, we are the austere agents of moral laws and subject to them, who should act in step with practical reasoning and goodwill regardless of personal interest in all circumstances. Kant is the principal advocate of the contentious idea of

prohibition of lying and deception in any case where an agent's ends are possibly rejected irrespective of the circumstance. The duty not to speak lies should always be morally worthy and legally just to cohesively enforce universal consent of members of society to abide by moral rules rather than any conflicting desires that would invoke depriving other persons of their moral rights and freedom. Kant gets into a mess when he deals with the case of lying in order to save lives, and such. In his paper, "On a Supposed Right to Tell Lies from Benevolent Motives" (Kant 1898), where he falls into his own trap and insists that we are not morally allowed to do this and wrong in the case of consequence-based actions and self-benefits. Needless to say, Kant's challenge to received doctrine collides with any kind of consequentialism instead of the duties that follow from the categorical imperative. This is the true pursuit of goodwill and universal law, capturing the notion of the *synthetic use of pure practical reason* for mankind.

## Laissez-Faire Leaders and Trust

Özge Tayfur Ekmekci  
Business Administration, Hacettepe University,  
Ankara, Turkey

### Synonyms

Faith in leaders; Faith in organizations; Passive leadership

### Introduction

People tend to portray leaders as “someone with charisma and heroic attributes” because of the positive connotation of leadership in their minds. This tendency, however, ignores the fact that many people in positions of leadership act destructively, harming the legitimate interests of followers and organizations. As a result of this realization, scholars have begun to look into the negative aspects of leadership, especially the destructive or dark side of leadership in recent years. The full-range leadership theory (Bass and Avolio 1990) proposes five transformational and three transactional leadership characteristics, as well as one facet that represents a lack of leadership, to embrace both positive and negative/destructive kinds of leadership (Verlage et al. 2012).

Despite the importance of transformational and transactional leadership for organizational and employee results, the purpose of this chapter is to reveal how laissez-faire leadership, or a lack of leadership, undermines trust in management and the organization. The reason for focusing solely on laissez-faire leadership is that, as Aasland et al. (2010) posit, the absence of leadership is more common than real abuse in organizations. By failing to provide their followers with any kind of exchange or orientation, laissez-faire leaders put followers in situations where they do not know how and when to do their tasks (Aasland et al. 2010), thus creating role ambiguities and role strains within the organization. Given the focus on purely constructive (i.e., transformational, charismatic, and authentic leadership) and destructive (i.e., tyrannical and abusive leadership) forms of leadership, it seems worthwhile to explore the role of laissez-faire leadership, whose effects appear to be underestimated in the existing literature.

The purpose of this chapter is to conduct a thorough evaluation of the research on the effect of laissez-faire leaders on followers’ faith in their companies and managers. To begin, the notions of laissez-faire leadership and trust will be briefly discussed to facilitate comprehension and to provide more comprehensive picture. Second, previous study findings on the relationship between laissez-faire leadership and trust will be discussed, as well as a theoretical framework.

## The Concept of Trust

Trust is a multidimensional and elusive concept, which makes it hard to define and conceptualize. In their pioneering article, Mayer et al. (1995) provided a state-based and psychological definition, stressing the dynamic nature of trust and mental mechanisms to deal with uncertainty and associated vulnerability: *“the willingness of a party to be vulnerable to the actions of another party based on the expectation that the other will perform a particular action important to the trustor, irrespective of the ability to monitor or control that other party”* (p. 712). Likewise, Rousseau et al. (1998) conceptualize trust as *“a psychological condition characterized by the desire to accept vulnerability in the face of positive expectations about another’s intentions or behavior”* (p. 395). Despite the abundance of trust definitions, these definitions highlight key elements and commonalities. First, trust entails individuals’ beliefs, assumptions, and expectations about the positive effects of others’ future behavior, therefore it involves the existence of two parties: the trustee (i.e., the party being trusted) and the trustor (i.e., the one who is trusting). Second, trust is a changing and dynamic concept that is based on the trustor’s views of the trustee’s attitudes and conduct. Third, trust is a psychological mechanism that allows people to suspend their doubts about other people’s behavior, making knowledge of another person’s trustworthiness momentarily certain. This allows trustors to take a leap of faith toward positive expectations that would not be justified by good reasons alone (Möellering; cited in Dirks and De Jong 2022).

In addition to its conceptualization, the dimensions of trust are also controversial. McAllister (1995) distinguishes two forms of trust (i.e., affect-based trust and cognition-based trust) based on the premise that the meaning and content of trust may alter depending on the situation. Accordingly, individuals in affect-based trust relationships show genuine care and concern for others, and emotional ties between two parties become the basis for trust. On the other hand, individuals in cognition-based trust relationships assess the other party’s trustworthiness, character, and competence based on accessible clues or direct

knowledge; as a result, evidence-driven processes become the foundation for trust. Unlike McAllister, Mayer et al. (1995) believe trust is one dimensional but distinguish trustworthiness from trust. Emanating from three characteristics of the trustee (ability, benevolence, and integrity), trustworthiness is argued to be an antecedent of trust between the trustee and the trustor. In the ability dimension, the trustor believes that the trustee has the necessary competencies to perform well in a specific domain. The other dimension, benevolence, involves whether the trustor regard the trustee’s behaviors as directed to helping him/her or serving only their self-interest. The final dimension, integrity, shows the trustor’s assessment of the trustee’s behavior in terms of principles and standards, implying that the trustor analyzes the trustee’s integrity by examining whether the trustee follows a set of principles that the trustor considers acceptable (Mayer et al. 1995). Although the conceptual divergence between trustworthiness and trust is still debatable, one needs to comprehend both Mayer et al.’s (1995) and McAllister’s (1995) perspectives to understand the multidimensional and complex nature of the trust-building process.

Trust involves the existence of two parties, therefore scholars should clarify different referents of trust and levels of analysis by looking at the trust from the perspective of both the trustee and the trustor. The trust’s referents, or the party being trusted, could be an individual, a group, management, or the entire organization. These trust referents must be clarified because a trustor is subject to various types of dependencies and thus risks during his or her interactions with the trustee, which makes the trust-building process complex and different. In addition, scholars and practitioners should take note that their level of analysis could matter given that trust at the individual level could be different from trust at the team, group, and organizational level.

## The Concept of Laissez-Faire Leadership

In economics and political science, the phrase “laissez-faire” refers to *“a policy of minimal government intervention in the economic affairs of*

*individuals and society*” (Encyclopaedia Britannica n.d.). Laissez-faire is frequently used in the extant literature to refer to a “hands-off, let things ride” approach to influencing people in the workplace (Northouse 2016). Laissez-faire leaders, in contrast to so-called “ideal leaders” (transformational or authentic leaders), are viewed as ineffectual, unconstructive, and even destructive. This type of leader avoids direct contact with their followers and abdicates responsibility (Bass and Avolio 1990), which is why laissez-faire leadership is also referred to as “non-leadership” (Breevaart and Zacher 2019). Laissez-faire leaders are viewed as ineffectual and damaging because they deny followers access to information and feedback and fail to support them in challenging work situations. Following this inference, it is suggested that laissez-faire leadership has negative repercussions for followers, including increased distress and more conflict with coworkers, as well as decreased job satisfaction, leader satisfaction, and leader effectiveness (Skodgstad et al. 2007).

Laissez-faire leaders fail to provide any type of exchange or orientation to their followers. As a result, followers are placed in circumstances where they are unsure of how to carry out their tasks. Lack of leadership is more widespread in businesses than actual/real abuse (Aasland et al. 2010), yet laissez-faire and its practical consequences are usually disregarded. That is, while scholars have recognized the destructive nature and negative aspects of laissez-faire leadership, few studies (e.g., Skodgstad et al. 2007) have examined the detrimental impacts of laissez-faire leadership on subordinates and organizations.

## Laissez-Faire Leaders and Trust in Organizations

Leadership’s presence, continual support, and input are required for employees’ faith in their leaders and organizations. Leaders and managers can foster a culture of trust by establishing credibility (i.e., doing what they say they will do) and demonstrating consistency (i.e., behaving in a predictable way) (Tosunoglu and Tayfur Ekmekci

2016). Certain leadership activities, such as articulating a shared purpose, direction, and vision, clarifying tasks and responsibilities, communicating frequently and promptly, and establishing high-quality interpersonal relationships, are also said to aid in the development of a culture of trust. In this vein, laissez-faire leaders are said to prevent employees from creating and sustaining trust since they have little or no interaction with those employees (Northouse 2016), do not intervene in difficulties, and do not give timely feedback (Gillespie and Mann 2004). Laissez-faire leaders fail to satisfy the followers’ legitimate expectations as well as create role ambiguities, conflict, and work-related tensions due to their lack of involvement, support, and engagement with their followers (Skodgstad et al. 2007). Unmet expectations and laissez-faire leaders’ hands-off management style may diminish followers’ faith in them.

According to Burris et al. (2008), negative feelings and lack of trust toward a supervisor can spill over into feelings against the organization, resulting in negative feelings and attitudes about the company as well. This argument is plausible because employees view their manager or leader as a representative of the company, causing them to associate negative feelings toward him or her with the entire organization. Working with an unfavorable, inept, or destructive manager/leader may also give employees the impression that the company does not intervene to safeguard them. Such negative attitudes could also destroy trust in organizations day by day.

The social exchange and psychological contract theories could provide theoretical frameworks for explaining the relationship between laissez-faire leadership and trust. According to social exchange theory, reciprocal exchanges between two parties, such as resource transfers or helping acts, have a role in the development of trust (Clarks and Mills 1979). It can be argued that laissez-faire leaders are unable to develop reciprocal exchanges by failing to provide direction and vision to their followers, ensure frequent and timely communication inside the company, and assist followers when needed.

A psychological contract reflects “an individual’s perceptions of the terms and conditions of a reciprocal exchange agreement between that individual and another party” (Rousseau 1989). When employees believe their companies or supervisors fall short of their promises, they suffer a psychological contract breach (Rousseau 1989). According to Rousseau (1989), psychological contract violations erode trust by undermining two fundamental pillars of trust. Integrity is a vital component of trust because it reflects “the perceived consistency of another’s behavior and the degree to which another’s actions conform to his or her word” (Mayer et al. 1995, p. 719). According to Robinson (1996), when an employee perceives a disconnect between management’s words and actions, or when the employee believes the leader or manager lacks integrity, the employee loses faith in the organization’s and leaders’ ability to reciprocate future efforts. By failing to adhere to pledged obligations (e.g., by failing to exhibit concern for employees or by failing to offer counsel), laissez-faire leaders or managers may seem inconsistent to employees, compromising their integrity and leading in psychological contract breaches. As a result, employees’ confidence in their bosses and organizations may dwindle. Along with undermining perceived integrity, psychological contract violations endanger interpersonal connections by casting doubt on supervisors’ or management’s perceived goodness. When leaders or supervisors violate psychological contracts, they undermine the values of “respect” and “concern for one’s own wellbeing,” which are at the heart of all trusting partnerships (Tosunoglu and Tayfur Ekmekci 2016). By demonstrating a lack of concern for the well-being of their subordinates, laissez-faire leaders and supervisors erode trust in themselves and their companies.

Numerous studies have found positive correlations between constructive leadership styles (transformational and ethical leadership) and various trust referents (i.e., organizational trust and supervisor trust). Given that the absence of constructive leadership and accompanying behaviors may imply the presence of laissez-faire leadership, a negative correlation between laissez-faire

leadership and organizational or supervisory trust seems reasonable. Gillespie and Mann (2004) reported a negative correlation between laissez-faire leadership and leader trust, concluding that passive and avoidant leaders forego the opportunity to win their followers’ trust, and if they already have it, their behaviors are likely to destroy it over time. According to the study, laissez-faire leadership behaviors destroy confidence by indicating that the leader is untrustworthy or ineffective and are not actively supporting or achieving the team’s goals.

As indicated before, laissez-faire leadership undermines not only trust in the leader but also trust in the organization. Nevertheless, a recent study (Tosunoglu and Tayfur Ekmekci 2016) reported a negative relationship between a supervisor’s laissez-faire leadership style and organizational trust. Accordingly, employees seem to perceive supervisors’ or leaders’ lack of regard (i.e., laissez-faire behaviors) as a reflection of the organizations’ uncaring attitude toward them, which in turn undermines the faith in those organizations.

Recognizing that a leader may employ both transformational and laissez-faire leadership styles concurrently, Breevaart and Zacher (2019) investigated the main and interactive effects of transformational and laissez-faire leadership behaviors on perceived leader effectiveness and trust. They found that when leaders demonstrated a combination of less weekly transformative and more laissez-faire leadership than normal, trust in the leader decreased. However, when leaders demonstrate more transformational leadership behaviors, followers appear to express a greater level of trust in their leader, regardless of the leader’s laissez-faire conduct. These findings indicate that both transformational and laissez-faire leadership styles appear to have a fluctuating effect on supervisory trust over time, rather than remaining constant. Considering the interplay between transformational and laissez-faire leadership, Breevaart and Zacher (2019) question the common notion that laissez-faire leadership is destructive and always associated with decreased levels of trust. The researchers argue that some leaders adopt a laissez-faire

leadership style and so purposefully avoid interfering with their followers, not because they are incompetent or negligent, but because they have previously motivated followers to work independently.

## Conclusion

This chapter summarizes past research and provides a theoretical framework regarding the plausible relationship between laissez-faire leadership and trust. Laissez-faire leader behaviors are mostly positioned as the opposite of effective leader behaviors (i.e., transformational and transactional leader behaviors). Given the premises of psychological contract theory and negative connotations, laissez-faire leaders are assumed to undermine trust in the organization, management, and managers. However, it should be noted that leadership is affected mostly by how subordinates perceive their leaders/managers, and these perceptions can vary according to context. As Yang (2015) posits, laissez-faire leadership can be interpreted as a sign of ignorance or inattention, yet it can also be interpreted as a manifestation of a leader's respect. Given that laissez-faire leadership can be a strategic choice made by a leader and/or perceived positively by subordinates, a more balanced approach to laissez-faire leadership is required. Therefore, the practitioners and researchers should avoid the implicit negative judgments about laissez-faire leaders (Yang 2015) and their roles in adverse work outcomes.

## Large-Scale Resource Extraction and Violence Against Women

Penelope Simons and Melisa N. Handl  
Faculty of Common Law, University of Ottawa,  
Ottawa, ON, Canada

### Synonyms

Domestic violence; Gender inequality; Human rights defenders; Intersectionality; Large-scale mining; Oil & gas development; Resource extraction; Sexual violence; Sexual violence in conflict; Structural violence; Violence against women; Women's rights; Workplace violence

### Introduction

Resource extraction plays a significant role in the economies of many states and it also produces natural resources crucial for economic activity and contemporary society. Large-scale mining and oil and gas development can increase job opportunities and fuel economic growth. Yet extractive activity also brings with it environmental degradation and human rights violations. It can exacerbate social tensions, ignite or promote armed conflict, and can transform economies from subsistence agriculture to cash-based, disrupting social and cultural norms.

The impacts of large-scale resource extraction are not gender-neutral. Women may be the victims of harms related to resource extraction that are different from those that may be experienced by men. At the same time, it is crucial to acknowledge the agency of women in this context. While

these industries tend to be male-dominated, women are increasingly entering these work forces, which are transforming the political economy of resource extraction (Lahiri-Dutt 2015).

Violence against women is a complex and pervasive global phenomenon. One in three women is affected by gender-based violence globally in its many forms – including physical, sexual, psychological, emotional, economic facets, among others – involving interpersonal, collective, and structural violence. Such violence constitutes the violation of women's human rights, and it has severe consequences for women's physical and mental health, for our communities, and our societies.

The economic and human costs of violence against women are considerable. They include physical and mental health, employment, productivity, criminal justice costs, legal expenses, and women's loss of a sense of safety and security, among many others. It has intergenerational impacts on women and can exacerbate a cycle of poverty and vulnerability, making already vulnerable populations prone to further violence.

The United Nations *Declaration on the Elimination of Violence against Women* defines such violence as “any act of gender-based violence that results in, or is likely to result in, physical, sexual or psychological harm or suffering to women, including threats of such acts, coercion or arbitrary deprivation of liberty, whether occurring in public or private life.” The term “gender-based violence” is often equated with “violence against women” because violence against women is simultaneously a cause and consequence of gender inequality. In turn, gender inequality can manifest itself in many forms. It includes discrimination in opportunities in the political, economic, social, and cultural spheres, unequal responsibilities within and outside the household, limited autonomy of women and control of resources and over their own bodies, restricted or conditional access to power and resources rooted in the sociocultural notion of men as superior to women, restricted access to justice, and no or limited enjoyment of their human rights, which is both a cause and consequence of poverty, marginalization, and poor health conditions. If

women are not economically independent, they may continue to be trapped in a cycle of violence and poverty.

## Large-Scale Resource Extraction and Violence Against Women

Large-scale mining and oil and gas development continue to be male-dominated industries. Women's engagement with, and relationship to, resource extraction is complicated and multifaceted. Women may be employees in extractive corporations, including board members, managers, clerical workers, miners, lawyers who represent extractive corporations, activists who oppose extractive activities, members of communities in which such resource extraction takes place, among other things (Seck and Simons 2019).

The direct and indirect impacts of resource extraction differ between women and men. Gendered impacts may include, among other things: environmental contamination of land and water supplies and the increased workload on women who may have the responsibility of sourcing food and collecting clean water; the effect of toxic contamination on the health of communities and increased burdens on women of caring for sick family members; voluntary or involuntary displacement of communities and the shifts from an agrarian economy to a cash-based economy, both of which may have an impact on gender roles; and an increased risk of violence against women (Jenkins 2014). Such violence appears to be a cross-cutting impact of extractive activity.

Women's experiences of violence in the context of resource extraction are by no means homogeneous. Rather, they may differ by country and region and as between women, depending on a range of intersecting factors, from race to socioeconomic status. However, there is growing evidence that large-scale mining and oil and gas development pose significant risks of violence for women and girls. Additionally, there "appear to be some notable similarities in the causes and the multi-faceted nature of gendered violence associated with mining and oil and gas projects

across the globe" (Simons and Handl 2019). Acts of gender-based violence in the context of resource extraction are linked to "structural gender inequalities that manifest themselves in the subordination of women in society" (True 2012).

## Gendered Violence in the Workplace

Within the extractive industry, men tend to disproportionately obtain highly paid job opportunities. Women may be underemployed, underpaid, and may face additional barriers in seeking promotion because of gender-based bias and discrimination in employment. The few women employed in extractive projects are also affected by an unfair gendered division of labor: they work in occupations traditionally disregarded as "feminine," such as performing as worker's camps cleaners, cooks, housekeepers, laundry services, or providing other support services – jobs that are undervalued and under-remunerated in our societies. The work environment tends to be highly masculinized, and the working conditions for women may be precarious and unregulated including short contracts, long working hours, and no rest. Women working within large-scale mining and oil and gas corporations, whether as miners, rig operators, administrative workers, managers, cleaners, or cooks, may face frequent sexual harassment and/or become victims of sexual assault (Simons and Handl 2019; Eftimie et al. 2009). Sexual violence in the workplace directly affects women's equal participation in the workforce, affecting their physical and mental health and overall productivity, increasing the incidence of trauma, depression, learned helplessness, stress, anxiety, loss of self-esteem and motivation, and loss of a sense of security and purpose, and compromising their financial security. Such violence has far-reaching, intergenerational consequences.

## Domestic Violence

Domestic violence is also associated with resource extraction in a number of ways. First, in some countries, large-scale mining and oil and gas development may bring about significant socioeconomic changes that transform communities and destabilize traditional livelihoods, including

women's status. The structural shift from an agrarian to a cash-based economy can disrupt traditional gender roles, land ownership, and exacerbate power imbalances between women and men (Jenkins 2014). Where communities are displaced, extractive companies may negotiate for property rights or access with male members of the household, even in cases where the land title is held by women and men receive the compensation (Simons and Handl 2019). Men may also be employed by the extractive company. The increase in cash in the hands of male members of the community can often lead to increased alcohol consumption, which may in turn be related to an increase in incidents of domestic abuse (Kotsadam et al. 2017; Jenkins 2014).

Second, large-scale mining and oil and gas projects employ large groups of predominantly male workers who engage in highly paid stressful intensive shift work in remote areas for several weeks at a time. Between shifts, they may return home after bouts of drinking or drug use and then engage in domestic violence (Simons and Handl 2019).

Additionally, where men are hired disproportionately in comparison to women and women are not guaranteed a job, women will be more dependent on men, which increases the likelihood of incidents of domestic violence (Eftimie et al. 2009). This financial dependency increases a woman's risk of being trapped in an abusive relationship. Without access to employment, income-generating land, and restricted access to resources for their own survival, women can become victims of economic violence and more vulnerable to other types of violence.

### **Violence Against Women in Local Communities**

Large-scale mining and oil and gas development also creates a heightened risk of sexual violence for women living in and around extractive projects or in urban centers that serve as hubs for extractive activity. The arrival of large numbers of transient male workers has been shown to result in increases in violence against local women including Indigenous women. Such violence

includes sexual violence and trafficking of women (Simons and Handl 2019). In addition, security forces engaged in protecting the assets of extractive operations may perpetrate human rights violations against members of local communities, including engaging in rape and gang-rape of women and girls as an intimidation tactic. Major extractive corporations have been denounced and even sued for such egregious acts of sexual violence.

Resource extraction is also linked to conflict. Large-scale extractive projects may create or exacerbate local tensions as well as foment and fuel violent conflict. It is widely recognized that that women face a high risk of violence, including sexual violence in conflict and post-conflict situations. At the same time, it is important to recognize that "gender-based sexual violence perpetrated in situations of conflict is not an aberration," but rather reflects the structural nature of women's inequality and oppression. Indeed, gender-based violence is an everyday and every night risk for women (Simons and Handl 2019).

### **Intersectional Experiences of Violence Associated with Resource Extraction**

Nowhere in the world are women exempted from gender-based violence. However, poor women belonging to marginalized groups, such as Indigenous peoples, migrants, refugees, human rights defenders, ethnic or racial minorities, those with disabilities, or those living in conflict situations, are generally more vulnerable to violence. This violence is experienced differently in intensity because of compounding and overlapping intersectional identities (Crenshaw 1989). For example, Indigenous women and girls face specific challenges and obstacles due to intersectional discrimination.

The expansion of extractive industries into Indigenous peoples' territories has deeply affected these communities economically, culturally, socially, and spiritually (Morales 2019). Large-scale resource extraction projects, which employ high numbers of transient shift workers with high salaries bring with them increased alcohol and drug abuse; increases in crime, sex work,

and trafficking of Indigenous women; as well as incidences of rape of Indigenous women. In addition, the desecration and pollution of Indigenous lands, and the exacerbation of socioeconomic dependence of women on men, may lead to domestic violence within such communities (Final Report: Reclaiming Power and Place 2019).

Women human rights defenders also suffer compound experiences of discrimination and suffer violence more intensely because of the intersection of their gender, sex, class, ethnicity, marital status, public persona, and status within their communities, among other factors. In fact, although women human rights, environmental, and land defenders are a diverse group, similar types of violence (often deadly violence) is perpetrated against these women by corporate actors often with the support of governments (Le Tran et al. 2020).

Furthermore, Indigenous women human rights defenders are especially vulnerable. They face violence including sexual violence, criminalization within the justice system, stigmatization, marginalization, among other acts from within their community all intended to silence them. Indigenous women human rights defenders who face extractive industries simultaneously challenge corporate power, patriarchy, colonialism, and indigenous traditions by engaging in public advocacy and vocalizing the concerns of their communities (Simons and Handl 2019). They are subject to intersecting levels of discrimination because they are women, Indigenous, and public advocates who are challenging powerful economic actors and governments.

The connections between the extractive industry, physical and sexual violence, and women's exploitation are not merely coincidental. Within the extractive industries, deeply rooted patriarchal social relations of power between women and men are constructed and exacerbated to extremes. "Supernormal profits" exacerbate and rely on "supernormal patriarchy," whereby transactional sex and women's roles as workers, sex workers, or wives are significantly reinforced (Bradshaw et al. 2017).

## Structural Violence and the International Legal System

The international legal system forms part of the structures that perpetuate women's inequality and oppression, and that enable violence against women. International law does not adequately address gender-based violence and states have not done enough to implement their international legal obligations to respect, protect, and fulfill the human rights of women, including the right not to be subject to discrimination. States have developed international law to protect and facilitate transnational business activity. Yet many states continue to insist that regulation through soft norms and mechanisms is the most appropriate way to address corporate conduct that adversely affects human rights (Simons 2017). Most multi-stakeholder and intergovernmental initiatives that purport to address transnational corporate conduct in the absence of adequate domestic regulation and binding international law, including the United Nations Guiding Principles on Business and Human Rights, ignore gender or fail seriously to consider it. They do not sufficiently address the differentiated impacts of corporate-related violations of human rights on women, corporate complicity in gender-based sexual violence, or the structural inequalities that oppress women. What has resulted is an ongoing governance gap that leaves women vulnerable to violence (Simons and Handl 2019).

## Conclusion

Large-scale resource extraction projects can bring benefits to communities and states. However, they also increase the risk of violence against women. The gendered impacts of resource extraction are complex and multifaceted. Women may face harassment, discrimination, and sexual violence in the workplace. They may be trapped in abusive domestic relationships and subject to increased violence from their intimate partners employed within the industry. They may suffer sexual abuse at the hands of transient workers or security forces protecting the extraction infrastructure. They may experience limited access to resources

and be burdened with the gendered division of labor at the family and community level. Women's health may be negatively impacted. They may suffer because of forced displacement, conflict, land-grabbing, and environmental pollution. They may experience the intensity of intersectional discrimination and violence when facing powerful corporate and governmental actors and disrupting patriarchal norms. Women can be victims and survivors and simultaneously resist and exert their agency at the individual and collective level.

Such violence against women is the result of, as well as a contributor to, structural gender inequalities (True 2012). States need to address the patriarchal structures that perpetuate the oppression of women. They must also address corporate impunity by taking adequate legislative and other measures to regulate domestic and transnational extractive activity and provide effective remedies, taking into account the gendered impacts of such resource extraction. States should also engage in good faith in the current negotiations at the United Nations for a treaty on business and human rights. Such a treaty is a necessary step toward gender justice, which demands corporate accountability. However, simply adding reference to women as an afterthought – the “add women and stir” approach – or paying only “special attention” to women and “other” disadvantaged groups in certain contexts in domestic law and policy reform and in the treaty negotiations is insufficient. Transformative measures will be needed to prevent and address gender-specific risks of resource extraction, meeting women's symbolic and material needs, and ensuring justice is accessible to women. What is necessary are their rights and nothing less.

## Leadership Development

Richard Barrett  
Barrett Values Centre, London, UK

### Synonyms

Psychological development; Sustainable growth; Values-based leadership

### Introduction

No one is born a leader. A leader is someone you become: not in the same way you become an engineer, businessman, a dentist, or a doctor. It is a role you grow into. Some people naturally grow into leadership roles; some go all out to seek a leadership role and others have leadership thrust upon them. Some, like me, choose not to be a leader of people, but a leader of thoughts. Whatever the case, the journey to becoming a *successful* leader is the same; there are seven stages of psychological development you must master to become a great leader. If you fail to master a particular stage, you will not become a great leader. You may become a good leader or a

recognized leader, but you will not be remembered as a great leader. Becoming a great leader is the journey of evolutionary leadership through ego development to soul activation (Barrett 2010).

### Overview

Every person on the planet follows the same evolutionary path during the first 24 years of their lives. This is called the journey of ego development. There are three stages to this journey, learning how to survive, learning how to keep safe, and learning how to feel secure. The extent to which you are able to master these stages of development affects your ability to master the last three stages of psychological development – the stages of soul activation.

The fourth stage of your journey is the bridge between the ego stages of development and the soul stages of development. This stage, which begins in your mid-20s and continues through to your late 30s, is called individuation. During this stage of development, you learn to master the fears you developed during the first three stages of development so that you can become an adaptive, viable, independent individual. Only when you have successfully mastered this stage of development are you fit to embark on the last three stages of development and learn how to become a great leader.

To master the soul activations stages of development, you must learn how to self-actualize – find your purpose and express your unique gifts and talents, make a difference by connecting with others in unconditional loving relationships, and serve the greater good through continuously contributing acts of selfless service.

### Leadership Development

From a leadership development perspective, we can split this journey into four stages: individuating, self-actualizing, integrating, and serving (Barrett 2014, 2016).

**Leadership Development, Table 1** The stages of psychological development

| Stages of psychological development | Age range        | Developmental task                                                                 | Motivation                                       | Developmental focus |                 |
|-------------------------------------|------------------|------------------------------------------------------------------------------------|--------------------------------------------------|---------------------|-----------------|
|                                     |                  |                                                                                    |                                                  | Internal            | External        |
| Serving                             | 60+ years        | Alleviating suffering and caring for the well-being of humanity and the planet     | Satisfying your need for selfless service        | Compassion          | Contribution    |
| Integrating                         | 50–59 years      | Connecting with others in unconditional loving relationships                       | Satisfying your need to make a difference        | Empathy             | Connection      |
| Self-actualizing                    | 40–49 years      | Expressing your true nature by embracing your soul's values and purpose            | Satisfying your need to find meaning and purpose | Authenticity        | Self-expression |
| Individuating                       | 25–39 years      | Discovering your true identity by letting go of your dependence on others          | Satisfying your need for freedom and autonomy    | Responsibility      | Accountability  |
| Differentiating                     | 8–24 years       | Establishing yourself in a community by displaying your gifts, skills, and talents | Satisfying your need for respect and recognition | Security            | Achievement     |
| Conforming                          | 2–7 years        | Feeling safe and protected by staying close to your kin and your family            | Satisfying your need for love and belonging      | Safety              | Harmony         |
| Surviving                           | Birth to 2 years | Staying alive and physically healthy by getting your survival needs met            | Satisfying your need for physiological survival  | Health              | Survival        |

Depending on the lens through which you view leadership development, you can say these four stages are (a) an evolutionary journey of psychological development, (b) an evolutionary journey of spiritual development, or (c) an evolutionary journey of personal fulfillment. Whatever lens you use, it is impossible to avoid the importance of mastering the ego-soul dynamics of the stage of development you are at and the stages of development you have passed through where you still have unmet needs, because the mastery of each stage of development is a necessary prerequisite for the mastery of the following stage. If you fail to master one stage, you will need to go back, review, and adjust the changes you made to your values and beliefs in the previous stage in order to move forward.

In this respect, the individuating stage is paramount. You will find yourself constantly returning to this stage of development as you move through

the higher stages of development. This is because we cannot self-actualize if we still have survival fears from the first stage of ego development; we cannot integrate, if we still have relationship fears from the second stage of ego development; and we cannot find fulfillment through acts of selfless service, if we still have self-esteem fears from the third stage of ego development. With this context, we are now in a position to understand the seven stages of psychological development which are summarized in Table 1.

## The Seven Stages of Psychological Development

### Surviving (0–2 Years)

The quest for survival starts before the human baby is born; it begins in the womb. From the moment the reptilian mind/brain becomes

functional, around the end of the first trimester of gestation, the primary focus of the mind of the fetus is survival.

Because of its species programming, the fetus, and later the baby, instinctively knows how to regulate its body's internal functioning, how to suckle once it is born, and how to signal to its mother that it has unmet physiological needs. At this stage of development, the baby is completely dependent for its survival on its mother or other primary caregivers.

The first thing the baby has to learn, as soon as it is born, is to interact with the world around it so it can get its survival needs met. If the infant finds this task difficult or challenging because its parents or caregivers are not vigilant, or if it is abused or left alone or abandoned for long periods of time, the infant may form subconscious fear-based beliefs that the world is an unsafe place and that it is not loved.

Thereafter, throughout his or her life, this person will seek to control their environment and relationships to assure their needs get met. Such a person will be cautious and vigilant and have a tendency to control or micromanage whatever is happening in their world. They may also be impatient and demanding about getting what they want. If the hardships suffered during this stage of development are severe, this person will be suspicious of the intentions of others and may have much suppressed anger which they project onto others when they don't get their needs met later in life.

If the infant's parents or caregivers are attentive to its needs and are watchful and responsive to signs of distress, then the child will grow up with the feeling that the world is a safe place and people can be trusted. Feeling competent and confident about taking care of your needs is an essential prerequisite for mastering the self-actualization stage of development later in life.

### **Conforming (2–7 Years)**

Toward the end of the surviving stage of development, the child becomes mobile and learns to communicate. This is the time when the limbic mind/brain, also known as the emotional mind, becomes dominant. The focus of the limbic mind/

brain is on physical and emotional safety – keeping the body safe from harm and satisfying its need for love and belonging. Thus begins the conforming stage of development.

At first, the child rebels: it wants what it wants when it wants it. It has not yet learned that the people it depends on for its survival and safety also have needs. To get its needs met, the child learns to follow the rules laid down by its parents. It learns that life is more pleasant and enjoyable, less threatening, and less difficult, if it can live in a state of harmony with its caregivers and siblings.

Conforming – obeying the rules – has benefits: it allows the child to meet its physical and emotional safety needs. Participating in family rituals are also important at this stage of development because they contribute to the child's feeling of belonging and safety. If the parents make the child's adherence to rules conditional on the child getting its desires met, or the child is coerced into behaving in specific ways, the child will learn that love is conditional.

If, because of poor parenting or lack of attention, the child feels unloved, unimportant, not accepted, and not protected or it doesn't feel a sense of belonging, the child may develop the subconscious fear-based belief that it is unlovable. When you do not get your safety needs met at a young age, they do not go away; they are imprinted in the subconscious memory of your emotional mind. As an adult, you become subconsciously needy, always searching for love or wanting to be liked. You will blame others for your mistakes because you desperately need the love and adoration of the authority figures in your life.

If the child's parents or caregivers are attentive to the child's needs and if it is raised in a caring, loving environment, where it feels safe and protected, then the child will grow up with the desire and willingness to form committed relationships when it reaches adulthood.

Learning to feel safe, comfortable, and loved is an essential prerequisite for mastering the integrating stage of development later in life. If you don't feel safe with others – if you have fear-based beliefs about your emotional safety in the presence of strangers – you will find it difficult to reach out and connect later in life.

### **Differentiating (8–24 Years)**

Around the age of 7 or 8, the neocortex mind/brain becomes functional and dominant. The focus of the neocortex mind/brain, also known as the rational mind, is on physical and emotional security. Thus begins the differentiating stage of psychological development.

At this stage of development, the child is beginning to explore the world outside of the home. Whereas parental and sibling relations were of significant importance to satisfy the child's safety needs when the locus of its life was the parental home, relations with peers and authority figures, such as teachers, now take on added importance.

Once a child enters a community outside the home, it can no longer rely on its parents for its personal safety. It takes responsibility for its self-protection by belonging to a group, community, or gang. This means building friendships, fitting in, and being respected by members of the group. Taking on dares can become a rite of passage for membership of some groups in the teenager's or young adult's world. This may lead young people "off the straight and narrow." They may do things they know to be wrong simply to belong to a group where they can feel recognized and secure.

Feeling respected and recognized by parents or members of a group enables us to establish a feeling of self-worth; feeling accepted and acknowledged gives us a sense of belonging and security. The gifts, skills, and talents that allow us to feel recognized become important to us. We focus on them because they are our passport to security.

The types of gifts or talents we develop depend to a large extent on the type of community we belong to. These could include beauty, intelligence, strength, sporting ability, musical ability, fearlessness, etc. Developing our strengths – the things that bring us recognition – allows us to establish ourselves in a community. If, however, we want to become the group leader, we need to stand out from the crowd. We may need to prove our superiority or defend ourselves from those who also want to lead the group.

What is important at this stage of development is exploring your talents and getting positive

feedback and appreciation for your efforts. If your efforts are not appreciated by those who are important to you, particularly your parents and teachers, you will stop trying and may begin to develop a low sense of self-esteem. If, instead of having your efforts appreciated, you are constantly reminded of your failures, you will grow up lacking in confidence, with a low sense of self-worth, and with the belief that you are not good enough.

When you do not get your security needs met in your childhood or teenage years, they do not go away; they remain in your subconscious mind. Later in life, you will either become highly competitive or seek status or power so you can be acknowledged as someone important or someone to be feared, or you will hold back, never speak, and hide in the shadows.

If you do not get the approval and feedback you need from your parents, you may seek out groups, gangs, or communities where you feel accepted and valued and where your gifts, skills, or talents are recognized. This may create conflict in your life at home because you may get caught between two value systems: the values of your parents and the values of the group with which you identify. If this situation is not handled sensitively by your parents, your home life will become difficult and may become intolerable. You will rebel.

From a parental perspective, guiding rather than controlling, allowing rather than preventing, encouraging rather than denigrating, and trusting rather than doubting give teenagers the space to safely explore who they are and find their sense of identity in the larger world outside the family home.

Feeling physically and emotionally secure in your community – being respected and recognized by others – is an essential prerequisite for mastering the serving stage of development later in life. If you don't feel confident and secure in your community, you will not be able to contribute.

### **Individuating (25–39 Years)**

Around your mid-20s, you begin to feel a new impulse: you want to explore who you really are.

You want freedom and the feeling of independence. To do this, you must let go of your parental programming and cultural conditioning and find your own way in life.

If you can transition through the first three stages of development without experiencing any significant trauma or without developing too many subconscious fears, you will find it relatively easy to establish yourself as a viable independent adult in the social and cultural framework of your existence.

So long as you can find opportunities to earn a living that allow you to explore your freedom and work that gives you autonomy, everything will be fine. If you cannot find work that allows you to taste your independence, you will feel demoralized or dispirited.

The task at the individuating stage of development is to find your authentic self. You are finished with being dependent; you are seeking to become a viable, independent adult. You are no longer looking for the validation of others to feel good about yourself. You want to be responsible and accountable for every aspect of your life; you want to embrace and express your values. Without realizing it, you are disembedding yourself from your parental and cultural background and beginning to align the motivations of your ego with the motivations of your soul.

This shift from dependence to independence can be one of the most difficult stages of human development to master because it brings us face to face with our survival, safety, and security fears. Many find it difficult to extract themselves from the influence of their parents; others, such as those who live in authoritarian or repressive regimes, may be afraid to express themselves because they know they can be locked up or lose their life for speaking their truth or expressing any sexual preferences that go against the norm.

If you were fortunate enough to have been brought up by self-actualized parents and to have lived in a community or culture where freedom and independence are celebrated, where higher education was easily available, where men and women are treated equally, where differences are valued, and where you are encouraged from a young age to express your needs and think for

yourself, you will find it relatively easy to move through the individuating stage of psychological development.

If the contrary is true; if you were brought up by authoritarian parents; if you do not live in a democratic regime; if you are discriminated against because of your gender, sexual preferences, religion, or race; and if you developed fears about not being able to meet your survival, safety, or security needs, you are likely to have difficulties moving through the individuating stage of development. Struggling to survive and seeking the safety and security you did not get when you were young can keep you anchored in the lower levels of consciousness all of your life.

#### Leadership Development Goals at the Individuating Stage of Development

The primary leadership development goals at the individuating stage of psychological development are (a) to know yourself, identify your most important values and the behaviors that align with those values, (b) become responsible and accountable for every aspect of your life, and (c) learn to manage your feelings and develop your emotional intelligence skills. In addition, you will want to be given challenges that allow you to explore your gifts and talents – opportunities to find out what you are good at and like doing and what you are not so good and do not like doing. Without such challenges, you will become depressed and dispirited.

I was very fortunate in this regard, because when I was 26, I was asked by the prestigious British engineering firm I worked for to open an office in Paris. I learned during the next 5 years that I was good at my work and good at getting work, but I did not enjoy managing people. I swore after that experience that if I ever started a company of my own, I would not employ many employees. I also realized during this period of my life that I was in love with my own creativity. I was never happier than when I was using my mind to find solutions to intractable problems.

#### Self-Actualizing (40–49 Years)

When you reach your 40s, sometimes a little earlier and sometimes a little later, your soul begins

to make its presence felt in your life. If you have mastered your survival, safety, and security needs and have successfully moved through the individuating stage of development, you will start to search for meaning and purpose in your life; you will be looking for a vocation or calling that allows you to fully express your authentic self. Welcome to the self-actualizing stage of development (Maslow 1968).

For most people, finding their vocation or calling usually begins with a feeling of unease or boredom about their job, profession, or chosen career – with the work they thought would enable them to feel secure by providing them with a good income and prospects for advancement leading to increased wealth, status, or power. Uncovering your soul's purpose not only brings vitality to your life; it also sparks your creativity. You will become more intuitive and spend more time in a state of flow, being totally present to what you are doing and feeling committed and passionate about your work (Jung 1933).

Some people find their vocation early; others discover it much later; some spend their whole lives searching. Uncovering and embracing your soul's purpose is vitally important because it is the key to living a fulfilling life.

Mastering the self-actualizing stage of development can be challenging, especially if your vocation or calling offers less security than the job, profession, or career you trained for earlier in your life. You may feel scared or uncomfortable embarking in a new direction that does not pay the rent or finance your children's education but does bring meaning and purpose to your life.

Your ability to manage your survival needs will significantly influence your ability to make progress at the self-actualizing stage of development. Knowing you can take care of yourself gives you the confidence you need to explore your self-expression. If you are afraid that you might not be able to survive doing what you love to do, you may deny your soul expression.

The subconscious beliefs you learned during the surviving stage of development play an important role at this time in your life. If you have any subconscious fear-based beliefs that the world is

an unsafe place, you will tend to err on caution; you will not take risks. You will never reach your full potential. This will lead to suffering later in life. If you have any fear-based beliefs about meeting your survival needs, they will show up at this stage of your life.

#### Leadership Development Goals at the Self-Actualizing Stage of Development

The primary leadership development goals at the self-actualizing stage of psychological development are (a) to release any fears you have about fully expressing who you really are, (b) to find your purpose in life, the work that you love to do, and (c) to align your work with your purpose.

By the time I reached my mid-40s, I had reached the top of my profession. I was a full-time advisor to the World Bank on matters of urban transport planning and engineering. It was precisely at this moment I became bored with my career. I realized my passion lays elsewhere. I had learned that I did not want to manage people and that I was no longer interested in engineering. I quickly realized, having spent some time thinking about it, that what I was passionate about was transformation, not transportation. I realized that I had been studying psychology, spirituality, and philosophy all my life. During the next few years, I wrote a couple of books on personal and corporate transformation, invented a way of measuring consciousness by mapping values to the seven levels of consciousness model, and left the World Bank. It took me 7 years to work through this process.

#### Integrating (50–59 Years)

If you learned how to master your survival, safety, and security needs and were successful in traversing the individuating and self-actualizing stages of development, when you reach your 50s, you will want to embrace your soul's purpose by making a difference in the world. To do this, you will need to connect with others and to form unconditional caring relationships with those you want to help and those you want to collaborate with to leverage your impact in the world. Welcome to the integrating stage of psychological development.

Connecting with others who share your passion and purpose and connecting with those who will be the beneficiaries of your gifts and talents are essential components of this stage of development. To connect with and support others, you will need to tap into your empathy skills. You will need to feel what others are feeling if you are truly going to help them.

At this stage of development, you must be able to recognize your limitations, cooperate with others, assume a larger sense of identity, and shift from being independent to being interdependent.

Some people get so wrapped up in themselves and their calling at the self-actualizing stage that they are unable to make this shift. They get lost in their own creativity, focusing only on their self-expression, rather than the larger contribution they could make if they connected with others. There is nothing wrong with this approach; however, in normal circumstances, learning to work with others in service to the common good is more likely to bring a sense of fulfillment to your life than working on your own.

How well you mastered the conforming stage of development will significantly influence your progress through the integrating stage of development. Being in touch with your feelings and knowing you can handle your relationship needs – knowing you are lovable – give you the confidence to create unconditional loving relationships with others later in life. If you have any fear-based beliefs about feeling loved, they will show up at this stage of your life.

#### Leadership Development Goals at the Integrating Stage of Development

The primary leadership development goals at the integrating stage of psychological development are (a) to release any fears you have about forming unconditional loving relationships, (b) to develop your empathy and social intelligence skills, and (c) to connect with others to make a difference in the world.

I realized by the time I reached my mid-50s that if I wanted to make a significant difference in

the world, I would need to connect with other like-minded people who were interested in transformation. I set up the Barrett Values Centre and started promoting the Seven Levels of Consciousness Model<sup>®</sup> and the associated Cultural Transformation Tools<sup>®</sup>. We developed partnerships with individuals all over the world to train people in the use of the Cultural Transformation Tools. Within a few years, we were working in 25 different countries.

#### Serving (60+ Years)

The last stage of development follows naturally from the integrating stage. This is the serving stage of development. This stage of development usually begins to occur in your early 60s, sometimes a little earlier and sometimes a little later. The focus of this stage of development is on selfless service to the community you identify with. It is about making a contribution. It does not matter how big or small your contribution is, what is important is knowing that your life has a purpose. Alleviating suffering, caring for the disadvantaged, and building a better society are some of the activities you may want to explore at this stage of your life.

As you enter the serving stage of development, you will find yourself becoming more introspective and reflective – looking for ways to deepen your sense of connection to your soul and whatever you consider divine. You may become a keeper of wisdom, an elder of the community, or a person to whom younger people turn for guidance or mentoring.

As you make progress with this stage of development, you will uncover new levels of compassion in your life. You will experience a deep sense of meaning and feelings of fulfillment and well-being that you never experienced before. You will begin to see how connected we all are and how, by serving others, you are serving your larger self. At this level of consciousness, giving becomes the same as receiving.

How well you mastered the differentiating stage of development will significantly influence your progress through the serving stage of

development. Having a healthy sense of self-esteem will give you the confidence to go out into your community and make your skills, gifts, and talents available to those who need them. If you have any fear-based beliefs about your self-worth, they will show up at this stage of your life.

#### Leadership Development Goals at the Serving Stage of Development

The primary leadership development goals at the serving stage of psychological development are (a) to release any fears you have about your self-worth, (b) to develop your compassion skills, and (c) to let yourself be guided by your soul's inspiration.

Having spent 8 years building up and managing the Barrett Values Centre, it was time to focus on my real passion; it was time to liberate myself from managing people and unleash my creativity. One of my colleagues took over as the CEO of my company, and I became Chairman. This freed me up from the day-to-day management of the company and allowed me to focus on becoming a thought leader in field of values, culture, and leadership. From my mid-60s to the present day, I have written six books – a book every year. This is my contribution to building a better world. Every day, I wake up full of purpose and can't wait to get to work. I have never been happier and more fulfilled Vailant (1977, 2012).

## Conclusion

Each stage of development represents an expansion of consciousness. The more conscious you are, the more ability you will have to manage complexity. If you never make it past the individuating stage of development, the best you can hope for is to become a good manager. If you are able to individuate and self-actualize, you may become a good team leader. If you are able to individuate, self-actualize, and integrate, you may become a good organizational leader. But to be remembered by society as a great leader, you will need to master the serving stage of development (Barrett 2013).

## Leadership Integrity

Michael Palanski

Saunders College of Business, Rochester Institute of Technology, Rochester, NY, USA

## Synonyms

Behavioral integrity; Ethical leadership; Leadership ethics

## Definition

Integrity in leadership is a frequently used term but is often ill-defined and used to represent a variety of concepts such as wholeness, consistency of words and actions, consistency in adversity, being true to oneself, or as general moral or ethical behavior. At its heart, though, leadership

integrity involves a leader's identity-conferring commitment to a particular set of values.

## Description

Palanski and Yammarino (2007) summarized and critiqued the ways that the word "integrity" is used in leadership research and practice. Their summary is a helpful orientation to a broad overview of leadership integrity. Later, Bauman (2013) argued for a more narrowly defined and robust definition of integrity as an identity-conferring commitment to a particular set of values. Leadership integrity is generally valued as an important attribute in most cultures, but the particular aspects of integrity are more or less important, depending on the particular culture (Martin et al. 2013).

Leadership integrity is important because it gives followers a sense of confidence and trust in the leader. Specifically, the display of integrity fosters a sense of credibility (Simons 2002), and attributions of integrity act as a powerful proxy for missing information about a leader (Moorman and Grover 2009).

## Various Meanings of Integrity

### Integrity as Wholeness

Sometimes integrity is used to represent a sense of completeness; for example, the hull of a ship has integrity when it is watertight. When used to a sense of wholeness, integrity implies an overall sense of good character in a leader.

### Integrity as Consistency of Words and Actions

Integrity sometimes implies that a leader "talks the talk and walks the walk." In other words, the leader demonstrates consistency between words and actions. Simons (2002) coined the term "behavioral integrity" to represent a perceived consistency between words and actions specifically, between espoused and enacted values, and promise-keeping. Behavioral integrity is generally a robust predictor of leader effectiveness.

### Integrity as Consistency in Adversity

Some writers have argued that in order for integrity to truly be integrity, the leader must maintain consistent behavior in the face of adversity. Put another way, anyone can maintain consistency under normal conditions, but only a person with integrity can do so under adversity. This meaning of integrity is very similar to the virtue of courage.

### Integrity as Being True to Oneself

"To thine own self be true" summarizes this use of integrity. Proponents of this definition hold that a person of integrity must always act according to his/her conscience. This meaning of integrity is closely related to a sense of authenticity.

### Integrity as Moral or Ethical Behavior

Sometimes integrity is used as a synonym for a general sense of moral or ethical behavior, and the phrase "a leader of integrity" denotes a leader who acts in a moral or ethical manner. At other times, integrity is used as a synonym for more specific ethical actions such as being honest, trustworthy, just, respectful, open, or caring.

## A More Robust Definition of Integrity

### Identity-Conferring Commitment

Given the variety of ways integrity is used in the leadership field, Bauman (2013) argued for a more focused, robust definition of integrity as *an identity-conferring commitment to a particular set of values*. Identity refers to a person's self-concept about who one is and is not, involving both present (who one is today) and future (who one wished to become tomorrow). Thus, integrity involves a deep commitment – so deep, in fact, that it affects one's identity. Put more simply, it means, "In order for me to be truly me, I must maintain this commitment to a particular set of values." The type of values to which one commits helps to shape a particular form of integrity (Bauman 2013).

## Forms of Integrity as an Identity-Confering Commitment

### Substantive Leadership Integrity

Substantive leadership integrity involves identity-conferring commitments to moral values, that is, values that members of a moral community expect all members to follow. These values include honesty, respect, fairness, trustworthiness, and benevolence. Substantive leader integrity normally results in trust in the leader.

### Personal Leadership Integrity

Similar to the notion of integrity as being true to oneself, personal leadership integrity involves commitment to a set of values that are neither moral nor immoral in and of themselves *but for a particular individual take on the importance of a moral commitment*. These values could involve many forms, such as life goals (e.g., serving in a developing country), lifestyle choices (e.g., recycling), or religious principles (e.g., eating only certain foods).

### Formal Leadership Integrity

Formal leadership integrity may be thought of as pseudo-integrity or a shadow of integrity, as it involves commitment to a set of immoral principles. It may, for example, involve commitment to harm others or to advance one's own interests at all costs. This conceptualization is especially helpful for answering well-worn questions such as "Did Hitler have integrity?" The answer to such a question would then be "yes" but only in a formal sense.

## Summary

Leadership integrity is recognized as a universal characteristic of good leaders and is important because it provides other with a sense of confidence and trust in the leader. Integrity is sometimes used as a synonym for wholeness, consistency of words and actions, consistency in adversity, being true to oneself, or general ethical behavior, but at its heart, it is best defined as an

identity-conferring commitment to a particular set of values.

## Leadership Moral Foundations

Maxim Egorov and Armin Pircher Verdorfer  
TUM School of Management, Technical  
University of Munich, Munich, Germany

## Synonyms

Ethical leadership; Moral foundations; Moral intuition; Moral pluralism

## Definition

The moral foundations theory [MFT] is a social psychological theory aiming at describing and explaining the origin and differences in human morality (Graham et al. 2013). Rooted in Haidt's

(2001) social intuitionist model and Shweder and colleagues (1997) theory of the “three ethics,” MFT is characterized by four main propositions: first, human morality is partially innate; second, innate predispositions are shaped within a particular culture; third, ethical decision-making is strongly influenced by intuitive factors; and fourth, moral judgment is based on different moral foundations.

By considerably challenging established theoretical positions in the field of morality research, the MFT has gained increasing attention in both basic and applied research and offers important implications for the ethical dimension of leadership.

## Description

A major focus in research on human morality is how moral judgments occur and what are the underlying processes. Over the last years, behavioral ethicists have started to challenge the predominantly rational and normative approach to ethical decision-making. This position was explicitly reflected in Rest’s (1986) four component model of moral behavior, which is among the most widely used frameworks in research on ethical behaviors in organizations. According to this model, moral competence includes the ability to recognize moral issues in a given situation (i.e., moral awareness), the determination of the ideal course of action (i.e., moral judgment), the motivation to act accordingly (i.e., moral motivation), and sufficient perseverance to execute and implement the selected course of action (i.e., moral character). However, a growing body of research has expanded this perspective and reframed ethical decision-making around dual processes of moral reasoning and automatic, intuitive reactions (Haidt 2001; Reynolds 2006). The particular focus of the MFT is on the description, analysis, and explanation of these intuitive affective reactions and their implications for ethical decision-making.

## Key Claims of MFT

### Innateness of Morality

A main tenet of MFT is that human morality may not be appropriately understood solely as a

product of socialization and learning processes. Rather, the MFT proposes that individuals are born with predispositions for specific moral intuitions, which are then shaped by external factors such as social and cultural influences and individual experiences (Haidt and Joseph 2004, 2008). This claim does not imply a final and unchangeable innate character of morality, though it accentuates dispositional structures “organized in advance of experience,” promoting a certain trajectory of development (Graham et al. 2013, p. 7). Within the MFT, moral knowledge represents a function of adaption processes referring to recurring social challenges faced by a species over long periods of time. Thus, not all possible forms of “utopian morality” (Graham et al. 2013) can develop and not all values and standards be learned equally. Accordingly, Marcus (2004) has compared moral intuition with a book, whose first draft is written by the genes and then revised by experiences.

### Moral Culturalism

Moral culturalism focuses on the cultural impact on moral foundations. Children are born with predispositions for specific moral foundations, which are then shaped by experiences within a specific cultural environment (Haidt and Joseph 2004, 2008; Graham et al. 2013; Shweder et al. 1997). Even though people’s moral concerns around the world rely on the same basic foundations, there is a high variance in terms of occurrence and relative strength. Children within a certain culture grow up surrounded by cultural practices, related values, beliefs, and rules. These factors may enhance the formation of certain foundations and determine the development of a narrow or pluralistic perspective on morality. It is important to note that this “cultural knowledge” is not limited to explicit contents, nor is it always explicitly taught to children. Rather, adopting and acquiring cultural knowledge widely relies on processes of implicit learning, observing, imitating, and participating in culture-specific activities and practices, often without a conscious intention to learn (Haidt 2001).

### Moral Intuitionism

Whereas traditional approaches in the field of human judgment have seen the underlying processes ruled by rational and conscious moral reasoning (Dember 1974; Kohlberg 1981; Neisser 1967; Rest 1986), the MFT stresses the key role of intuitive and non-deliberative processes in ethical decision-making. The MFT conceptualizes moral judgments as an interplay of two processes, moral intuition and moral reasoning. Moral intuition can be defined as “the sudden appearance in consciousness of a moral judgment, including an affective valence (good-bad, like-dislike), without any conscious awareness of having gone through steps of searching, weighing evidence, or inferring a conclusion” (Haidt 2001, p. 818). Importantly, the MFT explicitly states the primacy of moral intuition in every process of moral judgment. This means that before a person can start a conscious evaluation, an intuitive and automatic response to the stimulus already exists. Then, this automatic process is followed by conscious moral reasoning, which, in general, tends to justify the affective reaction.

Nevertheless, this does not mean that moral judgments are static and unchangeable. In the paths of his model, Haidt (2001) has specified three ways in which the conscious moral decision may modify or change the intuitional judgment: (1) conscious moral reasoning, (2) reframing the situation with a new perspective followed by new intuitions, and (3) communication processes with other persons, offering new arguments for the moral judgment in turn followed by new intuitional and reasoning processes.

In summary, although moral intuitions are initially automatic and affective, they can nonetheless be shaped and, furthermore, developed over time, offering a promising route to leadership development.

### Moral Pluralism

Between and within cultures, individuals often have very different beliefs about right and wrong. The MFT represents this pluralistic position to morality. Building on research by Shweder and colleagues (1997), it expands the traditional perspective with a focus on aspects of justice and

care (Kohlberg 1981; Gilligan 1982) and introduces a more differentiated set of moral content domains. So far, the following five moral foundations have been identified (Graham et al. 2013; Graham et al. 2011; Haidt 2012), which are suggested to represent stable cultural and interindividual differences for moral preferences, including different sensitivities for specific domains of morality and the willingness to violate them:

1. Care/harm (i.e., focus on the reduction of suffering and increasing well-being)
2. Fairness/cheating (i.e., focus on a decrease of cheating and an increase of justice, fair, and trustful interactions and reciprocity)
3. Loyalty/betrayal (i.e., focus on a need of coalition building and punitive actions against outgroups)
4. Authority/subversion (i.e., focus on hierarchical relationships)
5. Sanctity/degradation (i.e., focus on purity and cleanliness and an avoidance of contaminants)

It is important to note that the current model is not in a final stage and may be extended. Most notably, recent research provided initial evidence for a sixth foundation referring to conflicting priorities between liberty and oppression (i.e., focus on concerns about autonomy and freedom vs. oppression and dominance). These six foundations are usually divided into two superordinate groups: binding foundations including loyalty/betrayal, authority/subversion, as well as sanctity/degradation and individualizing foundations including care/harm, fairness/cheating, and liberty/oppression (Graham et al. 2009; Iyer et al. 2012).

### MFT and Leadership

Despite the growing interest in moral intuitionism in management research, attempts to specify the potential impact of moral foundations in the leadership process are scarce. Two aspects have spurred particular theoretical interest so far: first, the relationship between leader moral foundations and actual leadership behaviors and second, the

role of (mis)fit between leader and follower moral foundations.

### The Role of Leader Moral Foundations

Recent theoretical research (Weaver et al. 2014; Fehr et al. 2015) proposed that the moral foundations of leaders can be linked to leadership values and prototypical behaviors associated with popular leadership styles. In fact, when leaders differ in their sensitivity for certain aspects of morality and the willingness to violate them, they may adopt a different explicit and implicit understanding of leadership and thus prefer (and avoid) specific forms of leadership behaviors. For instance, a manager with a strong care orientation and less concern for authority would be more able to forgive subordinates when confronted with offenses, conflicts, or mistakes. In a similar vein, a middle manager with a strong preference for loyalty over care or fairness values would be less inclined to expose follower or corporate wrongdoing.

Connecting the MFT to certain leadership models, the care/harm moral foundation is akin to genuine people-oriented leadership such as the individualized consideration component of transformational leadership and servant leadership. The fairness moral foundation parallels the balanced processing component of authentic leadership as well as rewarding and transactional leadership. The sanctity/degradation moral foundation is reflected in spiritual leadership, whereas the loyalty/betrayal moral foundation relates to the inspirational motivation component of transformational leadership as well as self-sacrificial leadership. Finally, whereas the authority/subversion moral foundation refers to directive and authoritarian leadership, the liberty/oppression moral foundation is related to empowering leadership.

### The Role of (Mis)fit Between Leader and Follower Moral Foundations

MFT has been used to explain why and how followers come to view their leaders as ethical (Fehr et al. 2015). It is proposed that followers perceive their leaders as ethical when the leader behavior is consistent with their own moral

foundations or the moral foundations endorsed by the organizational culture. This process is referred as to “moralization” (Fehr et al. 2015). For example, a leader with a strong authority orientation would be less likely perceived as ethical by followers who predominantly endorse care and fairness values in their moral judgments.

Notably, according to this notion, also the culture of an organization can be described in terms of moral foundations, including considerable variations across different organizations. Even if followers and organizations’ moral foundations are not aligned, followers understand what behaviors are regarded as ethically correct in a given organization. For instance, humanitarian and development organizations are usually focusing on care and compassion as basic moral values, whereas in military organizations, the focus is more on loyalty and authority. A leader with a strong care orientation would likely not be perceived as ethical in an organization culture built on values of authority.

Building on this, it is argued that moralization motivates followers to engage in value-consistent behaviors in two ways. First, it is theorized that acting in line with leaders’ moralized behaviors helps followers to maintain positive self-regard, because individuals generally seek to act in accordance with standards they regard as relevant and desirable. Second, leaders’ moralized behaviors promote social learning enabling followers to understand what it means to maintain a moral reputation within an organization.

Within this framework, an important assumption is that the specific behaviors moralization encourages depend on what ethical content is moralized. Followers are motivated to behave prosocially (i.e., helping others within or beyond the organization) when they moralize leader behavior that is consistent with the care/harm and the fairness/cheating foundation. When followers moralize leader behavior referring to the loyalty/betrayal and sanctity/degradation foundations, they will be motivated to engage in pro-organizational behavior (i.e., promoting the organization’s interests). Proleader behavior (i.e., promoting the leader’s interests) results from the moralization of

leader behavior relating to the authority/subversion moral foundation. Finally, when the moralization process refers to leader behaviors that are consistent with the liberty/oppression moral foundation, followers will be motivated to show pro-individual behaviors (i.e., promoting the autonomy of others).

## Conclusion

The MFT has been established as a powerful theory to explain the development of and variation in human morality. As such, it has important implications for leadership. It is plausible that specific leader behaviors represent a function of leaders' moral foundations. Moreover, the (mis)fit between leader's and followers' moral foundations may influence followers' ethical leader perceptions and, eventually, their behaviors. The consideration of moral diversity and the interaction of different moral foundations within and between leaders and followers promote a more differentiated understanding of the relation between ethics and leadership. Finally, as the inclusion of MFT into leadership research continues to mature, current research is also increasingly focusing on the plasticity of moral foundations, which is highly relevant for ethics training and education.

## Leadership Motives or Intentions

Barbara Steinmann

Bielefeld University, Bielefeld, North Rhine-Westphalia, Germany

### Synonyms

Implicit motives; Implicit needs for power, affiliation, and achievement; Recurrent concerns

### Definition

Implicit motives are an inner striving for certain types of incentives a person perceives as pleasurable. They orient, select, and energize actions and are thus among the major determinants of human conduct (McClelland 1985). In driving a person's behavior, three classes of implicit motives have come to be seen as primary: the need for power, the need for affiliation, and the need for achievement (Bernecker and Job 2011).

### Description

#### Implicit Motives

Implicit motives evolve early during a person's childhood. Therefore, they are non-linguistically represented and consciously inaccessible (McClelland and Pilon 1983). Yet, they determine how one feels and behaves (Fodor 2010). Implicit motives are related to spontaneously occurring life outcomes such as a person's career success as well as to long-term behavioral trends (McClelland et al. 1989). Dependent on whether a person's behavior is predominantly motivated by the need for power, by the need for affiliation, or by the need for achievement, these behavioral trends vary and so do the incentives one seeks pleasure from: People motivated by the need for power seek pleasure from exerting an impact on others or the world at large. Therefore, they strive to regulate, control, or persuade other people

(Winter 1994). Those motivated by the need for affiliation seek to establish, maintain, and restore harmonious relationships with those around them (Heyns et al. 1958). They are concerned with affiliative and companionate activities and feel sadness in situations of separation (Winter 1994). People motivated by a highly developed need for achievement seek pleasure from working on challenging tasks, strive for exceptional accomplishments, and compete with a standard of excellence (Winter 1994). Commonly, people are motivated by more than one motive at a time (cf. McClelland 1992) and each motive may find expression in a variety of behaviors (Schultheiss and Schultheiss 2014). Even though implicit motives relate to certain types of behavior, their behavioral manifestation is not straightforward. On the one hand, it depends on the interplay of those motives making up a person's particular motive disposition (Steinmann et al. 2016). On the other hand, it is modulated by the degree of activity inhibition inherent in a person, a stable tendency that refines and inhibits one's motivational impulses (McClelland 1979).

#### Implicit Motives and Unethical Leadership Conduct

The value of implicit motives to leadership performance and effectiveness in political as well as corporate realms has widely been acknowledged theoretically as well as empirically (Winter 2010). Although scholars mainly concentrated on the role of the need for power, the needs for affiliation and achievement have also been considered in the context of leadership and have been related to different instances of unethical conduct of leaders.

##### The Need for Power

The need for power is of special importance to success in leadership positions as it inherently drives leaders to seek pleasure from exerting an impact on others (McClelland 1985) and keeps the individual's interest in leading on the long-run (House and Aditya 1997). If highly power-motivated leaders are equally high in activity inhibition, they use their power in socially intelligent ways and for the benefit of others or the welfare of the organization they are part of (Winter 1973).

Such leaders are characterized by a socialized power motive. If, by contrast, the ability to inhibit motivational impulses is hardly developed in leaders, they use their power self-servingly and to aggrandize themselves. They show a personalized use of power (McClelland and Wilsnack 1972). People high in such an unconstrained display of power favor antisocial decisions in situations of conflict (Magee and Langner 2008) and try to maximize their personal gains (Terhune 1968). Being in leadership positions, personalized power-motivated people coerce followers to foster their promotion and to increase their own benefits irrespective of the costs resulting for these subordinates or the entire organization (McClelland 1985). Often, such leaders even use their power to the detriment of others (House and Aditya 1997). Having an excessive, nonrestricted power motivation, leaders become superior, impatient, outspoken, as well as dictatorial and show aggressive, antisocial, and (morally) reprehensible conduct (Winter 1973, 2000). Given these attributes and behaviors, a personalized use of power has been considered an important motivational antecedent of unethical and destructive leadership behaviors (House and Aditya 1997; Howell and Avolio 1992; Padilla et al. 2007).

#### The Need for Affiliation

The need for affiliation has been said to impede effective leadership (McClelland 1975) as leaders characterized by this implicit motive are overly concerned with being liked by followers (McClelland and Boyatzis 1982). Given their drive to keep their subordinates' affection, such leaders try to satisfy their followers' individual needs. These attempts often lead to particularistic judgments which other team members perceive as unfair (McClelland 1985). In order to maintain harmonious relationships with those around them, affiliation-motivated leaders further base managerial decisions on liking instead of organizational necessities and are thus prone to practice favoritism (House et al. 1991). Accordingly, the need for affiliation has been related to corruption in political and bureaucratic organizations (Spangler et al. 2014). Fairness and integrity, however, are core components of ethical leadership (Kalshoven et al. 2011) and essential in being

perceived as ethical leader. In addition, research on the need for inclusion – a need closely resembling the need for affiliation – showed that people high in this concern tend to engage in more unethical behavior directed at the good of their team if they face the risk of being excluded from that group (Thau et al. 2015). Unethical behaviors which ensure better outcomes for one's team may hence help leaders to improve their inclusionary status within their work group (Thau et al. 2015) and to preserve positive relationships with their subordinates. As it satisfies their dominant need, affiliation-motivated leaders are therefore at risk to engage in pro-group unethical behaviors. As such, unethical conduct of leaders may not only result from selfish or assertive intents energized by a personalized power motive but may equally serve the purpose of maintaining one's belongingness to a social group.

#### The Need for Achievement

People high in the need for achievement are concerned with doing things personally. Therefore, this need has been assumed to be particularly relevant for leadership success in small-scale businesses, sales, or entrepreneurial positions rather than in middle or upper management (McClelland 1977). In such jobs, leaders may not only do most of the work themselves (McClelland and Boyatzis 1982). These jobs also satisfy the achievement-motivated person's interest in taking moderate risks and in doing things differently or improving them (McClelland 1985). Leaders high in the need for achievement are reluctant to delegate responsibilities (House and Aditya 1997), avoid to take decisions, and do not enforce authority (Spangler et al. 2014). Given that they are concerned with winning and successfully competing with others, they are in danger of behaving unethically as a competitive orientation potentially influences one's ethical conduct in various realms of life (Ryska 2002). Accordingly, to attain the goals they strive for, achievement-motivated people are inclined to cheat (Johnson 1981) and those high in hypercompetitiveness – a personality trait closely associated with the need for achievement which aligns one's behavior to winning – favorably judge immoral actions if these actions maximize their own gains at the

expense of others (Mudrack et al. 2012). When they are in leadership positions, those characterized by a highly developed achievement motive tend to ignore political or interpersonal issues in order to complete the tasks they are working on and to reach the unique accomplishments they long for if their unconscious motivational striving is not modulated by high levels of activity inhibition (Spangler et al. 2014). Hence, if ends matter more than means, an excessive achievement motivation may induce unethical conduct of leaders.

## In Conclusion

For different reasons, the motivational Big Three, the need for power, the need for affiliation, and the need for achievement, may energize unethical (leadership) behavior. Whereas the relation among a personalized display of power and unethical leadership is closest and the one most regarded in theory and research, high levels of the needs for affiliation and achievement may equally drive leaders to show behaviors which are normatively not appropriate. Especially if the expression of implicit motives is not refined by a high degree of activity inhibition, people in leadership positions are at risk of engaging in unethical behaviors. As such, the tendency to restrain and modulate motivational impulses seems to be an important personality facet in preventing unethical conduct of leaders.

## Leadership Theory

Karianne Kalshoven<sup>1</sup> and Paul G. W. Jansen<sup>2</sup>

<sup>1</sup>Amsterdam Center for Integrity and Leadership, Amsterdam, The Netherlands

<sup>2</sup>Department of Management and Organization, Faculty of Economics and Business Administration, VU University, Amsterdam, The Netherlands

### Synonyms

Charismatic leadership; Ethical leadership; Transformational leadership; Unethical leadership

### Definition

Leadership theory focuses mainly on perceptions of followers' judgment of leadership behaviors. Perceptions of leadership behaviors are highly valuable, although it is not clear which behavioral criterion is applied in employee's perceptions. There are several criteria that can be used to assess the effectiveness or adequacy of the behavior, for instance, aiming for effective and efficient goal-realization (strategic behaviors); truth and correctness (constative behaviors); sincerity, authenticity, and truthfulness (expressive behaviors); rightness and morality (normative behaviors); and personal change and transformation (inspirational behaviors). Thus, for instance, acting morally means applying rightness and morality criteria for evaluating behavior rather than strategic, constative, expressive, or inspirational criteria.

### Description

To maximize perceptions of ethical leadership, one should be clear about what one means by *ethics* in ethical leadership. This presupposes however that leaders are able to construe different behavioral criteria and manage others in line with these. For instance, an issue might be defined in

line with a moral criterion and/or an efficiency criterion. That is, aiming for effectiveness and goal-realization (strategic behaviors) or aiming for morality and justice (normative behaviors). A clear example is that public opinion considers larger bonus unethical – so an ethical problem – while top-level managers argue these on account of efficiency. Another example of ethical leadership behavior “*sets an example of how to do things the right way in terms of ethics*” (Brown et al. 2005), it may be asked why this is an example of particularly *ethical* leadership behavior? and how this is different from other types of leadership?

Habermas (1984, p. 329), building on the work of Austin (1975) and Searle (1975) on speech acts, distinguished five general types of “communicative behaviors.” In a speech act, we do something by saying something, as when issuing an order (Bach and Harnish 1979). Speech acts are commonly taken to include such acts as ordering, promising, or changing/transforming. Since through a speech act, a person performs an act

by the very activity of speaking, speech acts are part of communicative behavior. Habermas applied the concept of speech acts to communication behaviors in general. Communicative behavior refers to more than only speaking, for instance, ideas and norms can also be communicated by writing or by setting behavioral examples. Examples of Habermas’ five types of communicative behaviors and related “speech” acts are: “I tell you to...”; “I advise you...”; “I confess to you...”; “By this I confirm...”; or “I change you into...” (see Table 1). The five communicative behaviors correspond to five *behavioral criteria*: aiming for effectiveness and goal-realization (strategic behaviors); aiming for truth and correctness (constative behaviors); aiming for sincerity, authenticity, and truthfulness (expressive behaviors); aiming for rightness or morality (normative behaviors); or aiming for personal growth, development, and change (inspirational behaviors). The fact that people can mix up *behavioral criteria* by reacting emotionally to factual (constative) behavior serves to illustrate the usefulness of these distinctions (Haidt 2001). Thus,

**Leadership Theory, Table 1** Overview of illocutionary speech acts, behavioral criteria, communicative behaviors, as well as links with leadership types

| Illocutionary speech act              | Behavioral criterion                      | Communicative behavior | Type of leadership | Example items                                                                                           |
|---------------------------------------|-------------------------------------------|------------------------|--------------------|---------------------------------------------------------------------------------------------------------|
| Directive<br>( <i>I order...</i> )    | Effectiveness and goal-realization        | Strategic              | Transactional      | ... gives me special recognition when my work is very good <sup>a</sup>                                 |

following Habermas, classifying behaviors as *ethical* requires the application of a moral behavioral criterion (Treviño et al. 2006).

### Applying Behavioral Criteria to Distinguish Leadership Types

Classifying behaviors as *ethical* requires the application of a moral norm (Treviño et al. 2006). That is, behaviors are ethical leadership behavior when an ethical behavioral criterion is applied in employee's perceptions: *what counts is the criterion, not the behavior*. For instance, the ethical leadership behavior, [my manager] *sets an example of how to do things the right way in terms of ethics* (Brown et al. 2005), may be classified following the classification of communicative behaviors in Table 1, as an instance of strategic, of constative, of expressive, of moral, or of inspirational behavior depending on the criterion that is applied:

- Strategic: setting an example of ethical behavior may help achieve goals. Since setting an example of ethical behavior is not the same as *being* ethical, it could be an instance of strategic, purposeful communication. The manager is a strategist.
- Constative: setting an example of ethical behavior may help reach the truth. The manager may, through showing ethical behavior, help to uncover the facts in a work situation.
- Expressive: setting an example of ethical behavior may be truthful in the sense that there is no gap between what the manager does in the outer-world and what is felt or thought within the innerworld. Managers do what they mean or feel.
- Normative: setting an example of ethical behavior may be a demonstration of the correct behavior if it complies with an applicable moral norm. Here, the manager behaves ethically.
- Inspirational: setting an example of ethical behavior may inspire employees to do likewise and in that way be an intervention for personal transformation. In such cases, the manager is a change agent.

This example shows that this ethical leadership behavior, [my manager] *sets an example of how to do things the right way in terms of ethics*, will remain ambiguous with respect to which type of leadership it represents, as long as the criterion is not specified. Acting morally means applying a moral behavioral criterion rather than a strategic, constative, expressive, or inspirational behavioral criterion. In the specific case of ethical leadership, the moral behavioral criterion refers to both demonstrating ethical leader behavior and stimulating ethical employee behaviors. Moral awareness is essential, so that one can recognize that different behavioral criteria exist and that morality as a criterion is important in working life (Treviño et al. 2006). Deliberately neglecting the existence of distinct behavioral criteria, or enforcing, for instance, a strategic behavioral criterion as the dominant managerial criterion, amounts to “moral disengagement.”

Whereas in current research ethical leadership refers to a leader behaving ethically or stimulating employees to behave ethically, in our approach based on the Habermas framework ethical leadership means *stimulating or ensuring, through proper communicative actions, that specific behavior (such as being earnest) is assessed or valued according to a moral criterion rather than, for instance, to a strategic or expressive criterion*. Again, the leader may apply a moral criterion him/herself or stimulate employees to frame or conceive the situation using rightness and morality criteria. The distinction between applying an ethical criterion or exhibiting ethical behavior has the advantage that whereas framing a situation as ethical can be measured, however evaluating actual ethical leader behavior poses problems since this presupposes that such behavior and therefore the specific situation has already been assessed using application of a morality criterion.

As stated earlier, ethical leadership in the sense of applying a morality behavioral criterion instead of effectiveness or correctness may be denoted as moral awareness. So in our view, ethical leadership involves stimulating moral awareness among followers (Treviño et al. 2003). For instance, in a group discussion about top manager bonuses, the

manager would stimulate thinking about what types of arguments or behavioral criteria are allowed, or are applicable, or actually used, in a discussion. Are that arguments of effectiveness (e.g., in solving an agency problem), and/or of sincerity (e.g., openness or transparency), and/or of morality (e.g., justice)—so, business rationality or societal responsibility? Another example is the appropriate criterion in reacting to an employee's complaint. Should one take the employee to court, or admit the truth? In such discussions about behavioral criteria, the most interesting responses are those that are ambiguous. Admitting the truth and taking the blame can be argued for on the grounds of good publicity (a strategic criterion), or the employee being right (a truth criterion), or justice (a moral criterion).

### **Ethical Leadership: Managing Conflicts Between Different Behavioral Criteria**

In a society where communities meet and have to work and live together, people have to get along together in their moral behaviors but without completely given up their ethical principles. This requires at least being able to communicate about your own and others' moral norms in order to reach some sort of workable agreement (Habermas 1984).

In such situations, there may well be conflicts between different behavioral criteria. Take for example the statement: *"I will do everything to save my organization."* This can be the basis for a conflict between different:

1. Behavioral criteria: for instance, arguing about large bonuses on the criterion of effectiveness and goal-realization using agency and labor market reasons or on the criterion of morality and fairness using reasons of social justice.
2. Instances of various normative behavioral criteria, that is, between different ethical principles: for instance, all human beings are equal ↔ you should take care of your own employees particularly within the organization (see e.g., Eisenbeiss 2012).

To explain the second point on basis of various distinct normative criteria, behavior can be

denoted as ethical, for instance, because it is instrumental in achieving a valued result for the greatest number of people, or because it complies with a general moral principle, or because it agrees with what is considered a virtue in the current situation. However, in a Habermasian perspective, ethical leadership involves influencing the behavioral criterion that is applied in a given situation and focusing specifically on an ethical norm by communicating about ethical norms in an open "power-free way" (Habermas 1984). For instance, in a group discussion about different criteria of morality, the latter would have to include (a) explaining the criteria of morality that are in use and (b) discussing the effects of these different ethical criteria on the assessment of the rightness of specific behaviors.

### **Conclusion**

Ethical leadership means explicating different behavioral criteria and influencing employees in the appropriate, obviously situationally contingent use of a moral criterion. By doing so, these leaders ensure that employees both know and understand which concrete behaviors belong to a given norm. We have distinguished ethical behaviors as behaviors where a behavioral criterion of morality /rightfulness applies, from strategic (effectiveness/goal realization criterion), constative (truth/correctness criterion), expressive (sincerity/authenticity criterion), and inspirational (growth and development criterion) behaviors. Since this list of speech acts is not exhaustive, more leadership types are possible.

Since the debate on ethical norms can never be closed, ethical leadership will forever be a dynamic, open construct, and other conceptualization of ethical leadership remain well possible (e.g., Eisenbeiss 2012). Communicative behavior refers to more than only speaking, for instance, ideas and norms can also be communicated by writing, or by setting behavioral examples. Therefore, leaders could be trained in these communicative behaviors. Important concepts in conversations about ethical norms are, for instance, framing/sensemaking, background narratives, moral imagination/reflective equilibrium, and the role of disagreement.

Affirmative action; Compensation equity; Diversity; Diversity audit; Diversity education and training; Inclusion; Performance appraisal; Professional development; Recruitment and retention

## Introduction

While the concept of diversity, as an issue for US businesses to focus on, really only gained traction in the late 1980s, in the past two decades, the realization that there is a strong connection between diversity and having a competitive business advantage has increased as businesses have expanded their activities into the global marketplace. Workplace diversity acknowledges the reality that people differ in many ways, visible or invisible, including races, ethnicities, genders, ages, religions, disabilities, and sexual orientations, and these same people may also have differences in education, personality, skill sets, experiences, and knowledge bases that all need to be understood, accepted, and valued (Shen et al. 2009). It is no surprise then, that the increase in internationalization and globalization of businesses has exacerbated the importance of workplace diversity. Diversity itself, however, is neither meaningful nor beneficial if it does include the creation of an environment of inclusion. Inclusion means going beyond compliance-based, minimum requirements-

set-forth-by-law prerequisites to create a place of business that actually harnesses and maximizes the talent of the company's greatest asset: its people (Danna 2017). One study found that companies more often gave more weight to diversity than inclusion when it has been shown that diversity plus inclusion is what leads to improved business performance (Deloitte 2013). As such, diversity and inclusion together are essential components of a healthy and successful organizational culture. In fact, this same study found that when employees think that their company is highly committed to, and supportive of diversity, *and* they feel highly included, then they are 80% more likely to agree that they work in a high-performing company (Deloitte 2013).

One of the more critical aspects of a Human Resource professional's job is to create and cultivate an environment supportive of the different experiences and perspectives among their particular organization's workforce to ensure that it attracts and retains talent, which is one of the many ways a business can remain competitive in the marketplace. Moreover, effective HR professionals must develop strategies that focus on improving the organization's flexibility and knowledge base to foster and cultivate a work environment that is conducive to diversity and inclusion management. After all, diversity and inclusion management are not just a part of what human resources managers do, they should be critical components of their company's practices and policies. A workplace that supports diversity and inclusion attracts top talent because talented people naturally gravitate toward organizations that embrace diversity in such a way that it can yield meaningful career paths for these engaged and motivated employees.

Diversity and inclusion are no longer simply compliance-based, meeting the minimum requirements of the Equal Employment Opportunity Commission (EEOC) or Affirmative Action (AA) expectations; rather, they are now considered important aspects of successful businesses. They are also the result of what science tells are peoples' deep-seated needs to belong and to be noticed and appreciated.

## Diversity and Inclusion Management

Managing diversity refers to a proactive approach intended to manage a heterogeneous workforce in such a way that potential advantages of diversity are maximized, while its potential disadvantages are minimized (Kundo 2015). That means, enabling a diverse workforce to perform to its full potential in an equitable work environment where their individual differences are deeply valued to build a more effective and profitable organization (Kundo 2015). Inclusion can be described as an active process of change or integration, as well an outcome, such as a feeling of belonging. Inclusion means that the employees feel that they work in a place of fairness, respect, value, and belonging and that their unique value is known and appreciated (Deloitte 2013).

In the past, the efforts to diversify a workforce were driven by a need or desire to insulate a company against claims of discrimination. Concepts of Equal Employment Opportunity (EEO) and Affirmative Action (AA) were largely born out of the civil rights movement of the 1960s (Shen et al. 2009). The modern, twenty-first century concept of diversity management and inclusion is a departure from the negative connotation of the past, rather, it is focused on the positive attributes that accompany a diverse and inclusive workplace. In a nutshell, diversity management "takes advantage of the growing cultural pluralism that results from the internationalization of business, development of world markets, growing workforce mobility, and the increasing awareness of individual differences" (Shen et al. 2009).

## Objectives and Practices of Diversity Management and Inclusion

While one of the obvious objectives of human resources diversity management is to be compliant with EEO and AA requirements, human resources managers also need to realize that additional objectives include assembling a workforce/workplace that is creative, flexible, attractive to future employees, and aides in retaining the

current workforce. In order to achieve these objectives, human resources managers need to incorporate the mindset of diversity and inclusion into every aspect of their role as people managers. They need to develop a culture that unifies diverse employees under a common value set which will, in turn, help the company embrace diversity as a tool for augmenting organizational effectiveness and performance (Kundo 2015). Because the effects of diversity can be positive, negative, or neutral, depending on how well it is managed, as well as if the environment is one of inclusion, it is imperative that a company's diversity management strategy address organizational cultural change to insure that diversity is both valued and encouraged (Kundo 2015). Achieving a diverse and inclusive workplace is not something that can be achieved overnight or without significant effort. In the constantly changing and evolving landscape of business, it can be difficult to find new ways to connect diversity and inclusion to business value and, in turn, shape a workplace culture that thrives even in the most unpredictable business climates.

### **Building a Foundation of Diversity and Inclusion**

HR professionals should lead the charge to create a business environment that fosters inclusion. Unfortunately, when it comes to issues of diversity and inclusion, most organizations tend to take knee-jerk or "band-aid" type actions without incorporating both into the foundation and culture of the business itself. Some of the barriers that HR professionals must overcome when taking a leadership role in implementing systematic and comprehensive diversity and inclusion education programs are: (1) too many educational programs are stand-alone or piecemeal programs that lack a connection to a cohesive organizational diversity management framework; (2) the absence of an auditing or process for measuring the acquisition and application of learning to the workplace; (3) lack of diversity in the facilitators of the diversity education programs; and (4) failure to include all levels of employees in the diversity development process (Chun and Evans 2018).

Inclusion can only be successful if it starts with building a solid business culture foundation that supports its goals and objectives. That means that businesses first need to define what kind of culture they would like to exist in their workplace. While this is often accomplished from a top-down perspective (senior management dictating to the masses), it is essential to realize that many of the most effective ideas for inclusion can come from below. Next, the business needs to self-assess the existing cultural strengths and weaknesses with the organization. This will also help identify assets that already exists that can support and reinforce the diversity and inclusion mission as well as identify areas that need improvement. After that, the organization can reach out and form focus or identity groups to bring people together to solicit ideas. This would be followed up by collecting those ideas, along with any data that is mined in the process, and then develop strategies, policies, and education programs to implement whatever ideas the organization feels best support its diversity and inclusion mission. In a nutshell, HR managers should be the researchers that gather the data needed to develop the most effective diversity and inclusion initiatives and they can also act as the advocates for the program since they have the ability to communicate across the different departments and focus groups. HR managers, in effect, are both facilitators and influencers, all the while aware of the various political nuances that exist within a particular business to help protect and nurture the diversity programs, support all of the various participants, and to think strategically while being mindful of the long-term and short-term goals to support the diversity and inclusion mission (Gutmacher 1998).

### **HR's Role in Diversity Management and Inclusion**

Diversity management and inclusion are not separate activities that HR professionals engage in; rather, they are integrated into the various practices and policies of the core functions of their practice: recruiting talent, performance management, benefits, pay issues, education, and

development. Throughout an employee's lifecycle, there exists critical points where the employee is more vulnerable to decision-making bias or behaviors that can unconsciously create an advantage for some and a disadvantage for others that undermine aspirations of diversity and inclusion (Deloitte 2013). Diversity management and inclusion should be integrated not only into these vulnerable moments, but into the fabric of equality of opportunity, flexible working hours, work-family balance, meaningful and participative performance assessment, and inter-cultural education (Kundo 2015). In the end, all businesses would prefer to recruit, retain, reward, and promote a heterogeneous mix of talented employees. Moreover, employees would prefer to work for a company where promotion and development opportunities were based on merit, recruitment processes supported the selection of the best person for the job, and performance management/appraisal processes enabled employees to demonstrate their particular and unique skill set (Deloitte 2013).

### **Diversity as Part of Recruitment**

Many companies have been successful in hiring a more diverse workforce that includes women, minorities, disabled persons, and other socially disadvantaged persons in a way that resembles the more diverse environment within which they are situated. To support an effective policy of diversity and inclusion HR managers need to help managers make hiring and promotion decisions based on diversity sensitive criteria. That includes having visible diversity in hiring committees as well as hiring and promotional decisions based on specific job-related qualifications, competencies, and experience (Kundo 2015). In order to attract a diverse array of candidates, HR managers need to also ensure that the company has a work-life balance and benefits package that has flexibility built-in and considers the diverse needs of today's workers. Benefits such as flexible work schedules, work from home, child-care options, parenting leave, and an array of other work-life balance issues all need to be a regular part of how the company does business. This supports the concept of inclusion; that is, that

these benefits are not available to select employees/managers or are even in existence to solely to satisfy a legal requirement, rather, they are part of the culture of the organization and are available to all employees.

### **Education and Development**

It is important to distinguish between the term "education" and "training." People are educated while animals are trained. While this may seem like semantics, it is important to stress that the language and terminology used in this area are critical because unfortunately, most diversity education programs used by businesses employ language that has the negative and unintended impact of reinforcing existing norms, values and perspectives of the dominant segment of the organization. Initially, US companies developed "diversity training courses" that could last from an hour to more than a day as a way of wiping out biases against women and minorities in the workplace (Lipman 2018). In the past, diversity education sessions were treated like all other information disseminating exercises; that is, they were one-time events or something that was rolled out after a violation was experienced. To be effective, diversity and inclusion education needs to be a systematic process where the entire workforce – top management down to the lowest-ranked employees – is educated about the cultural, socio-economic, racial, identity, and religious differences among employees (Kundo 2015). Recently, studies have found that, in many instances, diversity training has actually had the unintended consequence of making things worse in the workplace because many of the participants have interpreted the key learning point as having to walk on eggshells around women and minorities and having to choose their words carefully so as not to offend (Lipman 2018). In some instances, women and minorities leave the training with a belief that their coworkers are even more biased than originally believed and that learning about others' biases can actually heighten one's own (Lipman 2018). Because so many companies improperly handle the issue of diversity education, many employees claim to suffer from "diversity fatigue" (Lipman 2018).

When diversity education is made mandatory, focuses primarily on the legal aspects of discrimination, and is specific to only certain categories of employees (i.e., managers), then it is most likely going to be unsuccessful. Rather, when diversity and inclusion education focus on perception and awareness, including everyone at all levels of the organization, and recognizes that everyone can engage in unconscious biases, it has a higher likelihood of success.

### **Performance Assessment**

Discrimination in performance appraisal is one of the root causes of job dissatisfaction and demotivation for a diverse workforce and, as a result, women and minorities often feel neglected and do not believe they have an upward career path (Kundo 2015). Because of this, women and minorities often do not feel like valued employees and, instead, feel like they are “diversity props” or tokens of diversity without actual inclusion (Jackson 2019). It is part of an HR managers’ responsibility to create an environment where all employees feel valued and included. It is incumbent on HR managers to make sure that a company’s performance appraisal practices are objective and not subjective, that they are directly related to the job and company and are fair to all employees while avoiding special treatment. As part of diversity management, HR managers should review performance appraisal processes to excise any language or consideration of the employee’s race, gender, or other diversity characteristics. In addition, one of the reasons that many diverse workers feel that their upward trajectory has been stunted is because of a lack of effective mentoring. It is imperative that HR managers examine both formal and informal mentoring arrangements and identify situations where a successful senior member of the workforce can be paired with an underrepresented junior employee with the objective of guiding them and to help remove any invisible barriers that may impede the advance of their career.

### **Compensation and Flexible Schedules**

Pay equality is part of effective diversity management. Compensation structure, wage determinants, and benefits schemes should be designed

around objective factors relating to the individual and position at issue and should be free from discriminatory factors. It should not be a surprise that a diverse workforce will have different priorities when it comes to their families and their work–life balance. As such, an individual-driven compensation system can support individual lifestyles and will further promote diversity (Shen et al. 2009). It is not uncommon for big companies to adopt an array of policies/benefits relating to work schedule flexibility to accommodate varying lifestyle needs such as: day care, work from home needs, flex schedules, and even accounting for employee’s desires to use time for charitable or health related endeavors. Not every employee has the same family situation or expectations and HR managers, as part of their diversity management efforts, need to make sure that the company is open to supporting these diverse needs and expectations.

### **Workplace Environment**

HR managers are also charged with making sure that the day-to-day work environment is one that embraces diversity and provides for inclusion. That means also being mindful and aware of the changing landscape of diversity. The most recent change to the area of diversity in the workplace is the subject of identity. Gender identity and transgender issues have become the focus of considerable attention in recent years, as both famous and ordinary people have shared their experiences and stories. Greater public awareness has followed. Even so, many employers find themselves unsure of how to navigate the shifting landscape (Hayes 2017). HR Managers can start by making sure that gender identity is included in all of the company’s discrimination policies, dress code policies, and any other policy that may create a feeling of exclusion or discrimination, as well as be prepared to respond and provide guidance to all employees should the issue of a transitioning employee arise. Ensure that the workplace is one that insists on civility and respect, which includes making sure that proper use of pronouns is enforced and that employees feel that their identity requests are being honored in all aspects of their employment. Workplace civility and respect are not limited to gender identity, rather the same policies need to be

reviewed and modified, if necessary, to cover issues of race, disability, sexual orientation, national origin, traditional gender issues, and all other areas of diversity present in the workplace.

### **Auditing Effectiveness**

A diversity audit can help eliminate hidden biases, overcome conscious and unconscious unfairness and remove glass (or other) ceilings that may contribute to the decline in worker satisfaction and prevent the creation of an atmosphere that does not support inclusion. In addition, once the above strategies and policies are put in place it is important for the HR manager to audit their success. This is one of the biggest failures on the part of most companies. Companies are quick to recognize the need to adopt a strategy to address diversity and inclusion issues but most fail in the follow-through or neglect to circle back and measure the effectiveness of those strategies. This should be a box-checking scheme that looks solely at data and outcomes; rather it must be an interactive and inclusive process that requires engaging with all members of the workforce to ensure that the diversity management and inclusion policies are effective and working. Periodic audits of diversity and inclusion are necessary to identify the areas that require improvement, as well as companies can use this data to benchmark their position in the industry or region.

### **Conclusion**

Even today, among an array of global organizations that promote the diversity of their workforce, inclusion is not achieved. While most, if not all, companies are aware and conscious of equal opportunity issues, largely because of the legal jeopardy associated with noncompliance, very few go beyond the minimal requirements of the law and still suffer from different internal perceptions of what diversity management means and requires. It is true that successfully managed diversity will lead to a competitive business advantage, particularly in areas such as problem-solving, global understanding,

creativity, innovation, and flexibility (Kundo 2015). Properly managing diversity and inclusion helps enable companies to reduce the costs associated with employee absences, high turnover, legal expenses, and decreased productivity. That is because companies that respect and value diversity and inclusion are able to attract and retain the best employees in their field. Effective diversity management and inclusion can only be achieved when they are valued by all levels of management there is a culture within the organization that supports diversity and inclusion initiatives. HR managers play an important role here and can be the catalyst to help define an organization's approach to these issues, which, in the end, will positively impact individual, team, and organizational performance.

Some scholars have suggested that HR managers can take the lead on these issues by: (1) working to develop an organizational diversity learning plan that includes areas of weakness, outcomes assessment (i.e., audits) and accountability; (2) promoting a data or research driven approach to these initiatives based on the particulars of their specific organization in lieu of using a generic diversity plan; (3) taking the lead in structuring and scheduling educational initiatives, specifically with respect to content and objectives, to make sure diversity and inclusion efforts are coordinated across the entire company; (4) creating an incentive structure that recognizes contributions to diversity and inclusiveness; and (5) examining both conscious and unconscious barriers in the company's hiring, promotion, compensation, and benefits policies and practices to eradicate subjective factors that affect outcomes. (Kundo 2015).

Finally, HR managers need to consider and treat diversity management and inclusion as an ongoing and positive process and not as a problem to be solved. In the end, it doesn't matter how emphatically a company claims it embraces diversity and inclusion if its own policies and practices scream otherwise. With the leadership of HR managers, and the sincere investment of the entire workforce, a company can create a workplace that is simultaneously equitable and free from hostility as well as healthy and competitive.

## Lesser Evil Principle

M. V. Dougherty

Ohio Dominican University, Columbus, OH, USA

## Synonyms

Lesser evilism; Lesser of two evils principle; Principle of the lesser evil

## Introduction

The principle of the lesser evil (PLE), typically rendered in proverbial form as *the lesser of two evils is to be chosen*, has a long history in Western moral, political, and legal philosophy. Among ancient Greek philosophers, Plato, Aristotle, and Epicurus appealed to it, and Cicero popularized the principle for the Roman Latin world. Despite such a noble pedigree, this principle of practical reasoning remains controversial when understood as enjoining an agent to perform an evil act, albeit a lesser one. The numerical restriction to two evils in the typical rendering of the PLE may reflect that difficult choice options often consist of a pair of contradictories ( $A$ ,  $\sim A$ ), where an agent must select between an act and its omission. Other formulations of the PLE, however, envision a wider slate of options and recommend that agents who possess no good alternatives should always choose the *least* evil.

The PLE has received sustained analysis primarily in two contexts by medieval and early modern thinkers: (1) moral dilemma theorizing and (2) counsel for those bent on wrongdoing. In contemporary philosophy, the principle has been examined anew from various points of view.

## Lesser Evil Reasoning and Moral Dilemmas

Despite its lengthy ancestry as a proverb (Singer 2002), the PLE was first subjected to theoretical

scrutiny in the medieval canon law tradition, where canonists considered whether agents could ever be trapped in moral dilemmas. In Distinctions 13–14 of the *Decretum*, the influential twelfth-century textbook of canon law, Gratian considered the PLE as the solution for agents who find themselves inescapably forced to choose between two moral evils. The master of canon law appealed to the authority of Gregory the Great, who had earlier defended the existence of moral dilemmas in his *Moralia*, the influential biblical commentary on the book of Job. Several of Gregory’s examples involved agents who make promises and are thereby caught between the dilemmatic prongs of fulfilling or not fulfilling the promise. Another example involved an agent who uses bribery to acquire a position of authority and then faces the choice of resigning (and thus abandoning those dependent upon his care) or not resigning (and thus retaining the authority unworthily). Appealing to the text of a church council, Gratian proposed that agents in such situations should use “the acuity of pure reason” to determine which of the two options is the lesser moral failure and then choose it accordingly (Gratian 1993: 49). A comparison of moral evils was not an innovation, as moral evils had long been classified into various categories such as major (mortal) and minor (venial), and a select class of especially grave moral failures had traditionally been specified as “deadly” or capital. Still following Gregory, Gratian proposed that when wrongdoing is strictly unavoidable, an agent should minimize it, and by using the PLE the agent will pass to greater virtues. Gratian nevertheless limited the applicability of the PLE to agents who personally find themselves in moral dilemmas; it was not permissible, he argued, to commit a lesser moral evil to prevent someone else from committing a greater one.

Gratian’s defense of the PLE arises out of his consideration of whether the moral law ever admits of exceptions. On his view, a moral evil is never in itself advisable, but when an agent is faced with an inescapable choice between it and a greater moral evil, it becomes recommended as the comparatively lesser moral evil. Gratian’s position was controversial. The authors of the

*Glossa ordinaria*, a multi-authored medieval commentary on the *Decretum*, criticized Gratian severely, arguing that there cannot exist situations where an agent must necessarily commit a moral evil. They argued that agents who believe themselves to be in moral dilemmas are simply foolish or ignorant; a morally permissible way of acting always exists and the commission of moral evils is always avoidable. On this view of the glossators, the PLE is rendered superfluous for practical reasoning in the case of moral dilemmas, since the problem it is meant to solve is only in the mind. The glossators assert that, “In the truth, there is no entanglement” (Gratian 1993: 50). Throughout the later medieval period, Gratian and the glossators became often-cited authorities in continuing debates about the existence of moral dilemmas (Dougherty 2011).

For some medieval philosophers, the PLE was treated as a contrary-to-duty imperative for agents who commit moral wrongs and then find themselves unable (or unwilling) to fulfill all future obligations. On one popular interpretation, a present moral failure may render impossible the fulfillment of a future obligation, and in these cases, the PLE was recommended to minimize wrongdoing.

## Counseling the Lesser Evil

Beginning in the early modern period, the PLE was debated in a related context. Moral theorists examined whether it was permissible to suggest a lesser evil to a malefactor bent on wrongdoing. If a malefactor were irrevocably committed to some form of wrongdoing, would it be licit for a bystander to propose some lesser evil instead? These considerations presupposed that all attempts to persuade the malefactor to desist from the originally intended evil had failed. The counseling bystander in this case would seek to minimize the wrongdoing by providing direction to a lesser, previously unconsidered evil. To one bent on committing murder, for example, perhaps simple assault might be counseled. To another bent on robbery, perhaps drunkenness might be counseled. The debates on this issue focused on

whether such counsel of a lesser evil was permissible, and if so, how restricted the counsel had to be (Flannery 2011). Further considerations inquired whether counseling the lesser evil was simply recommended or outright obligatory.

Among those who defended the permissibility of counseling the lesser evil to a “hell-bent” malefactor, controversies arose (Hannigan 1949). Some argued that the counselor’s proposed lesser evil could differ only in degree from the originally intended evil; on this account, one could only counsel stealing a lesser amount to a thief who had envisioned stealing a greater sum. With this strict view, the counselor could not propose a lesser evil from a different species (e.g., drunkenness instead of theft). Some theorists questioned whether a counselor could suggest that a robber select a rich victim over a poor one, on the understanding that for a rich person to suffer a finite monetary loss is a lesser evil in comparison with the same loss suffered by a poorer person. Advice could be general (“if you must steal, steal from the rich”) or particular (“if you must steal, choose wealthy Richard over poor Robert”). These discussions prompted a consideration of whether a counselor would later owe restitution to a victim if the particular advice given had caused the malefactor to change victims. Among theorists who defended the permissibility of counseling the lesser evil, the major debate concerned whether the newly proposed evil had to be different in degree, or whether it could be different in kind. Even the stricter or less permissive defenders of the PLE had to consider difficult cases. Some theorists questioned whether a vengeful would-be murderer could permissibly be counseled to remove a limb instead, on the grounds that taking of a limb from a victim in an act of revenge was implicitly or virtually contained in the murder, and hence not a moral evil of a different species.

## Twentieth- and Twenty-First-Century Considerations

In more recent times, appeals to the PLE have arisen in a variety of contexts. In the mid-twentieth century, when the topic of moral

dilemmas received renewed interest by Anglo-American philosophers, again the PLE was examined as a possible solution (Donagan 1977: 152). Considerations of the PLE also arise in debates in political philosophy; the principle is often invoked in discussions of voters facing an obligation to cast a ballot from a limited slate of undesirable candidates. Similarly, analyses of the PLE arise in accounts of the so-called problem of “dirty hands,” where political activity is envisioned as requiring some malfeasance on the part of authority to secure a greater social or political good (Shugarman and Rynard 2000). In legal philosophy, the PLE is a key element of the necessity defense for immunity from criminal liability (Alexander 2005). What is normally forbidden by law (e.g., the evil of destroying another’s property) may be exculpable if doing so is necessary to avoid extreme danger or harm on a large scale.

Borrowing from traditional critiques of utilitarianism, some philosophers have criticized the usefulness of PLE by arguing that many evils, like many goods, are incommensurable, and therefore cannot be compared in terms of greater and lesser. One response has been to argue for forms of measurement that could be the foundation for some comparisons of evils (Spielthener 2009).

The PLE also appears in arguments found in contemporary moral theology, particularly in debates concerning proportionalism and the law of graduality. Proportionalism is a controversial approach that originated in Catholic moral theology in the twentieth century as way to justify exceptions to moral norms in certain circumstances (McCormick and Ramsey 1978). It implied a rejection of the traditional view that certain exceptionless moral norms exist. The law of graduality is a practice used in pastoral formation. It encourages those whose lives fall short of perfection in some particular domain to improve gradually; if one cannot (or will not) desist altogether from a particular moral evil, she or he can at least be encouraged to reform gradually (Burggraeve 2014). Proponents of gradualism consider slow reform (i.e., a reduction of the number of moral failures) to be a lesser evil in comparison with no reform at all. Unlike

proportionalism, gradualism is consistent with the view that there are exceptionless moral norms.

While a moral application of the PLE is often controversial, little controversy exists in the context of a nonmoral use of the PLE. If presented with otherwise equal treatments for curing a serious illness, for instance, the one with less harmful side effects should be chosen over the one with more harmful side effects. The evils in this case are the foreseen but unintended side effects. The PLE simply enjoins the minimization of such physical evils.

## Levinasian Ethics in Business

Vincent Blok

Wageningen University, Social Sciences Group,  
Wageningen, The Netherlands

## Synonyms

Responsibility as substitution; Responsibility for the other; Thinking-of-the-other

## Definition

Emmanuel Levinas’ rethinking of ethics in *Totality and Infinity* from 1961 and *Otherwise than Being* from 1974 opens a new perspective on ethics, in which the social relation between moral actors is highlighted. In my face-to-face encounter with another person, I experience the primacy of the other who appeals to me and asks to act and behave ethically. This other is not an object of knowledge but a radical other who is unknowable, and at the same time calls for ethical behavior in response to his or her call.

## The Essentials of Levinasian Ethics

For Levinas, the point of departure of ethical behavior is found in the face-to-face encounter with the singularity of another person. Traditionally, this encounter of another person is characterized by the reduction of his or her otherness to the same and similar. In *Totality and Infinity*, Levinas

argues: “Western philosophy has most often been an ontology: a reduction of the other to the same by interposition of a middle and neutral term that ensures the comprehension of being” (Levinas 1969: 43). This middle term is a general principle, rule, or category in light of which different persons appear *as* the same – for instance, as a workforce, a shareholder, or a stakeholder. In such a general principle, their singularity and situatedness is neglected. Moreover, this middle term is traditionally found in oneself: “The relation with the other is here accomplished only through a third term which I find in myself. The ideal of Socratic truth thus rests on the essential self-sufficiency of the same, its identification in ipseity, its egoism” (Levinas 1969: 44). Because we find this general principle, rule, or category in ourselves, traditional ethics is characterized as ego-logy in which we see the other person like we see ourselves.

Contrary to this ego-logy of a moral subject in traditional ethics, Levinas develops an ethics which is primarily *responsive* to the demand of the other (he spells the other with the capital letter O – Other – in order to indicate the unbridgeable otherness of this other). And contrary to the focus on moral principles, rules, and universal norms in traditional ethics, Levinas develops an ethics which is primarily responsive to the singularity and situatedness of another person, here and now. Ethical responsiveness does not consist in following ethical rules and norms according to Levinas, because “from the start, the other affects us despite ourselves” (Levinas 1998: 129). This means that according to Levinas, we are unconditionally and always responsible for the other “to the point of substitution for the other”, i.e., we are responsible for the other despite ourselves (Levinas 1998: 75). This singularity is not primarily accessible by our rational judgments, but by our bodily sensibility and sensation in proximity to the other. Bodily sensation “breaks up every system” (Levinas 1969: 59) of rational and universal principles in favor of the singularity of the other, and enables us to take unconditional responsibility for the other in our performance of ethical behavior.

Four main characteristics of a Levinasian ethics can therefore be discerned (Levinas 1969, 1974):

1. Ethics is not an ego-logy but responsive to the demand of the other.
2. The ethical orientation is not found in universal rules but constituted in the confrontation with the singularity of this other.
3. The other is not accessible through rational judgment but through our bodily sensitivity in proximity to the other, in which we perform ethical behavior in response to the call or need of the other.
4. The face-to-face encounter with the other enables us to take unconditional responsibility for the other.

## Levinasian Ethics and Business

The radicality of Levinasian ethics poses not only difficulties for scholars who are interested in the applicability of his ideas in practical questions regarding ethics and justice, but especially for scholars who are interested in the application of his thought in the field of business ethics.

Various scholars have pointed at a fundamental tension between Levinas’ concept of ethics and business. While Levinas rejects the primacy of the moral subject, the focus on universal principles like codes of ethics and conditional responsibilities toward the other, corporates *presuppose* such an ego-logy and focus on universality. Business is primarily self-interested while Levinas’ ethics is criticizing the economic rationality of self-interest and argues for an interest in the other (Roberts 2001). The singularity of the face of the other provides a moral impulse, but this moral impulse is neglected and instrumentalized in totalizing bureaucracies and governance structures in business life, such as codes of conduct and ethical codes (Bauman 1989). Roberts for instance argues that business is characterized by a “narcissistic preoccupation with the self” (2001: 109) and Bevan and Corvellec argue that “serving its self-interest with profit” is a corporations “*raison d’être*” (2007: 212). Because corporations cannot

submit themselves to the other, a Levinasian business ethics is impossible according to these authors.

On the contrary, corporations systematize and regulate corporate responsibility by the introduction of corporate governance and codes of ethics, in which the singularity of the other is neglected in favor of universal norms and principles. Because corporate governance neglects the singularity of the other, corporate codes of ethics can be seen as an oxymoron from a Levinasian perspective (Bevan and Corvellec 2007). In their book on business ethics, Jones and colleagues provide good reasons for a rejection of corporate codes from a Levinasian perspective. Corporate bureaucracy enforces rule-following and with this releases the individual from his or her responsibility for the other (Jones et al. 2005). Also Bauman argues that bureaucracy creates a “moral distance” (Bauman 1989; cf. Mansell 2008).

The incompatibility between moral impulse and bureaucratic governance structures leads to a dualistic conception of business ethics, with the corporation on the one side and ethics on the other. Based on this dualism, the possibility of a Levinasian business ethics is rejected (Bevan and Corvellec 2007; Roberts 2001). Bevan and Corvellec for instance argue that a code of Levinasian ethics would be a contradiction in its own terms.

Another argument against a Levinasian business ethics is that ethical responsiveness to the singularity of the other presupposes a bodily sensation in proximity to the other and that only human beings are able to achieve such a proximity to the other, contrary to corporates. Only human beings can submit to the other, and because a corporation is not a human, it cannot take over this role as a “corporate” citizen: “Corporations lack the bodily subjectivity that is the precondition of a Levinasian approach to the Other; only humans can act ethically and because corporations are not humans, it is impossible to speak of corporate ethics, and we can only speak of managerial ethics” (Bevan and Corvellec 2007: 217).

While a corporate business ethics is impossible from a Levinasian perspective, Bevan and

Corvellec argue that individual managers in such corporations can take responsibility for the other. Byers and Rhodes (2007) move beyond this role of individual management and extend it to employees. They take the social relation to the other in organizations as point of departure in their research and identify cultural practices in organizations in which the singularity of each member of the organization – not only managers and business leaders but also employees – is respected. Such a notion of individual responsiveness, contrary to corporate responsiveness, does not imply that ethical responsiveness to the call of the other is more easily achieved by individual managers and business leaders. If one thing can be learned from the application of Levinas’ philosophical insights in the field of business ethics, it is why egoism and self-interest is so self-evident in business life (Demond 2007).

## Toward a Levinasian Business Ethics

In the discussion of corporate versus individual responsiveness, a strict distinction is made between the corporate level with its bureaucracy of ethical rules and regulations, which is rejected from a Levinasian perspective, and an individual level of leaders, managers, and employees who may develop the sensibility to take care of the other without being able to codify this responsibility in a system of corporate rules and regulations. Some scholars are hesitant to remove all regulation and to count on the moral impulse at the individual level of business leaders and managers alone. Mansell for instance argues: “To the extent that a person can be held accountable to others for the ethical content of their actions, the need for rational justification can be seen as an indispensable requirement of their ethical disposition, even if it cannot be its foundation. If rationalisation can be seen as an integral part of ethics, then perhaps it is understandable that corporations attempt to codify their responsibilities in a set of principles” (Mansell 2008: 566). Mansell maintains a strict distinction between rule following and responsibility for the other, but argues that rules can be seen as a codification of a moral

experience which always remain beyond the rules and cannot be found in these rules (Mansell 2008). According to Mansell, corporate governance is embedded in the moral experience of the other. In this respect, corporate rules and individual managers' sympathy for the singularity of the other belong together in corporate ethics.

As a consequence, rules and codes should be applied in a flexible way in order to account for the singularity of the other and we should reflect continuously on the applicability of these rules in a given situation (Mansell 2008: 573). This reflexivity is also necessary because rules and regulations are not only expected to lead to ethical but also to self-interested behavior of individual managers (cf. Weaver and Trevino 1999). In order to prevent a purely symbolic use of codes and regulations (Arya and Salk 2006) through an ethics of self-interest, in which not being ethical but being *seen* as ethical is essential (Robert 2001), flexibility of corporate governance and reflection on its applicability is a necessary condition to combine rules and responsiveness according to Mansell, which is at least consistent with Levinas' ethics. In this way, Mansell can defend the possibility of a Levinasian business ethics.

Another defence of the possibility of a Levinasian business ethics can be found in the rejection of a strict distinction between the corporate level of bureaucratic governance systems and the individual manager or employee level (Ten Bos and Willmott 2001; van de Ven 2005). According to Ten Bos and Willmott, "bureaucracy may actually accommodate and protect some space for the expression of moral impulses, at least to the extent that it outlaws or inhibits practices (e.g., nepotism) that engender greed or fear" (Ten Bos and Willmott 2001: 789). Van de Ven for instance distinguishes between two types of self-interest of companies – pure egoism which should be rejected from a Levinasian perspective and a type of self-interest that acknowledges its dependency on the other and is presupposed in taking responsibility for the other: "... the constructive integration of a CSR strategy requires that it is compatible with the reproduction (self-interest) of the system. If the management of a firm does not acknowledge this, it could risk the continuity of

the firm" (van de Ven 2005). In other words, only if the continuity of the firm is served, it can take corporate social responsibility for the other. When actors were completely open and responsive to the demands of the other without any self-referentiality or ego-logy, there would not be a "self" at all which is open to these demands of the other. As Blok (2014) argues, our efforts to act and behave responsive to the demand of the other will remain imperfect, because of the self-referentiality of the self (self-interest), which is a necessary condition of our responsiveness as well (cf. Aasland 2007). Because of this egoism or self-referentiality as a necessary condition of our responsiveness to the other, all our efforts to be responsive to the demand of the other remain *imperfect*. And it is the imperfection of our effort which can be taken as a call to substitute for the other, i.e., take responsibility for the other despite our own interests in business. According to authors like van de Ven, the self-interest of actors is inescapable and a condition for the responsibility for the other and in this respect, Levinas' ethics can make business leaders sensible for the ethical in the business context.

Notwithstanding the ambition to transcend the dualism between corporate rules and principles on the one hand and the moral impulse on the other, van de Ven, like Mansell, argues that this moral experience lies beyond rules and regulations. In other words, their ambition to transcend this strict distinction is not achieved while the precise relation between the two is not subject of reflection.

Other philosophers tried to reconceptualize the notion of corporate rules and regulations to solve this dualism in favor of a Levinasian business ethics. Mollie Painter-Morland for instance rehabilitates the notion of corporate codes of ethics by focussing on the relational aspects of codes and by stressing that codes of ethics should be part of an ongoing questioning of decisions and practices, i.e., a questioning of its content, its applicability, and its limitations within the business context. With this, the incompleteness and imperfection of corporate codes is stressed (Painter-Morland 2010). Inspired by Levinas, Vincent Blok developed a performative concept of ethical oaths (Blok 2013) and corporate codes (Blok 2017) in

which the incompatibility between moral impulse and corporate rules and regulations are bridged. Four characteristics of a Levinasian concept of business ethics can be distinguished, based on his work:

1. Business ethics concerns corporate actor's self-regulation to act ethically in response to the call of the other.
2. Self-regulation is constituted by firms' responsiveness to the call of the other and by their self-interest or egoism (self-referentiality).
3. Because of the structural possibility that firms serve their own interests, instead of being responsive to the call of the other, the possibility of the imperfection of firms' responsiveness should be acknowledged in business ethics.
4. Because of the structural possibility of the imperfection of firms' responsiveness to the call of the other, the call should be taken as a call to substitute for the other, despite firm's tendency to serve their own interests (Blok 2013, 2017).

## Liberalism

John Douglas Bishop  
Trent University, Peterborough, ON, Canada

## Synonyms

Equality; Freedom; Individualism; Liberal democratic capitalism; Libertarianism; Neoliberalism; Open society; Property rights

## Definition of Liberalism

Liberalism is a complex cluster of political and moral values which arose in the seventeenth and eighteenth centuries in Europe and which has been central to politics and political thought in “the west” ever since. The key values of liberalism

are individualism, liberty or freedom, equality, human rights, democracy, rule of law, property rights, free markets, capitalism, social justice, and progress.

Liberalism comes in many forms, depending partly on which liberal values are advocated and partly on the priority of various values; more importantly, forms of liberalism depend on the definition and interpretation of liberal values. In particular, concepts of liberty (also known as freedom or autonomy) can vary greatly; such variations have led to different forms of liberalism, especially the split between big-government and small-government liberals.

## Description of Liberalism

All of the values of liberalism are applied at the level of the individual human being. Thus freedom means freedom for individuals, equality is equality of individuals, private property means ownership by individuals, and so on. Liberalism rejects such values as the greatness or power of states; pursuit of class, caste, corporate, or sectarian interests; and any other value that prioritizes the interests of any collective over those of individuals. For this reason, liberalism relegates to the private area of individual freedom opinions and beliefs about the purpose of life, life plans, conceptions of the well-lived life, religion, mores, sexual orientation, marriage, children, careers, conceptions of gender, and many other choices, values, and beliefs. Neither the state nor society has the right to interfere with individuals' commitments or choices in any of those areas. Because of this wide definition of private autonomy, the key political issue for liberalism is how to design just governments and laws for societies in which there is no agreement on religion, the purpose of life and other basic convictions (Rawls 1971, 2005).

Variations in conceptions of freedom give rise to the most significant differences of opinion among liberals, though all agree it is the freedom of individuals that matters. Negative freedom is freedom from external coercion, force or threats; an individual is free to do an action if there are no

laws or external threats that prevent that individual from doing that action. Positive freedom includes negative freedom plus the capability of doing the action. For example, I have negative freedom to buy a Bentley if there are no laws to prevent me from doing so and if the Mafia will not take it from me. I only have positive freedom to buy a Bentley if I also have or can borrow the money to pay for it. However, most liberals are more interested in freedom to commit to and implement life plans than in freedom to do specific actions; that is, I may not be able to afford a Bentley at the moment, but I am free if I could have chosen a life plan that included owning a Bentley. Also of concern to some liberals are internal restrictions on freedom; they would consider people as not free to do something if those people cannot know about or conceive of doing that action. For many liberals, a lack of education or literacy can restrain freedom as much as laws or violence.

Liberals value equality, but most do not advocate strict economic equality. What all liberals do value is social and political equality and what is best called equality of respect. In rejecting social inequality, liberals reject all social hierarchies, including those based on class, race, gender, caste, intelligence, education, or wealth. Historically, early liberalism defined itself as a reaction against feudal hierarchy, powerful remnants of which existed throughout the nineteenth and early twentieth centuries – indeed, Britain has still not ended inherited seats in parliament. Liberalism's rejection of political inequality commits liberals to democracy; they recognize that all people have an equal stake in social and political arrangements that will allow them to fulfill their own life-plans, and hence everyone deserves one and only one vote. Equality of respect for every individual means liberals champion human rights and champion equal rights for all individuals including the disabled, people of nondominant sexualities or genders, racial minorities, religious minorities, and all others open to stigmatization.

A belief in social and political equality also entails a firm commitment to the rule of law and equality before the law. Since no person, even those elected by a majority of voters, can ever legitimately claim the right to personally order

about any other person, all governments must function through laws established and enforced by legitimate democratic processes and applied equally to all people, even to those in government. Liberals also think that freedom requires that people are able to act within predictable and stable legal systems.

The freedoms defended by liberals include economic freedoms such as the freedom of individuals to own private property (including businesses, the means of production, land, natural resources, copyrights, patents, and trademarks), to participate in consensual exchanges, to form voluntary associations for the purpose of conducting business, and to sell their own labor and the products of their labor (Locke 1690; Mill 1859). In short, most liberals support extensive free markets, free trade, and capitalism. Liberals tend to limit free markets only by prohibitions on buying and selling people, human body parts, military weapons, and other objects and services which violate or threaten the security and freedom of individuals. Liberals also object to the buying and selling of political power; indeed libertarians (who are a type of small government liberal – see below) view the corruption of governments as such a serious and objectionable problem that they want to reduce government to a minimum (see *libertarianism*).

For a liberal, any unjustified restriction on personal freedom is a social injustice. Liberals are especially concerned with the oppression of groups of people; that is, they object to discrimination based on any irrelevant characteristic. For this reason, liberals campaign against racism, homophobia, Islamophobia, anti-Semitism, and so on. Liberals support civil rights for all identity groups – though it should be noted that it is the same rights and freedoms liberals advocate for all. Because of their belief in equality, liberals never advocate special rights for anyone.

Most liberals think that social injustices can be corrected; humankind can make nonviolent and nonrevolutionary progress toward a more just society. Indeed, progress has always been central to liberal beliefs. Liberals believe the widespread rational application of liberal principles will create societies which are free, peaceful, secure, and rich. The abolition of injustices may require

much effort and constant vigilance, but liberal democratic capitalism has already created the freest, most inclusive, longest-lived, and wealthiest societies humankind has ever achieved (see *the Great Enrichment*). Liberals believe more progress against specific injustices is possible and morally required.

## Varieties of Liberalism

Liberalism comes in several varieties depending on definitions of freedom and other values, the priority given to various values, and views about how the world works (especially about the relative effectiveness of governments and free markets). The most important split is between big-government liberals and small-government liberals. Big-government liberals think the government should be actively involved in creating the social conditions that make freedom, equality, and prosperity possible. Such liberals tend to support significant government roles in education, social welfare, pensions, healthcare, policies against injustices, and even support for the arts, research, and sports. In short, they resemble what some people call social democrats (though not socialists since liberals generally want most of the means of production to be privately owned and believe markets can be made to work fairly).

Small government liberals, of which the most consistent are libertarians, view all government action with skepticism (Nozick 1974). Often, they advocate the night watchman state; that is, they think the only proper role for government is to protect people and property. Governments should restrict their activities to police, armies, courts, prisons, and other protectors of peace and good order. Libertarian anarchists would like to see governments uninvolved even in those activities.

There are three key reasons for this split among liberals. The first is a difference in conceptions of freedom. Little-government liberals tend to restrict liberty to negative liberty; hence, the government should minimize its coercion (and taxation) of people and only concern itself with preventing criminals, thieves, knaves, and foreign

powers from interfering with citizens' negative liberty. Big-government liberals tend to have a conception of liberty that emphasizes the individual's capacity to act. For them, the government's legitimate role involves ensuring people are capable of exercising their freedoms. This involves a substantial role for governments in education, welfare, healthcare, and many other government services which ensure people have the ability to use the liberty that liberalism advocates.

But some small-government liberals, including many libertarians, derive their views not from a restricted definition of liberty but from the empirical claim that free markets are frequently, or even always, better at ensuring justice and freedom than governments are. This is partly an idealization of free markets, but even if they admit the common occurrence of market failures, libertarians think that government failures are a bigger threat to freedom. The most important government failures they cite are corruption, oppressive and greedy majorities, abuse of power, bureaucratization, intrusion into people's private lives, and inevitable government growth and bloating. Better, they say, to have market failures than government's ignorant and self-interested attempts to regulate markets and the outcomes of markets. American liberals and libertarians are especially prone to this negative view of government competence.

A third conceptual difference between big-government and small-government liberals concerns their views on the importance of private property rights. Some liberals think private property rights are sufficiently absolute that they view all taxation as a form of illegitimate confiscation. Some grudgingly think that taxation to pay for the night-watchman state is justified, but that is the sole purpose that tax revenues should be spent on. Big-government liberals acknowledge the importance of private property, but they point out that acquiring income and wealth is dependent on government-built infrastructure, government schools and universities, government research and development, and many other government activities. Hence there is no moral reason not to tax people to pay for these things.

It is sometimes said that liberty and equality are fundamentally incompatible values and that liberals differ according to which of these two they favor. However, care must be taken to see what is at stake here; it is only certain outcome-based views of economic equality that may not be compatible with freedom. In social and political spheres, freedom and equality are complementary and may be central to each other. Social equality means the absence of inherited hierarchies, and social freedom requires that all people be equally free to pursue desirable social positions. Fixed hierarchies are incompatible with both freedom and equality. A similar point can be made about politics; political freedom requires political equality. Freedom must be distributed equally.

Economics may be a different case. Although some liberals think that economic freedom requires a substantial degree of economic equality, others concede that government efforts to ensure economic equality involve limiting the economic freedom of some people. If a liberal values equality of outcome (i.e., a large degree of equality in the distribution of after-tax income and/or wealth), then strong and intrusive government action is probably necessary for achieving that equality. And such action is clearly threatening to the economic freedom of entrepreneurs, risk-takers, workaholics, savers, capable businesspeople, and all those whose exercise of economic freedom results in higher income or wealth accumulation. But if one looks at economic opportunity instead of wealth or income, many liberals think that equal economic opportunity is compatible with or even essential to economic freedom.

### **Varieties of Meaning of "Liberal"**

Although the word "liberal" properly applies to a wide variety of views on basic liberal values, the word has taken on more specific meanings in various countries. These inconsistencies can create considerable confusion. Liberalism as described in this article can be referred to as "classic liberalism." In the United States, "liberal" has

come to mean big-government liberalism, and it is often used as a label of contempt by people who dislike big government and who especially dislike the welfare state. The negativity associated with “liberal” in the United States has led some liberals to drop the term and refer to themselves as progressives. Small-government liberals in the United States often accept the label “libertarian.” Political convenience has associated libertarians with conservatives, but, conceptually, many American conservatives have views on authority, hierarchy, social mores, and other issues that are incompatible with liberalism (including libertarianism).

In Europe, “liberal” generally refers to a centrist compromise between governments and free markets – a compromise to the left of center in Britain and to the right of center on the Continent.

Parties that call themselves “Liberal” (known as Liberal with a capital ‘L’) vary greatly from country to country or even within countries. For example, the federal Liberal Party in Canada has quite different policies from the Liberal Party of, say, British Columbia.

To confuse usage further, the term “neoliberalism” is widely used to refer to small-government liberalism applied on an international and global level. Neoliberalism values free markets and free trade and is against government regulation, an extensive welfare state and the redistribution of wealth and income. Neoliberalism tends to dominate trade treaties, the WTO, and international economic organizations such as the IMF and World Bank.

## Criticisms of Liberalism

The most common reason for rejecting liberalism is based on the rejection of individualism. That is, many people believe that “the good” cannot be defined solely in terms of the aggregate good of individuals satisfying their own life plans. “The good” must, critics say, include the state of families, communities, classes, nations, and/or some other conception of identifiable groups of humans. Thus, liberalism is rejected as inadequate by communitarians, communists, and anyone

whose conception of a well-lived life includes living in a society with specific religions, language, moral, military, or other social characteristics. Religious beliefs, if they extend beyond individual private faith to strongly held views on social or legal issues, often pose significant problems for liberals. Liberals believe in religious tolerance, but not all religions believe in tolerating individual beliefs or actions in domains that liberals consider private and a matter for individual freedom.

Many people also complained that liberalism is hollow at its core and that liberalism provides no guidance about the purpose or meaning of life or about the virtues and characteristics of a well-lived life. In response, liberals suggest that the point of liberalism is to allow people with radically different views on the purpose of life to live together peacefully; liberalism intentionally does not pontificate on the meaning of life, leaving that to the autonomy of every individual. However, some liberals claim that the liberal values of tolerance, respect for others, strict separation of the private from the public spheres, and democratic participation are all virtues in a liberal society and that those go a long way toward conceptualizing a purposeful life and virtuous character.

Another argument against liberalism, or at least a reason that even liberals sometimes admit puts constraints on liberalism, is the problem of human security in a violent world of terrorism, wars, and organized crime. For example, surveillance of electronic activity and surveillance by video cameras and other means often invade the privacy and freedom of action of individuals dear to liberals but may be necessary for security. The proper trade-off between liberal values and security is difficult to establish.

## Summary

Liberalism is a cluster of political and social values, all of which emphasize the freedom, equality, and rights of individuals. Varieties of liberalism are determined by differences in interpretation and priority of these values and by differences in opinion about the relative effectiveness or corruptibility of

free markets and governments. Most importantly, small-government liberals advocate free markets, and big-government liberals support a large government role in education, healthcare, pensions, and other endeavors of the welfare state. Liberalism is rejected by people who value the interests of communities, the state, the proletariat, or some other group over the freedom and equality of individuals. Others complain that liberalism does not define any purpose in life. Finally, in the dangerous world we now live in, some think that security concerns should limit liberal freedoms and individual privacy.

## Definition

Libertarianism has two related aspects, often both believed by the same people. First, there is the libertarian defense of certain fundamental principles of justice and a vision of a just society that would result if these principles were the bases of law and government. Second, there are related libertarian views on law, economics, and social issues as they apply in the often unjust societies in which we currently live.

The key principles that underlie both aspects of libertarianism are these: first, that all people should be free from outside constraints on their liberty to live their lives in whatever way they choose (except insofar as everyone must respect the freedom, security, and private property of others). Restating this: no person or government should ever interfere with other people's freedom of action, their security of person, or their legitimately acquired private property. Second, private property can legitimately be acquired only by creation, just original acquisition, or free and consensual exchanges between free agents. In short, libertarians advocate perfectly free markets and free market capitalism (Hayek 1944).

Libertarians often sketch an utopia society in which government, laws, and individual morality are based on these two principles. Such a society, they argue, would be peaceful, secure, and very rich since security of private property would encourage people to create wealth.

Libertarian views on current social, economic, and political policies tend to include advocating laws, regulations, and policies consistent with the following values:

- Individual freedom of choice and action about how people lead their lives.
- Individual freedom to participate in free exchanges within free markets.
- Minimal government whose only responsibility is to provide security of person and property (often known as the "night-watchman state").
- Elimination or minimization of all taxes, possibly except those required to support the night-watchman state.

---

## Libertarianism

John Douglas Bishop  
Trent University, Peterborough, ON, Canada

## Synonyms

Free market ideology; Neo-liberalism; Small-government liberalism

- Elimination of all government regulations, especially regulations designed to produce a certain economic or social outcome.
- Elimination of all government attempts to redistribute wealth or income.
- Elimination of all government roles in welfare, healthcare, pensions, education, culture, consumer protection, and so on; elimination of the welfare state.
- Free trade between nations, and (often) free international movement of people.

## Description

Libertarianism is a form of liberalism; specifically, it is the most pure form of small government liberalism (see “► [Liberalism](#)”). Forms of liberalism can best be classified by their definitions of freedom; libertarians’ notion of freedom (called negative freedom) is that an individual is free if there are no external constraints on his or her actions. This is a rejection of capacity notions of freedom in which a person is free to do an action only if they have the capacity and means of doing that action. Also, it is a rejection of positive notions of freedom in which an individual is free if he or she has the internal ability to freely choose, not just to freely do (see “► [Liberalism](#)” and Berlin 1958 for further discussion).

## Defenses of Libertarianism

There are two sorts of defenses for libertarianism. The moral defense claims that the individual’s rights to negative freedom and to private property are fundamental ethical judgments. The alternatives to these principles, libertarians believe, are coercion, oppression, violence, theft, and wrongful confiscation. Since these alternatives are ethically unjustifiable, the fundamental principles of libertarianism must be accepted. Some philosophically minded libertarians (Nozick 1974) justified these fundamental principles on the basis of self-ownership, which is the idea that all individuals own their own bodies, their own labor, and the products of their labor. This idea may not be

necessary for acceptance of the fundamental principles noted above and has been criticized (Cohen 1995).

The second sort of defense for libertarianism has a utilitarian basis. It claims that any society which respects the fundamental principles of libertarianism will develop free markets and a form of capitalism that is driven by entrepreneurship, innovation, growth, and the creation of vast wealth. Everyone except the lazy and non-deserving will benefit from this wealth creation and everyone (as much as possible) will live long, healthy, safe, and comfortable lives according to their own choices. We will all enjoy security of person and private property.

## Clarification and Historical Notes on Libertarianism

Libertarian defenses of the right to private property derived from the writings of John Locke (see “► [Locke, J.](#)”) via Nozick (1974). Locke (1690) argued that the right to private property was more fundamental than government and that governments were formed primarily for the purpose of ensuring security of person and property. His justification of private property was based on his notions of just original acquisition and just transference. Originally, god gave the planet earth to all human beings to enjoy in common. Land became the property of a single individual when that individual invested his or her labor in the land to make it more productive. This removal of the land from common ownership by labor was justified providing there was as much and as good land left for other people to do the same. This proviso was eliminated by the invention of money and the option landless people then had of being hired by people who did own land. After original acquisition, land was justly transferred through consensual exchanges or inheritance.

Robert Nozick accepted Locke’s justification of the right to private property and argued that the only justifiable government was a minimal government designed to provide basic security to people and their property. The use of government

powers such as taxation for any other purpose amounted to unjust confiscation of private property and the violation of people's freedom to use and dispose of their property as they chose.

Many modern libertarians have been influenced by Ayn Rand's (1957) argument that people are obliged to respect the constraints of not harming others and their property, but that any expectation of altruism or other ethical principles that go beyond those constraints are disrespectful of a person's integrity and harmful of a person's justified self-respect. She also thought that altruism would undermine the entrepreneurship and drive of the wealth creators in society. However, these views are not a necessary part of libertarianism and many libertarians accept or even advocate altruism, charity, and generosity, providing only that these virtues are left to the private choice of the individual and are not enforced by coercion, taxation, or other government imposition.

## Criticisms of Libertarianism

Most fundamentally, libertarianism is rejected by anyone who disagrees with the fundamental moral values of liberty and equality. This would include authoritarians of any sort, those who think "too much" freedom will lead to social chaos, and all those who think a social hierarchy of any sort (whether traditional or merit-based) should be enforced.

Also common is the rejection of libertarianism by those who disagree with its individualism, believing instead that all humans are unavoidably embedded in families, communities, and nations. Such people often think that individual negative freedom is insufficient for people's conceptions of life, desires, and goals that can only be defined and pursued relative to those around them. The first thing most people do when free is to form families, extended families, communities, and nations. Critics of libertarianism claim that at a minimum families, communities, and nations need to coordinate values and actions. The libertarian cannot argue that we choose our family and community commitments; we do not choose the family or community that we are born into.

Libertarianism is incomplete in its emphasis on individual freedom if it is true that family and community are an essential part of a well-lived human life, and that family and community obligations cannot be fulfilled within the individualistic values of libertarianism. Consider the family: a parent's duties to young children, a family's duties to the disabled, and children's obligations to depended elders all go beyond libertarian constraints, and these duties are not supererogatory – they are requirements of any moral system, and they require positive interpersonal obligations not compatible with a purely negative notion of freedom. Libertarianism seems remiss in assuming every individual is a well-functioning adult capable of living a free and independent life (see "► [Economic Man](#)").

Libertarianism is strictly neutral about the purpose of life; people can use their freedom to pursue any purpose they wish providing only that they do not violate, or get the government to violate, anyone's freedom, security, or private property (Rothbard 1978). This neutrality regarding the purpose of life is considered a virtue by liberals (see "► [Liberalism](#)"), but a problem by many others, such as communitarians and anyone whose religion or cultural beliefs include communal preferences. The language laws of Quebec which are designed to preserve a French-speaking culture are a good example of a cultural goal that cannot be pursued without violating libertarian principles of individual freedom. A libertarian would only view such laws as acceptable if she thought that living in Quebec was voluntary, which it is in the sense that people in Quebec are free to move to other provinces without any government restraints, but such migration may conflict with family or community obligations.

Libertarianism is rejected by those who disagree with the claims that private property is morally as fundamental as libertarians think. They point out that a "no trespassing" sign on private land is an external constraint on a hiker's freedom and thus a violation of negative freedom. Objectors may also argue that some forms of private property ownership such as corporations can only be established and maintained by governments and government enforced laws. For corporations

to exist, the government and the legal system must recognize the creation of corporations as separate private property owning entities with limited liability, economic rights, and so on. The existence of corporations, it can be argued, is a huge government interference in free markets which results in corporate capitalism instead of free market capitalism.

Also, many reject the idea of just original acquisition. They point out that all land on earth has at some point been acquired by violence, conquest, and/or seizure. Consider, for example, the European settlement of America and the confiscation of Aboriginal land. The current owners of land in America may have acquired it through a just transaction, but if one follows the chain of transactions back, one always finds injustice and violent acquisition that was not consistent with libertarian principles of just acquisition and just transfer. If the current ownership of all land and property is not founded on principles of justice, then libertarianism faces a problem of defining a starting point for a just libertarian society. Some advocate starting with current ownership for utilitarian reasons of convenience (Narveson 2001), but that undermines much of the moral appeal of libertarian principles. Other libertarians suggest that everyone should be given capital when they join adult society at age 18 (to be financed by estate taxes), but that ignores the fact that many people do not understand capital, do not know that investments can generate income, and have been brought up in cultures in which money is spent immediately or it is stolen. Capital can be given to everyone, but not capitalist knowledge and values.

The utilitarian justification of libertarianism will be questioned by all who think free markets are or tend to be socially disruptive, and that free markets undermine the very values of trust, respect for others, and respect for private property that libertarians so greatly value. Polanyi (1957), for example, argued that a society must and will try to defend itself against the exploitations of free markets and capitalism. Marxists, of course, and political thinkers of a similar ilk, reject the private ownership of the means of production because it causes exploitation, alienation, and extreme

inequality (although Marx himself thought capitalism a necessary stage in the material progress of humankind.)

Libertarian defenses of minimal governments may not give sufficient recognition to the fact that libertarianism's own values of private property and freedom may be more threatened by market failures, corporate market power, fraud, crime (organized, control, white collar or other forms of crime), violence, and social disintegration than they are by governments. If it can be empirically shown that a welfare safety-net achieves security of person and property for much less expense than mass incarceration, then even proponents of the minimal state should consider such a safety-net acceptable.

## Summary

The fundamental moral values that underlie libertarianism are that no one and no government should ever interfere with any individual's freedom, security, or private property. Most libertarians acknowledge other values, such as family, community, and charity commitments, but view such values as purely private matters. Only the fundamental values should be enforced by social pressure and governments – indeed the only rightful role of governments is to protect individuals' freedom, security, and private property. Libertarians use their principles to argue for policies in societies as they currently exist and to sketch a prosperous and secure utopia in which their principles are generally respected.

## Synonyms

Freedom; Open society

## Opposites

Oppression, tyranny, colonialism, destitution, commitment

## Introduction

The words “liberty” and “freedom” generally mean the same thing and will be used interchangeably in this article.

Liberty can be divided into types based first of all on whether it is a people (country, nation, class, polis, etc.) that is free or separate individuals that are free. Freedom for individuals can be freedom from interference (negative freedom), freedom of having the resources and capacity to choose an

action (resource or capability freedom), or freedom to conceive of and live a way of life that individuals would choose if they could comprehend it (positive freedom). Existential freedom is a freedom we all have and can never escape, but the connection between existential freedom and commitment needs to be discussed. Once these concepts of freedom are elucidated, they can be applied to issues in economic freedom, liberty for businesses, and consumer freedom.

## Freedom of Groups of People

Benjamin Constant (1988 [1819]) called freedom for groups of people “ancient freedom” because it was much discussed by ancient Greek philosophers. For Plato, Aristotle, and many others of their time, a political community (or “polis”) was free if it was not under the control of another polis or empire. Their only concept of individual freedom was not being a slave. The ancient concept of freedom and its opposite, oppression, are still much use today especially in discussions of colonialism, self-determination, and separatist movements. The groups on behalf of whom claims for liberty are advanced can be nations, ethnic groups, provinces, classes, or religions. Oppressors can be foreign occupiers or central governments, but in the discourse of neocolonialism, the enemies of freedom are often local corrupt elites acting as puppets for multinational corporations, global financial elites, or foreign state enterprises. Corporate access to natural resources is a common motive for what some people call “neocolonial oppression.”

A good example of the use of the language of liberty in a separatist movement would be in Québec, when in the 1970s the FLQ (English = Front for the Liberation of Québec) advocated the separation of Québec from the rest of Canada. Charles de Gaulle visited and proclaimed “Vive le Québec libre!” (Long live free Québec!). He was asked to leave. The call for “liberty” for the Québec nation was powerful, though the people of Québec have twice voted in referenda to remain part of Canada.

## Negative Individual Freedom

Negative individual liberty is freedom from laws, regulations, force, violence, or threats that prevent or coerce an individual from doing an action. Freedoms of speech, of the press, of movement, and so on are generally negative freedoms. They can be interfered with by censorship, oppressive governments, powerful religious organizations, militarized police forces, organized crime, and other institutions exercising power to silence or detain individuals. It is not usual to say, except metaphorically, that freedom is restricted by non-human or natural forces or events. Snowstorms, for example, may block roads, but we do not say that they oppressively restrict liberty. Only human actions can oppress liberty.

Most people believe, or say that they believe, that extensive negative freedoms are morally valuable. And most philosophers in the Anglo-American tradition use liberty to mean individual negative liberty (Berlin 1958). However, people sometimes advocate interferences in other people's free actions; they advocate, for example, laws against hate speech, or they claim the "right" not to be offended by the speech of others. The language of negative freedom and trying to justify restrictions on negative freedom make the stakes in such debates clear.

## Resource and Capability Freedom

Lack of coercion that prevents an individual from acting does not do that person much practical good if she cannot access the resources she needs to do an action or if she has the resources but not the capability of using them (Sen 1985, 1999). For example, there may be no laws or threats which prevent people from traveling but (in a car-based rural area) lacking a car can restrict freedom, and even having access to a car will not do a blind person much good. Or another example, not only censorship restricts freedom of speech, but so do poverty, dependence on others for a living, and illiteracy.

There is a lot of political resistance to resource and capability notions of freedom, mostly based

on the worry that if many people do not have the resources for freedom, then someone will be morally expected to give them what they need. This implies redistribution of wealth and hence taking from those that have. With negative freedom, the moral expectations on others are only ones of refraining from coercion.

However, redistribution is not necessary to achieve resource and capability freedom if the socioeconomic system is designed in such a way that everyone can achieve resources and capabilities by their own efforts. Of course, there will probably always be exceptions concerning the severely handicapped, but "giving" people resources may not be generally required.

## Positive Freedom or Freedom from "False Consciousness"

One of the capabilities needed for freedom to live a certain way of life is the ability to conceive of the possibility, to conceive of the society in which that way of life is an option, and to recognize that such a way of life is superior to one's current life. This implies that freedom can come through education, experience, open-mindedness, and mind-changing art and literature. All of this is true and is good grounds for supporting public education, universities, art galleries, theaters, libraries, and so on.

However, positive freedom has historically led to an unfortunate emphasis on coercion (Berlin 1958). If a group of people such as the proletariat cannot conceive of their own freedom and they view the world through a false understanding of reality, then it becomes the duty of the vanguard who see reality clearly to force or coerce other people to be free. This line of thinking, both on the right and on the left, had horrendously disastrous results in the twentieth century and has given positive freedom very negative connotations.

## Existential Freedom and Commitment

Notions of existential freedom center on the claim that humans always have choices. Available

choices may be restricted by coercion, lack of resources, or physical restraints, but no matter how constrained humans are, they always have some choices to make, if only a choice of how to view and react to one's situation. In a modern free society, people's existence is swimming in thousands of choices daily; there is no escape from this existential freedom. Realization of its extent and necessity can make people anxious, a condition known as existential angst.

So perhaps modern societies, especially in the "West," allow too much freedom. The suggestion of too much freedom is heard often from people who have lived in traditional societies and who are now encountering modernity. It is a mistake to think that these critics of freedom are talking about negative freedom or are advocating more oppression and coercion. That would be a mockery of their thoughts. They are generally thinking of existential freedom and the angst that it causes. Limiting this sort of freedom, as Kierkegaard made clear, can come from an individual imposing on themselves ethical commitments – commitments to values, to marriage and family, to communities, to causes, and so on. Most important for many from traditional societies, but also for many conservatives in modern societies, is commitment to a religion. Since the individual limits her own freedom by making such commitments, there is no coercion or oppression involved.

## **Economic Freedom and Business Freedom**

Economic freedom is the freedom of individuals to engage in business activity as owners, entrepreneurs, consumers, employees, or contractors. Mostly, this is interpreted as negative freedom (i.e., a lack of constraints that prevent business activities), but in some cases, such as development banks or micro financing, the goal is to increase economic freedom in the resource for capability sense.

Business entities such as corporations have no inherent moral claim to freedom; ethical justifications of freedom for businesses are derivative

from the increased freedom that business freedom confers on the individual humans involved. In some cases, such as freedom of the press, freedom to form businesses and the freedom of businesses are indissolubly linked.

Libertarians argue that business freedom derives from the fundamental moral obligation that governments (and others) should not interfere with individuals and their private property. However, the connection between freedom and property is more complicated since one person's freedom to own a private property includes the right to interfere with (or coercively prevent) other people's use of that property. For example, the owners of cottages can interfere with the freedom of other people to access a lake. There is no question that a large degree of economic freedom in a society implies well-recognized rights to own a private property, including the right to own businesses and the means of production. However, the definitions of private property and of private property rights, and their moral justification, involve a balancing of the freedoms of property owners with the freedoms of others.

The right to incorporate a business is also an important economic freedom, but incorporation does not just need government noninterference; it needs the government to create the laws that recognize corporations and confer the legal ability of corporations to own a property, sign contracts, and generally engage in economic activities. In terms of economic freedom, recognition of the rights of employees to form unions has a similar ethical status as the right of businesses to incorporate.

Western business travelers to many parts of the world should not be startled by comments about "too much freedom"; it is generally not negative freedom the person is referring to – they are not advocating more oppression. Usually they are referring to existential freedom, and what they are advocating is more personal commitment to ethics, to one's community, to one's nation, or to God. Similar views are often expressed by conservative writers, though generally without the phrase "too much liberty." David Brooks, columnist for *The New York Times*, is an example.

## Conclusion

Businesses ought to recognize and value the freedom of all individual people because their own claim to freedom depends on the moral value of freedom for all people.

## Living Wage and Business Ethics

Andrea Werner  
Middlesex University Business School, London,  
UK

## Synonyms

Fair Wage; Just Wage; Subsistence Wage

## Introduction

The Living Wage (LW) is based on the idea that workers (and their dependents) should be able to afford a basic but decent living standard from the

wages they earn. The LW is a “relative” concept as it is set by the standards of the community in which the workers live and work (Stabile 2008). It is to be contrasted with the National Minimum Wage (NMW), a “wage floor,” which stipulates the minimum pay per hour to which workers are legally entitled. NMWs are not necessarily living wages, as in many national contexts they are rather cautiously set so as to ensure affordability for businesses and not to “undermine” economic competitiveness.

While early conceptions of the LW go back to Hellenistic and medieval thought, the LW came to prominence in the late nineteenth and early twentieth century when the squalor and poverty of factory workers became increasingly evident (e.g., Ryan 1906). The past few decades have seen a revival of the LW, most notably in the form of civil society campaigns in developed economies that have some of the largest proportions of low-wage workers, and are affected by in-work poverty and entrenched wage inequalities, such as the United States and the United Kingdom. There is also a growing focus on the LW in global supply chains and the developing economies attached to them.

The concept of the LW has direct implications for business organizations, as it concerns how much they pay their workers at the bottom of the pay scale and raises questions about the obligations of employers to their employees. As such, the LW should be of interest to business ethics and management scholarship, and not just remain an area of inquiry for economics, geography, political science, and labor studies, as it has until recently been the case.

In the following, the main philosophical arguments for the LW will be set out as well as some challenges and issues around the LW concept. This will be followed by some considerations regarding the importance and potential of the LW for business ethics inquiry.

## Philosophical Arguments for the Living Wage

Ryan (1906) conceptualized the LW as a *natural right* to which all laborers are entitled. The right to

a LW is a *derived* right, grounded in the original and universal right to subsist. Ryan argues that in societies that use wage systems as a form of industrial organization, employers, as owners of the resources appropriated from the “bounty of the earth,” have the responsibility to pay their workers a LW, as wages are workers’ only means through which their right to a decent livelihood can be realized.

More recent arguments for the LW have been put forward by the moral economy tradition. This tradition rejects neoclassical economic assumptions that wages are tied to (marginal) productivity, and that low wages are a logical consequence of low productivity, and holds that low wages persist due to a power imbalance between employers and employees (Stabile 2008; Figart 2001). Stabile (2008) puts forward three overlapping arguments for the LW – sustainability, capability, and externality – which are set out in more detail below.

### **Sustainability**

This argument is, at a basic level, about workers being paid a wage that enables them to *sustain* themselves. Stabile grounds his arguments for sustainability in a systemic, social utility view: If, because of low wages, workers are forced to work long hours, this would diminish their strength and longevity, and lead to a depletion of resources. This concern, which was already shared by early economic philosophers such as Adam Smith and industrial sociologists Beatrice and Sidney Webb, is still of relevance today, in particular in relation to immigrant workers, who may have to hold down several jobs to make ends meet.

Wages enabling the workers to sustain themselves are about more than food: They are also about those necessities that enable a worker to participate in society, which include decent accommodation, transport, clothing, and personal care. These requirements may change over time and are subject to cultural norms and macroeconomic circumstances.

### **Capability**

Related to, and an extension of, the sustainability argument is that a LW should enable workers to

enhance their capability. Stabile explicitly refers to Amartya Sen’s work on capability. Sen (1999) distinguishes between functionings, capabilities, and commodities. Functionings refer to the various “doings or beings” that a person achieves and thus to the quality of a person’s well-being. A person’s capability refers to the freedom to achieve the functionings that are important to them, reflecting a person’s freedom or real opportunity to lead the type of life they value. Income is considered an important, though not the only, means to enhance capability as it allows the purchase of commodities through which a type of life that is valued by the person can be achieved. Sen argues that even *relative* deprivation in income (for example, a relatively poor person in a rich country) can lead to *absolute* deprivation in terms of capability as more income is needed to buy enough commodities to achieve the same functionings.

Beyond the relevance of capability to the well-being and freedom of individuals, Stabile (2008) refers to people’s capability in regard to the functions they have as members of society and as workers, and parents. For example, because workers on a higher wage can afford to work fewer hours to make ends meet, they would also have more time available to spend quality time with their children, to attend evening classes to attain additional qualifications, or to get involved in their local communities.

### **Externality**

Externality relates to the fact that low wages impose cost on others. In contemporary settings, low wages pose a cost to society as they have to be supplemented by means-tested welfare payments such as housing benefit or free school meals, so that people’s needs are met. In effect, this means that tax payers subsidize employers, who can then carry on using workers as a low-cost resource. Furthermore, because business organizations do not pay the full cost of the “resource” they are using, they will produce too much of their product due to their lower costs, and thus resources are being used inefficiently (Stabile 2008), another negative externality.

## Challenges and Issues

Despite these firm arguments that support the idea of a LW, there are a number of challenges and issues attached to the LW concept. These include:

### The Difficulty of Calculating a Living Wage

The first challenge is posed by the fact that the LW is a relatively “loose” concept, depending on cultural norms and customs. What income people require to sustain themselves and enhance their capability will always be a matter for deliberation and discussion. This is made even more complicated by the debate as to whether a LW should be based on the needs of an individual or their family, and whether welfare payments to which certain households are entitled should be considered in the calculation of a LW rate. From a practical point of view, it would be unreasonable to demand from employers to pay different LW rates to different employees according to their individual needs and family situation, if they are doing essentially the same work.

Many LW movements have chosen to pursue a pragmatic approach. They promote an hourly LW rate that is based on a basket of essential goods and services that a household needs to ensure a basic standard of living in a particular geographical region as established by well-regarded instruments such as the Minimum Income Standard in the UK or the MIT Living Wage calculator in the USA. In order to get around the problem of different household sizes, in the UK, LW rates are calculated based on “averages” of subsistence needs of a selected number of different household types, while in the USA the concept of an “ideal” household consisting of full-time earner and two to three dependents has been used (see Werner and Lim 2016 for more detailed discussion). While such approaches may fall short of meeting the needs of all workers, what is important to LW movements is that the instruments used to calculate the LW enjoy legitimacy and that the hourly LW rate they promote makes a real difference to low-wage workers in comparison to them trying to survive on the NMW.

Another possibility to determine the LW is that workers negotiate a LW themselves with their employers (Stabile 2008). This approach can be found, for example, in the guidance provided by the Ethical Trading Initiative for supply chains in developing economies. Such approach may be considered a challenge in environments where organized labor is discouraged, and workers are not equipped to engage with the concept of the LW. It is interesting to note that in some countries such as in the UK, the official calculated LW rate is increasingly being used in collective bargaining processes (Heery et al. 2017), indicating the value of a precalculated rate.

### The Living Wage Does Not Solve Problems of Underemployment and Precarious Work

Hourly LW rates promoted by LW campaigns are calculated on the assumption that a worker is in full-time employment. As such, the LW movement does not explicitly tackle the problem that people may be underemployed, that is, that they would like to work more hours than is offered to them, or that they are on employment contracts which do not guarantee any fixed amount of work and income. In addition, the LW alone does not guarantee “good quality jobs” as the promotion of an hourly rate does not include considerations of working conditions (shift patterns, work load, etc.) and job security. This raises the criticism that LW campaigns may have a too-narrow focus, and thus make only a limited difference to the lives of workers.

### Who Is Responsible for Ensuring LWs Are Paid? Mandatory Versus Voluntary Approaches

The *externality* argument for the LW requires one to consider how responsibility for ensuring that people have a decent level of income that secures their livelihood should be allocated.

There is a view that it is the responsibility of governments to supplement wages if they are not high enough for people to care for themselves and their families, in the form of housing and child benefit, for example. While this argument has some merit, other observers are critical of the

problem of low pay and in-work poverty being *solely* addressed through the payment of benefits, rather than through higher wages. They would argue that higher wages would enable governments (and thus taxpayers) to *save* on welfare payments that supplement work income. And some would add that work should be the center of any welfare reform, especially in view of the fact that a life without having to depend on the help of others enhances people's autonomy, and in view of the personal and social dimensions of work (Waltman 2004).

If it is accepted that people should be able to (largely) secure their livelihoods through the wages paid to them by their employers, the question arises what "internalization mechanisms" should be adopted: regulation (mandatory approach), voluntarism, or government incentives.

A number of LW advocates favor a mandatory approach that governments make the LW the legal minimum that employers have to pay. Such approach would create a level playing field among businesses, and it would be *collectively* in the interest of business as higher wages would increase overall purchasing power (Waltman 2004). Others, however, warn of adverse unintended consequences if the LW were to be made mandatory, especially in contexts where the current NMW is low. They warn, for example, of increases in unemployment, price increases, and fewer entry level jobs ("labor substitution effects"). While such adverse unintended consequences may not materialize at a significant magnitude – as studies on mandatory local "LW ordinances" in the USA suggest (Pollin 2005), there are nevertheless concerns over abrupt mandatory implementations of the LW at national level, as transitional costs to the economy and society are thought to be more likely.

Others, therefore, favor a *voluntary*, accompanied with an accreditation scheme for employers, as found, for example, in the UK LW campaign. A voluntary approach may avoid a number of above listed unintended consequences, as the LW will be implemented more gradually. This more gradual implementation, on the other hand,

limits the positive effect for low-wage workers in the economy overall, as only those who work for accredited LW employers will benefit from a higher rate of pay. Voluntary approaches tend to emphasize the "business case" (Heery et al. 2017). That is, they argue that those employers paying at least a LW to their employees benefit from reduced staff turnover and a subsequent reduction in recruitment, training, and supervision costs, as well as a better motivated, and thus, more productive, workforce, which will offset the costs of a higher wage bill. LW accreditation is also held to generate positive reputational effects for employers.

Others, again, argue for government incentives and "soft regulation," as positive effects of voluntary adoption may not fully offset higher costs attached to LW implementation. Inclusion of LW requirements in public procurement policies, or a reporting requirement on adherence to the LW in Corporate Governance codes for all stock-market listed companies, are examples of this "third" internalization approach.

## LW and Business Ethics Inquiry

Beyond knowledge of the philosophical arguments for the LW and of the challenges related to the concept, the LW, as an area where employer practices intersect with societal concerns, opens up important and fruitful areas of inquiry for business ethicists.

The first one concerns engagement of employers with the LW. In contexts where paying the LW is not a legal requirement, what *motivates* employers to voluntarily adopt the LW? How important is the business case for the LW, or are there other motivations at play, too? What might prevent employers from adopting the LW, and what are the main obstacles? To what extent and how would answers to these questions vary for different types of business organizations (e.g., different ownership patterns, sizes, and sectors)? Emergent empirical research on LW-accredited SME employers indicates that employers are not only motivated by instrumental reasons, but that

moral and civic motivations play a role also. This research also shows that employers who already have progressive pay policies in place, or for whom an uplift to the LW will not add too much to their wage bill, are more likely to seek LW accreditation rather than those employers whose business model is heavily dependent on low-wage work (Werner and Lim 2017). Another interesting area of inquiry is to what extent and how might the LW be used as a basis for new business models that truly value the contribution of workers and lead to a different quality of value creation, thus challenging the status quo of low-wage business models.

Beyond motivation, another important area of inquiry concerns the *ethical implementation* of the LW in organizations. What do employers do to accommodate the LW? Are any costs related to LW implementation being simply absorbed or are changes made to staffing levels, work hours, work load, costs in other areas of the organization, etc., to accommodate a higher wage bill? What are the ethical implications of these changes? A particular pertinent ethical challenge of LW implementation pertains to pay structures and differentials. Will the introduction of the LW to employees on the lowest pay tier lead to a pay rise for those on higher pay levels (potentially making implementation of the LW rather expensive, thus, not financially viable), or are pay differentials allowed to decrease over time? If the latter, this can create situations where different conceptions of fairness (need vs equity) are in conflict. A similar ethical challenge exists where the LW wage replaces incentive structures (such as performance related pay or overtime bonuses), as employers need to ensure that these changes are introduced fairly and not demoralize employees (Werner and Lim 2017).

A second broad field of inquiry focuses on the dynamics and mechanisms designed to encourage and aid LW adoption among employers, emanating from governments, civil society organizations, and the wider public. What are effective incentives and pressure points that make companies adopt the LW? How can civil society organizations effectively engage with employers to

implement the living wage – a question particularly pertinent when it comes to the adoption of the LW in supply chain factories. What is the role of unions and of customers in driving the LW forward?

A third and final area of inquiry pertains to the impact of the LW on employees. This has for some time been the focus of attention of organizational psychologists, who in particular use the capability perspective as analytical lens (e.g., Carr et al. 2017). But it is also potentially a fruitful field of inquiry for business ethics and management scholars, especially as it touches on issues of stakeholder value creation.

The LW is not the only way to address issues of low wages, inequality, and in-work poverty. However, it is an idea that – short of the introduction of a universal basic income – is not likely to go away and is likely to remain a forceful concept that will help make at least some steps toward achieving fairer economies in which everyone is allowed to flourish. The LW is, therefore, also likely to remain an area of scholarly interest, research, and debate.

## Locke, J.

John Douglas Bishop  
Trent University, Peterborough, ON, Canada

## Introduction

John Locke (1632–1704) was an English philosopher who made major contributions to epistemology and ontology in his monumental *An Essay Concerning Human Understanding* (1690), a work often considered as laying the foundations of British empiricism. He also wrote important works on education theory and religious tolerance. However, his works most relevant to business ethics are his writings on private property and government (Locke 1988 [1690]) which developed the theories that will be discussed in this entry.

## Historic Background

Locke's views on property and government are best seen as a response to Thomas Hobbes. In his book *Leviathan* (Hobbes 1968 [1651]) and in other writings, Hobbes began with the assumption that all people were independent agents who pursued their own interests. Their most important interest was survival. In a state of nature (i.e., in a state in which there was no government), every individual would be competing against all others

for survival. Life in such a state, Hobbes famously said, would be “solitary, poor, nasty, brutish, and short” (chapter 13, para 9). Since no one individual human was ever strong enough to be secure against all others, the wisest course of action would be for all to agree to form or accept a government which was powerful enough to defend the security of every individual. People, for their own protection, would agree in a social contract to form an all-powerful government.

Several aspects of Hobbes argument should be noticed. The social contract is a contract among people *about* the formation of government; it is not a contract between people and their government. Hobbes' social contract should be viewed as a logical device, not as an actual historic event. The purpose of government was the physical security of all people; as long as the government did not threaten people's security, it was a legitimate government. The form of government – monarchy, dictatorship, parliamentary democracy, or oligarchy – was not specified; a legitimate government could take various forms. The necessary purpose of government according to the social contract did not include protecting private property, only security of person (though there might be derivative arguments for private property).

Two other historic backgrounds to Locke need mentioning. The first is seventeenth-century British attempts to settle North America. This process of settlement needed a theoretical foundation that would give ownership of land settled by Europeans to those Europeans and not to the Indigenous people who had hitherto lived on those lands. Locke provided that foundation. Perhaps it should be mentioned that he had substantial financial investments in a corporation set up to settle Virginia.

Second, Locke's thought should be seen against the background of the development of capitalism. In particular, justification was needed for the claim that markets should be allowed to function independently of government control. Further, the market exchange of land and labor, which was then a recent development, needed to be included in a theory of justice.

So, the problem for Locke was to establish the right to private property as more fundamental than governments, but to do so by using Hobbes' assumption of individualism and the social contract. And to do it in a way which justified European settlement of North America.

### **Locke's Argument for the Right to Private Property**

Locke begins his argument by imagining humans living in a state of nature – that is, living without any government. But unlike Hobbes' war of all against all, Locke imagined people hunting, gathering, and laboring to feed themselves. In such a state, all land was the common property of all people because God had given the earth to all humans for them to use for sustenance. However, once a person had labored to obtain food, such as hunting a deer or picking an apple, then the products of his or her labor belonged to the laborer provided no one ever took more than he or she could consume before it rotted. Land could be removed from the commons by any individual who labored to improve the land; primarily, this meant clearing the land and planting crops. Land so labored on became the private property of the laborer. This process of removing property from the commons is generally referred to as "original acquisition." Once private ownership was established, a piece of property could justly be transferred to a new owner by mutual consent or by inheritance. Locke's famous proviso applied to original acquisition – that is, there had to be "as much and as good" left for others to acquire in a similar fashion.

But even if the state of nature was not constant war for Locke, people would have the problem of defending themselves and their property, and for this purpose, they instituted governments. The key point here is that governments were instituted to protect property as well as persons; the right to property is prior to and the basis of government. Thus, any government interference with anyone's private property is a violation of that individual's rights and a violation of the legitimate purposes of government.

England in the seventeenth century was a long way from the state of nature. It had a powerful central government, a few people own huge amounts of land, and there was no common land that the poor could homestead and claim. Original acquisition as a process was long over. Where did this leave Locke's proviso that there had to be as much and as good for everyone? And what about the constraint that no one should claim as property more than he or she could farm and consume all the produce of? Locke's answer was that the establishment of money removes both of these constraints, the proviso because people without property could sustain themselves and their families by exchanging their labor for wages. And since money did not rot or spoil, then there was now no limit on the land and capital any individual might acquire.

Applying Locke's theory to the right of Europeans to settle North America and claim the land as private property highlights several aspects of this theory. According to Locke, at the time of European contact with North American Indigenous people, the "Indians" (his usual term) were hunters who wandered aimlessly in small groups looking for animals to hunt. Locke even expressed the fear that they might get lost. Since they had not invested their labor in the land, they have no property rights to it. European settlers who labored to clear and farm the land thereby established their right to own it. There seemed to be plenty of land for Indigenous people to stop hunting and become farmers as well, so the proviso was satisfied. By inheritance and consensual transfers, current Americans have gained legitimate rights to the land that they now own.

### **Use of Locke's Theory Today**

The importance of Locke's theory of private property and government is that it is often used today to provide a moral basis for the private ownership of the means of production, for free markets, and for capitalism in general. Locke's claim that the only just role of government is to protect private property is used to justify limiting government to the "night-watchman state" (Nozick 1974).

Locke's theory is often appealed to by libertarians to justify the primacy of the right to private property (Narveson 2001).

And indeed, Locke was an important theorizer of the capitalism that was fast developing in England by the seventeenth century. Besides limiting the role of government, Locke justified the commodification of labor and land. Under feudalism, land could be acquired only by inheritance or conquest and could not be bought or sold. Labor was owed as feudal dues; hiring labor played a very limited role in the feudal economy. That role greatly increased after the plague of the "black death"; Locke's contribution was to theorize wage labor as the norm (Macpherson 1962). Bringing land and labor into market relationships was key to the rise of capitalism (Polanyi 1957).

## Criticisms of Locke

Locke's theory of private property rests on the common moral intuition that every person legitimately owns their own labor and the products of their labor. The problem is not with this intuition itself, but with Locke's use of it to justify a system of private property rights that underlies and justifies capitalism. In a capitalist economic system, laborers do not own the product of their labor; the capitalist owner of the means of production owns it. This incoherence in Locke's theory left an opening for Marx to wield his labor theory of value and to make his claim that under capitalism labor was alienated from the product of its labor.

As a justification of the current ownership of private property, Locke's theory fails because historically there seems to have been very little or no just original acquisition. Consider North America where Locke explicitly held his theory to apply. We now recognize that Locke's information about North American Indigenous people was faulty. For example, as far north as the Hurons of Central Ontario, many Indigenous people were farmers (at least part time) who did clear land. Hunting lands may not have been owned by individuals, but they were not a commons open to all; clans, tribes, and nations carefully guarded them and

often had a responsibility of care for the land – care that amounted to investing their labor in Locke's sense (Bishop 1997). And, of course, they had governments, sometimes, as with the Five (later Six) Nation Confederacy, very sophisticated governments. This throws into doubt Locke's claim that governments are subsequent to private property and created to protect the private property owned by individuals. If, as we now must concede, North American was taken by conquest, then the current ownership of land does not derive from legitimate original acquisition. This throws into doubt use of Locke's theory to justify the current ownership of property.

As a justification of capitalism, Locke's theory fails to legitimize market power such as monopolies or oligopolies. Because of the proviso, it also fails to justify the ownership of patents on vital goods such as drugs even if the patent is owned by the drug's discoverer. (There may be utilitarian justifications for such patents; the point here is that Locke's theory of private property does not defend them). Further, there is nothing in Locke's theory that justifies corporations owning property or people owning corporations as private property. Locke's theory of private property does not mention incorporation or limited liability.

The proviso applied to modern capitalism seems to imply a right to a job. But capitalism as an economic system requires a "reserved army" of unemployed. Consider, for example, the reaction of a central bank if a nation's unemployment rate dropped all the way to zero. Fear of inflation would cause the Central Bank to raise interest rates until unemployment reappeared. This undermines Locke's assumption that the proviso no longer applies because every person could, he thought, obtain employment and wages from those who own property. Currently, the forces of automation, outsourcing, deskilling, corporate oligopolies, and the global movement of capital are undermining Locke's justification of private property rights because Locke explicitly based his theory on the proviso that everyone could produce and sell enough to sustain themselves and their families, even if the only thing they had to sell was their own labor. Some politicians, capitalists, and theorizers are beginning to consider a universal

basic income (UBI) as the best way to preserve the justice of a capitalist economy based on Locke's theory of the private ownership of productive property.

## Summary

John Locke provided an early (seventeenth-century) and influential moral justification of private property rights as more fundamental than, and not dependent on, government. He also justified the buying and selling of land and labor, which was essential to the capitalism that was developing in Britain at the time. His arguments are still used today, especially by libertarians. However, the moral legitimacy of his justification of private property is dependent on his proviso, which implies that no one should be excluded from being able to earn an income adequate for herself or himself and her or his family. It is not clear whether contemporary capitalism meets this proviso.

## Loyal Agent's Argument

Alex C. Michalos

University of Northern British Columbia, Ottawa, ON, Canada

## Synonyms

Agent loyalty; Limits of loyalty; Loyalty to principal; Loyalty; Misplaced loyalty

## Definition

This is a critique of one of the most frequently used arguments by agents in defense of inappropriate, morally wrong, and/or illegal behavior.

## Description

Leaders in business and in politics often expect and even demand loyalty from presumed and avowed followers, and followers often expect and even demand that of themselves. Apart from the hierarchical relationships between leaders and followers, loyalty characterizes many other kinds of associations. Indeed, in a fine analysis of philosophical issues concerning loyalty, Kleinig (2013) remarked that “Our *loyalty* tends to be expressed in *loyalties*. That is, it is tied to certain kinds of natural or conventional associations, such as friendships, families, organizations, professions, countries, and religions.” It is also tied to ideas and causes, and if physicist Max Planck's (1858–1947) suggestion is correct that scientific theories die when their supporting theoreticians die, it is even tied to scientific theories.

As one would expect, a concept so thoroughly imbedded in human relationships has received considerable attention by philosophers, as illustrated by Kleinig and by essays on loyalty and whistle-blowing in this encyclopedia. In this essay, we will not attempt to review this literature.

Our aim is mainly to explain a rather dangerous but widespread argument concerning loyalty and business ethics. The argument identified in Michalos (1977) is called the “loyal agent’s argument” (LAA) and it runs as follows:

1. As a loyal agent of some principal, I ought (morally) to serve his or her interests as he or she would serve them if he or she had my expertise.
2. He or she would serve his or her own interests in a thoroughly egoistic way.
3. Therefore, as a loyal agent of this principal, I ought to operate in a thoroughly egoistic way in his or her behalf.

Because the word “ought” may be used to indicate a moral obligation and/or merely a matter of self-interest, the sense intended in the LAA is parenthetically flagged as moral. It is assumed that an agent defending his or her actions with LAA wants those actions to be appraised from a moral point of view, as the right thing to do morally speaking, presumably based on any plausible moral theory. It would not draw much sympathy and would be self-defeating for such an agent to have his or her appraisers believe that his or her motive was purely or even mainly self-interest, i.e., because, after all, it was smart or there was more in it for him or her behaving as he or she did. Poff (2005) considers such a case. It is also assumed that egoistic behavior is such that in conflict situations when there are not enough benefits to satisfy everyone, the actor will try to see that his or her own needs and wants are satisfied, whatever happens to the needs and wants of others. He or she may believe that invisible hand theorists are right because if everyone behaves in this way the world’s resources will be used in a maximally efficient way and everyone will be materially better off. But this is a secondary consideration. The egoist’s first consideration is to look after *Numero Uno*, himself or herself.

In the light of these assumptions, let us evaluate the LAA’s soundness beginning with the second premise. This premise can only be regarded as true of all people a priori if the first of the assumptions

just made is false. That is, the assumption in the first premise is that the actor himself or herself is or has behaved in a non-egoistic, moral way in behalf of someone or something else. So, if it is possible for actors to behave this way, it cannot be true that all actors must act in an egoistic way, i.e., the second premise cannot be granted as true a priori.

Can the premise be defended as a well-confirmed empirical hypothesis? Yes, but that does not serve our agent’s interest. If it is a good bet that the second premise is true, then it is an equally good bet that anyone inclined to defend his or her actions with LAA is not a non-egoistic actor. Evidence for the empirical hypothesis that people generally act as egoists is evidence for the truth of the second premise and the falsehood of the assumption made of the agent’s motives in the first.

What about the first premise? In a way it looks and is as good as motherhood and apple pie. Kleinig’s (2013) “working definition” of “loyalty” appropriately includes the claim that loyalty implies a “potentially costly commitment to secure or at least not to jeopardize the interests or well-being of the object of loyalty.” The trouble is that it must not be assumed that the “commitment” is unlimited. In this respect, it is like most moral principles and rules of law. Short of turning every principle and rule into a self-contained treatise, it is impossible to indicate every possible exception. Even well-formed maxims like “it is wrong to kill people” are controversial in cases involving self-defense, war, capital punishment, and euthanasia. Regarding the first premise as an unlimited constraint on an agent’s behavior would elevate the premise to a supreme moral principle licensing any and all behavior serving the interests of any old “object of loyalty,” evil or good, wise or foolish, and just or unjust. Clearly, loyalty itself cannot be granted such supremacy.

In conclusion, it is fair to say that while loyalty is a good thing, it is not the only good thing and the LAA does not provide a good reason for pressing it into service in support of every sort of enterprise or object.

## Machiavelli

Clive R. Boddy  
Tasmanian School of Business and Economics,  
University of Tasmania, Hobart, TAS, Australia

### Definition

Niccolò Machiavelli was a Florentine statesman, patriot, diplomat, military leader, and writer who lived from 1469 to 1527.

### Description

His books include *The Prince*, *Discourses on Livy*, and the *Florentine Histories*. He is included in this encyclopedia because he inspired an unethical and cynical approach to politics and management, termed “Machiavellian” as discussed below. For further information see especially Berlin’s essay on Machiavelli (Berlin 1971) and, for example, Giorgini’s review of scholarship on Machiavelli’s *Prince* which details the different ways in which *The Prince* has been interpreted down the ages (Giorgini 2013; Zuckert 2013). The Cambridge Companion to Machiavelli and the essays within it is also a good source of material on Machiavelli (Atkinson 2010).

Born into a prominent, learned, and mainly wealthy family that was indebted at the time of

his birth, Machiavelli was a diplomat for 14 years in Italy’s Florentine Republic during the Medici family’s exile. At this time Machiavelli worked for the Chief Magistrate, Piero Soderini, as secretary and advisor. In this role he met politicians as he traveled within the four states within present day Italy and across Europe, including Louis XII and Cesare Borgia. Machiavelli thereby gained experience of international politics. He was also involved in military tactics, successfully organized infantry forces, and established a Florentine militia, including one to try and prevent (unsuccessfully) the Medici’s return. When the Medici family did return to power in 1512, Machiavelli was dismissed, having been a republican, and was jailed and tortured. He wrote *Il Principe* immediately after this experience in 1513–1514, leading some to view the book as a bitter expose or satire rather than a set of recommendations to tyrants aimed at helping them stay in power.

The book’s title character, “the prince,” may have been based upon the infamous Cesare Borgia, who was an enemy of Florence at the time or perhaps on the Medici’s. Whether the original intent was satirical, an attempt to disclose the cruelty of tyrants and its moral toll on the people, or not, *The Prince* has since been regarded as a guidebook for politicians and managers on the use of ruthless cunning, and it inspired the terms “Machiavellian” and “Machiavellianism.”

Machiavelli has been referred to as the father of modern political science based on his

achievements and writings and especially because of his book *Il Principe* (The Prince) (Machiavelli 1531 (Translated 1961)). Originally written for presentation to Giuliano de Medici (perhaps as an attempt to regain a diplomatic appointment), after Giuliano's death Machiavelli sent a copy to Lorenzo de Medici as a guide to how a prince should rule his subjects. This action was not well-received by the people of Florence as Machiavelli had been a noted republican against the Medici. Thus when the Medici's were again driven out of Florence in 1527 and a new republic initiated, Machiavelli was not asked to be a part of the new government and he died later that year.

*Il Principe* was ostensibly and overtly aimed at politicians but has been taken up by management researchers who describe his concepts as being as applicable to today's management as they were 500 years ago in Renaissance Italy (Calhoon 1969). In *The Prince*, Machiavelli advises a ruler not to honor his word when it would be disadvantageous to do so, further advising that other people, being unreliable liars and cowards, would not keep theirs. He writes that a ruler should be courageous, loyal, honorable, and public minded but also, when necessary, a great liar and deceiver. The ruler should know when to act immorally in pursuit of a state that was stable and lasting and be prepared to use fear as a means of control.

The princely statesman, wrote Machiavelli, must use guile and cunning in order to guarantee the success and prosperity of the state and the people, even if this also means that the statesman thereby has to keep the riches of office (Barnett 2006). This, to some readers was a shockingly blatant, secular, and godless description (McCormick 2011) of political realism, and it tarnished Machiavelli's reputation for hundreds of years in Christian Europe and beyond.

## Machiavellianism

Clive R. Boddy

Tasmanian School of Business and Economics,  
University of Tasmania, Hobart, TAS, Australia

## Synonyms

Aggressive narcissism; Executive psychopathy; Industrial psychopathy; Machiavellian; Manipulative-ness; Organizational psychopathy; Political psychopathy; Primary psychopathy; Successful psychopathy

## Definition

Machiavellianism is a term used, often pejoratively, to describe a deceitful, cunning, manipulative, and conniving personality or style of management or leadership. This Machiavellianism involves a disregard for personal ethics and morality when necessary and has come to imply a focus on self-interest and personal advancement.

Machiavellians are deemed likely to get to the top of organizations because of their ruthless and adroit political skills and their self-promoting activities.

Based on their reading of Machiavelli's book *Il Principe* (The Prince) (Machiavelli 1531 (Translated 1961)), Richard Christie and Florence Geis developed a measure of a person's level of Machiavellianism called the Mach – IV test (Christie and Geis 1970). This is a personality questionnaire containing 20 statements relating to personal beliefs and attitudes. The research describing the construct validity of their measures was presented in their book called "Studies in Machiavellianism." However for a counter-view of Machiavelli's work see Grace and Jackson (2014) who point out that the Mach – IV scale is not as well-connected to the actual works of Machiavelli as is popularly imagined in management circles.

## Description

In his writings Machiavelli overtly supported the use of power and craftiness as tools in the service of the state, recommending that leaders be ruthless like a lion and cunning as a fox. Machiavellianism has consequently been conceptualized as a form of behavior which has no anchor in moral principles and promotes the idea that the end justifies the means.

As employees Machiavellians are more likely to be absent from work without a valid reason, engage in sexually deceptive tactics and intentions towards infidelity and not be satisfied in their jobs. Machiavellian leaders are associated with less well-performing organizations.

Machiavellians are thus dishonest, unscrupulous and crafty, and they sacrifice morality for power and material success. Machiavellianism suggests the use of a fraudulent persona when necessary (entailing the use of apparent friendliness, honesty, charm and tact to gain advantage). Machiavellianism also advocates a political approach to management and advocates the use of force if deemed necessary to achieve desired ends.

Christie, based on Machiavelli's writings, characterized a Machiavellian as being someone who has: low ideological commitment, a lack of concern with conventional morality, a lack of interpersonal emotion, a lack of gross psychopathology, and as someone who is willing and able to manipulate others through any means needed including deception (McHoskey et al. 1998). This academic management view is not shared by political scientists, historians, and some marketers, e.g., (Giorgini 2013) who point out that Machiavelli's advice was primarily concerned with the pragmatic protection and safety of the state and its people from unrest, invasion, and the denial of freedom. In other words, Machiavelli was not Machiavellian in the sense that the term has come to be understood in management and psychological research. For example, Machiavelli wrote that: "A Prince . . . should not deviate from what is good, if that is possible, but he should know how to do evil, if that is necessary" (p. 75/76) (Machiavelli 1531 (Translated 1961)). In other words, he recommended an ethical approach to leadership, apart from when it was necessary, for the greater good of the state and its people, to be unethical. This is arguably a realist approach to management.

Machiavellians (as they are understood in management research) tend to detach themselves from ethical considerations and to manipulate and use other people to profit themselves. The personality trait, Machiavellianism, correlates (among other things) with primary psychopathy, individual absenteeism, unethical attitudes, a relativistic morality, lying for gain, bullying behavior, sensation seeking, lower social responsibility, the ability to read social cues, a polished self-presentation, commitment to one's own career, and social dominance, among others. Furthermore some researchers contend that there is a demonstrable and continuing societal movement toward increasingly Machiavellian behavior in society.

Several authors believe that Machiavellianism and psychopathy – particularly primary psychopathy (rather than secondary psychopathy which is more criminally oriented in character) – are essentially the same personality trait. The difference being that the characterizations stem from

different disciplinary traditions and terminology. This is a view which the author of this encyclopedia definition has considerable sympathy with. In descriptions of the respective personalities, the main difference between psychopaths and Machiavellians is that the former have no conscience whereas the latter may have a conscience but choose to ignore it in certain circumstances.

## MacIntyre and Business Ethics

Matthew Sinnicks  
Southampton Business School, University of  
Southampton, Southampton, UK

## Introduction

Scottish philosopher Alasdair C. MacIntyre (1929–) is the most widely cited virtue ethicist in the business ethics literature (Ferrero and Sison 2014). This is somewhat surprising, given MacIntyre's own hostility to business. According

to MacIntyre, our economic and social order is fundamentally compartmentalised (1999a), and we inhabit an emotivist culture in which ethical discourse is largely an expression of untutored feeling (2007). In light of this, he has suggested that the problems of business ethics are insoluble (1982), that management is inherently amoral (2007), and that business ethics courses are a waste of time (2015). Despite such claims and the obvious relevance of his critique of management, the radical nature of MacIntyre's thought is taken up relatively rarely in the business ethics literature (though see Couch and Bernacchio 2020; Sinnicks 2021). The following discussion begins with a summary of this critique of management before going on to explore the aspect of MacIntyre's work which has had the greatest influence in business ethics, his account of practices and institutions in *After Virtue* (2007 [original publication 1981]). It then concludes with an overview of the relevance of MacIntyre's more recent work for business ethics.

## Critique of Management

MacIntyre suggests that contemporary social life can be understood as a drama in which certain characters – the therapist, the rich aesthete, and the manager – play leading roles. These characters, suggests MacIntyre, provide our “culture with its moral definitions” (2007, p. 31). Unlike ordinary occupational roles, these characters “place a certain kind of moral constraint on the personality of those who inhabit them” (MacIntyre 2007, p. 27). Of the three contemporary characters MacIntyre identifies, he regards the manager as especially important. He claims that:

the manager represents in his character the obliteration of the distinction between manipulative and non-manipulative social relations . . . The manager treats ends as given, as outside his scope; his concern is with technique, with effectiveness in transforming raw materials into final products, unskilled labor into skilled labor, investment into profits. (2007, p. 30)

Because of this, the manager is incapable of genuine moral engagement and is instead an

embodiment of emotivism, the “boo-hurrah” theory of moral meaning according to which statements of moral praise and blame are nothing other than expressions of subjective feeling. On this view, to say “X is wrong” is simply to say “I dislike X, do so as well”. Hence, the distinction between manipulative and non-manipulative social relations is obliterated: all methods of bringing someone to disapprove of X are equally legitimate, according to this view. This status as inherently manipulative is not a matter of individual failing; it is instead an essential feature of the managerial role and thus aligned with the self-understanding of management. Managers:

are seen by themselves, and by those who see them with the same eyes as their own, as uncontested figures, who purport to restrict themselves to the realms in which rational agreement is possible – that is, of course from their point of view to the realm of fact, the realm of means, the realm of measurable effectiveness. (2007, p. 30)

According to MacIntyre, such a separation of means from ends gives management a distinctively Weberian flavour. This is because it allows management to understand and present itself as calculating ever more exact means by which to achieve the preset end of profit in line with Weber’s account of bureaucratic rationality. On this view, ends are not open to rational evaluation, only means, and bureaucratic experts – managers – are charged with devising and implementing these rational means.

However, MacIntyre regards this bureaucratic expertise as impossible and suggests that attempts to successfully formulate lawlike generalisations in the social sciences, of the kind required to support any claim to bureaucratic expertise, are bound to fail. He notes that:

given the best possible stock of generalizations, we may on the day be defeated by an unpredicted and unpredictable counter-example – and yet still see no way to improve our generalizations and still have no reason to abandon them or even reformulate them. (2007, p. 93)

Few would seek to defend management on the grounds that it is based on knowledge of lawlike generalisations in the social sciences. Many, including many impressed by MacIntyre’s broader body of work, would defend management

on the grounds that it can, and often does, avoid collapsing into mere manipulateness. For example, while Moore suggests that it “seems clear that the basic tenets of [MacIntyre’s] position, at least in respect of managers in business organisations under Anglo-American capitalism, remain in place” (2008, p. 495), he nevertheless concludes that MacIntyre’s argument for the amorality of management is incorrect: “Are managers simply the morally-neutral efficient achievers of pre-determined ends? Clearly... the answer is no” (2008, p. 505). While it may be the case that value-laden management – and leadership – remains susceptible to the charge of emotivism (see Sinnicks 2018), Moore’s reason for this judgement is that on his view, and contrary to MacIntyre’s own, management, properly conceived of, is a practice. This concept of practices is at the core of MacIntyre’s understanding of good work and indeed serves as a foundation for his account of the ethical life.

## Practices and Institutions

MacIntyre’s thought reserves an important place for the concept of good work. Indeed, he claims that we “ought to eat in order to work, not vice versa. The classical expression of this view is Aristotle’s, but all artists, most professors and some socialists believe it too” (1979, p. 44). His more detailed and influential discussion of good work occurs in his account of practices, the first of three states – along with narrative unity of a human life and traditions of enquiry – of his definition of virtues. To engage in a practice requires us to acquire and exercise the virtues, and indeed some virtues are required by all practices. For instance, we require courage to open ourselves up to the criticisms of other practitioners, justice to ensure that each contribution to the practice is suitably recognised, and so on.

It is worth noting that MacIntyre uses the word “practice” in a highly specific way:

By a “practice” I am going to mean any coherent and complex form of socially established co-operative human activity through which goods internal to that form of activity are realized in the

course of trying to achieve those standards of excellence which are appropriate to, and partially definitive of, that form of activity, with the result that human powers to achieve excellence, and human conceptions of the ends and goods involved, are systematically extended. (2007, p. 187)

This definition has been central to contributions in business ethics which draw on MacIntyre's work, as such contributions often take the form of arguments in favour of certain forms of work being worthy of the status of practices. The key aspect here is the notion of goods internal to practice. These are goods which cannot be achieved in any way other than by engaging in the activity in question. MacIntyre provides a variety of examples of practices. They include architecture, chess, portrait painting, physics, football, and farming. Examples of non-practices include bricklaying, throwing or kicking a ball with skill, and turnip planting (2007, p. 187). According to MacIntyre, to:

enter into a practice is to enter into a relationship not only with contemporary practitioners, but also with those who have preceded us in the practice. . . Practices never have a goal or goals fixed for all time – painting has no such goal nor has physics – but the goods themselves are transmuted by the history of the activity. (2007, p. 194)

Clearly then, practice engagement involves intellectual discovery and requires commitment and creativity, and the historical mediation foregrounds MacIntyre's discussion of tradition-based enquiry (see 2007, ch. 15). Indeed, MacIntyre is keen to highlight the role of the relevant community for those who engage in practices. He says, "whether we are painters or physicists or quarterbacks or indeed just lovers of good painting or first-rate experiments or a well thrown pass", we must subordinate "ourselves within the practice in our relationship to other practitioners" (2007, p. 191). This admission of peripheral practitioners – lovers of well-thrown passes as well as those who play with excellence – is telling and expands the scope of practices considerably. However, it also highlights the importance of proper motivation, as it allows that the devoted admirer of, say, football can experience the relevant internal goods more meaningfully than the skilled, but entirely extrinsically motivated, player.

This issue of extrinsic motivation takes us on to another important aspect of MacIntyre's discussion of practices, particularly as it relates to business ethics: how practices relate to institutions. Institutions pursue external goods – money, fame, power – rather than internal goods. Practices thus need institutions if they are to survive – tennis needs tennis clubs, fields of enquiry need schools and universities, etc. However, they are also threatened by institutional acquisitiveness. It is this interplay that is at the heart of much research in business ethics that draws on MacIntyre's work (see, in particular, Moore and Beadle 2006).

However, MacIntyre also notes that "the making and sustaining of forms of human community – and therefore of institutions – itself has all the characteristics of a practice" (2007, p. 194). This practice MacIntyre names politics, in its Aristotelian sense. While the challenge of institutional domination, along with the critique of management outlined above, should make us wary of drawing too optimistic a picture of management from MacIntyre's work, this point allows us to conceive of managers as being engaged in a practice, politics. Furthermore, the expanded understanding of practice engagement helps us to see how managers may be partially engaged in the practice their organisation houses, even if it is worth remembering that MacIntyre continues to believe that the "practice of the virtues. . . is something difficult to reconcile with functioning well in the present economic order" (MacIntyre 2008, p. 6).

## Beyond *After Virtue*

Given the preeminence of *After Virtue* within MacIntyre's oeuvre, as well as the obvious relevance of his critique of management and his account of practices, it is unsurprising that it has dominated MacIntyrean contributions within business ethics. Nevertheless, there is much in MacIntyre's work since that is relevant to our attempts to navigate the ethical challenges presented by work, capitalism, and commercial life, even though this has been perhaps underexplored in the business ethics literature.

MacIntyre (1999a) argues that role-structured activity, of the sort required by much contemporary work, undermines moral agency because it forces us to compartmentalise the different and competing demands of the various roles we hold. This compartmentalisation prevents us from adequately perceiving the conflicts that exist between our professional and personal lives because we are unable to achieve a role-transcendent evaluation of those demands.

One noteworthy application of MacIntyre's more recent work has been developed by Bernacchio (2018), who draws extensively on MacIntyre's *Dependent Rational Animals* (1999b). In this work, MacIntyre corrects the non-metaphysical conception of ethics advanced in *After Virtue* by reflecting on the reality of human vulnerability and extends his "account of practices, institutions, and communities by illustrating the indispensability of uncalculating relationships that are sustained by virtues that serve to direct agents toward the needs of others" (Bernacchio 2018, p. 380), which Bernacchio then explores with reference to cooperation between members of ostensibly competing organisations in the garment industry.

MacIntyre (2015) addresses the ethics of finance and argues that it is incompatible with four habits that are necessary for proper moral agency: an ability to properly appraise one's own talents, an ability to distinguish between reasonable and foolhardy risks, a commitment to the common good, and the habit of focusing neither "on the present at the expense of the future nor on the future at the expense of the present" (2015, p. 10). MacIntyre (2015) also takes issue with the view that judicious reforms to business ethics curricula could lead to a significant improvement in how finance is practiced: the study of business ethics, thinks MacIntyre, "is a dangerous distraction" (2015, p. 8). The argument MacIntyre offers here has been challenged by Rocchi et al. (2021), who appeal to the ways in which finance can contribute to the creation of various common goods.

In his most recent major work, *Ethics in the Conflicts of Modernity* (2016), MacIntyre

suggests that we need to learn key truths "about the destructive and self-destructive aspects of capitalism" from Marx (2016, p. 97), that militant trade union action is a prerequisite for even "elementary justice" in contemporary society (2016, p. 107), and that market societies such as ours must treat the vice of acquisitiveness as a virtue (2016, p. 109). However, just as with *After Virtue*, where his account of practices and institutions gives us grounds for both a critique of work in contemporary society and hope about our ability to find community and engage in meaningful and good work within this society, MacIntyre (2016) also provides resources that might underpin more constructive work in business ethics. In particular, MacIntyre acknowledges that, while rare, it is still possible to find contemporary work in such good order that "[m]ore experienced workers become teachers. Managers become enablers" (2016, p. 132).

This affirmative comment on management is coupled with an approving discussion of renowned management consultant, W. Edwards Deming. In the 1950s, Deming convinced Japanese automobile manufacturers that production lines in which workers perform a single, repetitive task are less conducive to quality than those in which teams of workers cooperate and take responsibility for the product as a whole. In the latter case, says MacIntyre, the:

ends informing the workers' activity are now those of achieving through shared deliberation and decision the making of an excellent car and of becoming excellent in making such cars. It matters that they understand what they are doing and that their standards are ones that they have made their own, not standards imposed by external managerial control. They share direction toward a common good. (2016, pp. 170–171)

While Deming would not frame his thought in the language of common goods, what is notable from the perspective of attempting to apply MacIntyre's work to business ethics is the fact that MacIntyre remains alive to the ways in which relatively achievable improvements to work can contribute to our flourishing, even as he keeps the ways in which most work frustrates that flourishing clearly in view.

## MacIntyre, Alasdair

Andrew West

School of Accountancy, QUT Business School,  
Queensland University of Technology, Brisbane,  
QLD, Australia

## Introduction

Born in Scotland in 1929, the philosopher Alasdair MacIntyre is frequently characterized as one of the key figures responsible for revitalizing the virtue ethics tradition in late twentieth-century moral philosophy. His work, however, extends far beyond an examination of the virtues or character traits of moral agents, and, as he has drawn on Marxist, Aristotelian, and Thomistic philosophies to varying degrees through the course of his career, his views have wide-ranging economic, political, as well as moral implications.

## Marxism and Liberalism

MacIntyre's early writing reflects a Marxist perspective that he adopted from the 1950s. In 1953, he published *Marxism: An Interpretation*, in which he explored the relationship of Marxism and Christianity and highlighted certain systematic injustices associated with the capitalism of the Western world. This work was revised and published as *Marxism and Christianity* in 1968, and in the introduction to the 1995 edition he explains these injustices as being of two kinds. The first is related to the deficiencies of character that are displayed by particular individuals within the confines of the prevailing capitalist norms. This includes, for example, the dishonesty and insatiable acquisitiveness of those who perpetrate fraud. The second kind, however, refers to injustices within the capitalist system itself and has three distinct aspects. The first of these relates to the structural inequality between capital and labor; it is reflected in the instrumentalization of labor, the impersonality of relationships, the lack of any “justice of desert” in labor markets, and the

absence of any association of work with the “common good.” This “injustice of exploitation” (2002, p. 148) is not mitigated by an increase in the standard of living. The second aspect of this injustice is reflected in the lack of freedom (and lack of consent) implicit in many market relationships, where the terms of exchange are imposed on labor and on small producers (where, for example, producers of a particular product may be forced to accept low prices due to a drop in market demand). The third aspect involves acquisitive consumerism and the disposition to acquire ever more consumer goods, that is both the aim of activity and the mark of success in capitalist society. Noting that this acquisitiveness was traditionally (by Aristotle and others) the vice contrasted with the virtue of justice, MacIntyre thus claims that “Capitalism also provides systematic incentives to develop a type of character that has a propensity to injustice” (2002, p. 149).

While MacIntyre has continued to maintain this view of capitalism as systemically unjust in these different ways, he has rejected Marxism as a political alternative. This is due to his opposition to Stalinism, his views on Marxism as a social science (together with his own critique of social science itself), and its own contradictions (where “those who make the conquest of state power their aim are always in the end conquered by it and . . . become in time the instruments of one of the several versions of modern capitalism” (2002, p. 150)). However, MacIntyre has also made his rejection of political liberalism clear. He gives as reasons three observations (2002, p. 153); the first is that trade unions that have worked to reform capitalism from within have in fact lost their power, the second identifies the absence of any genuine participation in liberal politics by the vast majority, and the third notes how liberalism’s individualism and its association of morality with individual preferences excludes that consideration of the common good that is essential to participatory community (and its notion of justice).

## After Virtue

MacIntyre’s most well-known work, *After Virtue*, reflects the development of MacIntyre’s thought

regarding the justification for morality, an issue of significant concern since being faced with Stalinist atrocities that he could condemn, but where the justification for such condemnation itself remained in doubt. First published in 1981, *After Virtue* begins with the “disquieting suggestion” that modern moral discourse is in a complete state of disrepair. That is, moral debates and prescriptions have adopted an emotivist character and amount to expressions of preference (such as “Damn thievery – do so as well!”) that cannot be rationally justified, even though they may be accompanied by the appearance of rational, objective moral argument. MacIntyre traces this moral state to the Enlightenment (and post-Enlightenment) attempts to provide a rational account and justification for morality (notably in utilitarian or Kantian terms), projects that have ultimately failed (and, MacIntyre argues, were doomed to failure). Faced with either Nietzsche’s rejection of Western morality or a re-consideration of premodern Western moral philosophy, MacIntyre prefers the latter and sets out his view for a renewed Aristotelian approach to morality.

## The Bureaucratic Manager

In his critique of modern moral discourse, MacIntyre identifies a number of “characters” that model and encapsulate the modern moral approach and can be considered archetypes of emotivism. These include the aesthete, the therapist, and the bureaucratic manager, with the latter being of particular significance and influence in the contemporary cultural milieu. Characterized as an expert who draws on well-established, objective technical knowledge to make unbiased decisions that enhance effectiveness, the bureaucratic manager is given substantial authority. However, MacIntyre considers such a manager to embody a moral fiction. He describes the limitations of the social sciences (itself an Enlightenment ideal), focusing on their inability to provide law-like generalizations, their lack of predictive power, and absence of neutrality, and argues that the manager’s technical authority accordingly lacks appropriate rational justification. Consequently, the manager’s claims, while having the appearance of legitimate authority, amount to no more than (emotivist) expressions of preference.

Indeed, like the moral fictions of utility and rights, the bureaucratic manager's technical authority (and the emphasis on effectiveness) can be seen as a means of social control and manipulation. In this sense, the bureaucratic manager also represents one of the incoherencies of modern liberal individualism, where the uninhibited pursuit of one's own moral autonomy requires manipulating (and limiting) the moral autonomy of others.

### The Neo-Aristotelian Alternative

Following Aristotle, MacIntyre's conception of morality focuses on the good for each individual, the virtues (or excellences) required to achieve this good, and the importance of the good of the community. This is articulated in several ways, providing a progressively complete account of virtue. Firstly, MacIntyre locates the good in particular types of activity that he describes as "practices," where:

By a 'practice' I am going to mean any coherent and complex form of socially established cooperative human activity through which goods internal to that form of activity are realized in the course of trying to achieve those standards of excellence which are appropriate to, and partially definitive of, that form of activity, with the result that human powers to achieve excellence, and human conceptions of the ends and goods involved, are systematically extended. (2007, p. 187)

He includes football, chess, architecture, painting, physics, and farming as examples of practices. Associated with each of these practices are particular "internal goods"; for chess he proposes "a certain highly particular kind of analytical skill, strategic imagination and competitive intensity" (2007, p. 188) and for painting he includes excellence in both the process and product of painting activity. For a practice to be established and maintained, however, institutions are required (which could include football clubs and universities for example). Such institutions necessarily deal with the allocation of "external goods" of power, wealth, and status, and while these remain "goods," MacIntyre identifies a tension between institutions and practices where the "ideals and creativity of the practice are always vulnerable to the acquisitiveness of the institution, in which the cooperative care for common goods of the

practice is always vulnerable to the competitiveness of the institution" (2007, p. 194).

Particular dispositions or character traits that are required in order to achieve the internal goods associated with any practice (and to resist the "corrupting influence" of institutions) are then identified. At a minimum MacIntyre considers Courage, Justice, and Honesty to be essential to all practices.

Although there are clear implications for how this scheme of practices and institutions, internal and external goods, and virtues might be applied to productive work and organizations, this remains only a partial conceptualization of virtues and the good life. MacIntyre proceeds to argue for the importance of understanding our individual lives as a "narrative unity"; that our behavior cannot be adequately understood without a long-term appreciation of our intentions and setting. He contrasts this with the compartmentalization of much modern life, such as in the distinction between one's workplace and home-life. In order to achieve wholeness and counteract such compartmentalization, he posits the virtue of Integrity/Constancy, whereby one's moral character and aims are consistent across differing contexts and times.

The pursuit of one's individual good through practice and throughout one's life is then complemented by the recognition that all individuals are members of some communities (including families, nations, and professions). Each of these communities has its own history, provides its own moral cues, and thus contributes to the formation of our moral and social identity. MacIntyre completes his account of virtue by identifying the need to be aware of one's own and alternative traditions.

### Recent Work

Although *After Virtue* is MacIntyre's most influential work, it has fallen to others to provide a detailed application of key aspects of this work to business (see Beadle (2015) for an overview of how MacIntyre's work has influenced research in business ethics). Nevertheless, there are a number

of areas in which MacIntyre has (subsequent to publication of *After Virtue*) further articulated his ethical stance concerning business and economics. In *Whose Justice? Which Rationality?* (MacIntyre 1988) for example, he describes internal goods and external goods as “goods of excellence” and “goods of effectiveness” respectively, re-emphasizing the problematic nature of a (managerial) focus on effectiveness, and in a 1999 lecture elaborated on the meaning of “compartmentalization,” together with the relevance of integrity and constancy. In a book chapter published in 1994, while responding to various criticisms of *After Virtue*, MacIntyre illustrated his critique of contemporary business structures and his focus on community by providing an example of two fishing crews. In one of these each crewmember is motivated by individual gain and will look for alternative work as soon as the conditions no longer suit his goals, and in the other, each crewmember considers himself to be part of a genuine community in which he recognizes the bonds that tie crewmembers and their families together. Indeed, MacIntyre suggests that the Aristotelian ethical outlook is likely to be more easily understood and practiced by “farmers and fishermen” than by those in financial, legal, and academic professions.

Lastly, opening a collection of essays on how his ethics could be related to the economic sphere, MacIntyre has considered the work of financial traders, and has argued that much of contemporary business ethics education is misplaced, in as far as it believes that in order to avoid future scandals, ethics needs to be “added” to a nonmoral education in business and economics. He specifies several ways in which such business ethics education is “irrelevant.” Firstly, business ethics education as we know it does not contribute to the development of moral character or to moral transformations; secondly, the traits required by successful financial traders are contrary to the traits required of morally responsible agents, and thirdly, how people think about the relationship between ethics and money itself is incoherent. Consistent with *After Virtue*, MacIntyre argues instead for a reconceptualization (drawing on Aristotle, Aquinas, and Marx) of financial and

economic relationships in terms of virtues and vices (he identifies intemperance, injustice, and imprudence in particular). Closing with some principles which could inform how credit is granted, MacIntyre illustrates how there remains considerable practical work in applying a contemporary Aristotelian approach to business.

## MacIntyrean Approach to Employee Rights

Caleb Bernacchio  
California State University, Monterey Bay,  
Seaside, CA, USA

### Synonyms

Neo-Aristotlean ethics and the rights of employees

### Introduction

Virtue ethics is frequently thought of as being inherently opposed to notions of rights. Alasdair MacIntyre (2007), for example, a prominent proponent of virtue ethics is also known for his emphatic critique of theories of human rights. MacIntyre's account of virtue ethics has also made a significant impact within the field of business ethics. A number of scholars (see Beadle 2017; Moore 2017), have developed an extensive account of business ethics employing MacIntyre's goods-virtues-practice-institutions schema. This account focuses on the role of organizations as the context of social practices focused upon common goods and sustained by the virtues of participants. Because of the perceived tension between virtue ethics and rights theories, scholars drawing upon the MacIntyrean perspective in business ethics have rarely addressed the question of employee rights. This article proceeds by summarizing MacIntyre's critique of theories of human rights, before briefly outlining the MacIntyrean approach to business ethics, and introducing a notion of employee rights grounded within the MacIntyrean framework of goods, virtues, practices, and institutions (Bernacchio 2020).

### MacIntyre's Critique of Rights

MacIntyre's (2007) *After Virtue*, one of the most significant works of moral philosophy published

in the twentieth century, played a major role in the resurgence of interest in virtue ethics as a distinct approach within moral philosophy. The book includes both critical and constructive elements (Lutz 2012), critiquing various modern moral theories (see Anscombe 1958), before developing a distinctive neo-Aristotelian account of virtue ethics. MacIntyre's criticisms extend to utilitarianism, Kantian deontology, existentialism, as well as emotivism and intuitionism, among other positions. Likewise, MacIntyre develops a trenchant critique of rights theories. Two points concerning this critique are worth noting.

First, MacIntyre's criticisms extend to philosophical theories of *human rights*. He says, "By 'rights' I do not mean those rights conferred by positive law or custom on specified classes of person; I mean those rights which are alleged to belong to human beings as such and which are cited as a reason for holding that people ought not to be interfered with in their pursuit of life, liberty and happiness" (MacIntyre 2007: 68–69). Thus, MacIntyre targets theories of human rights wherein subjective rights provide a normative foundation for obligations on other persons rather than conventional rights grounded in specific institutional or social contexts. This issue is addressed below in the context of the issue of employee rights. Second, MacIntyre's primary claim is that there are no adequate philosophical arguments in support of human rights. He says, "The best reason for asserting so bluntly that there are no such rights is indeed of precisely the same type as the best reason which we possess for asserting that there are no witches and the best reason which we possess for asserting that there are no unicorns: every attempt to give good reasons for believing that there are such rights has failed" (MacIntyre 2007: 69). Accordingly, he rejects appeals to intuition or claims that human rights are self-evident. Thus, MacIntyre's position is incompatible with any account of employee rights that would treat such rights as foundational normative features accruing to employees merely because they are human beings and thereby grounding obligations on employers.

## MacIntyrean Business Ethics

The constructive aspect of MacIntyre's (2007) account (Lutz 2012), fuses virtue ethics and practice theory. MacIntyre (2007: 185) defines a practice as "any coherent and complex form of socially established cooperative human activity through which goods internal to that form of activity are realized in the course of trying to achieve those standards of excellence which are appropriate to, and partially definitive of, that form of activity, with the result that human powers to achieve excellence, and human conceptions of the ends and goods involved, are systematically extended." Practices are collaborative contexts where participants pursue shared goals and adhere to socially constructed standards of excellence. The virtues play an essential role within social practices, ensuring that participants adhere to the shared standards of excellence partially constitutive of the practice, rather than opportunistically pursuing their own goals. For example, within the practice of chess, honesty ensures that players refrain from cheating even when this behavior may be undetected. More generally, the virtues ensure that participants remain committed to excellence within the practice rather than merely success or "winning."

Within business ethics, researchers have drawn upon MacIntyre's account of practices, goods, virtues, and standards of excellence, arguing that organizations can be conceptualized as practice-institution combinations that are sustained in the pursuit of excellence by members' virtues (Moore 2017). From this perspective, organizations are virtuous to the extent that they embody a good purpose (Moore 2017; Tsoukas 2018), and balance the pursuit of excellence and success, enabling their members to engage in meaningful work through the exercise of virtue (Beadle and Knight 2012). In this way, organizations promote human flourishing, among their members, and the common good, more broadly. While this account details the role of the virtues it raises the question of what, if any, role do notions of employee rights play within the virtuous organization.

## A MacIntyrean Theory of Employee Rights

The MacIntyrean approach to employee rights hinges on the idea of rights conferred by participation in practices. Baseball, for example, confers specific rights on players, giving batters three strikes each time they come to bat and teams three outs per inning. Given that organizations involve productive practices, that is, rule-governed modes of collaboration (Moore 2017), what rights do practitioners, especially employees, have insofar as they are members of these practices?

MacIntyre (1983: 10) distinguishes between natural rights and conventional rights of three types: rights conferred by law, rights stemming from promises, and "those rights which participants in practices enjoy in virtue of the rules constitutive of practices." Whereas natural rights, or notions of human rights, "were intended to provide a standard independent of all positive enactments or promises and all particular established social roles, statuses and institutionalized practices," the rights conferred by practices do not abstract from the social context in this way (MacIntyre 1983: 10). As such, they are not susceptible in the same manner to the criticisms that MacIntyre (2007) levels against theories of natural rights. In other words, rights conferred by participation in practices do not abstract from the social context but are rather grounded in the particular relationships that individuals are involved in.

How do productive practices confer rights on their participants? Within practices, participants make commitments to the internal goods specific to the practice (MacIntyre 2007; Tsoukas 2018). In effect, this commitment is constitutive of one's participation in the practice. One cannot play chess without some appreciation for the specific type of excellence achievable within the game. Likewise, participants are committed to the standards of excellence constitutive of the practice. Adherence to these standards of excellence requires one to treat fellow practitioners appropriately, as determined by these standards, As

MacIntyre (2007: 192) says, “Just as, so long as we share the standards and purposes characteristic of practices, we define our relationship to each other, whether we acknowledge it or not, by reference to standards of truthfulness and trust, so we define them too by reference to standards of justice and of courage.” Accordingly, employee rights are specified by the virtue of justice in the context of “productive practices,” practicing involving work within organizations (Moore 2017). What does the virtue of justice require of participants in productive practices? How should employers treat employees insofar as they are participating in a shared productive practice? In short, justice requires that members of the practice accord each other several rights including rights to just wages, safe working conditions, employability, non-discrimination, due process, transparency, participation in governance, and respect or non-domination.

First, justice requires a fair distribution of the external goods resulting from collaboration within the practice. This is especially the case because of the substantial time commitment that employees must make to achieve excellence within the practice. Second, employees must be granted safe working conditions as far as this is possible since it is not possible to participate in the practice on equal terms, as justice requires, if employees are forced to work in unsafe conditions merely because of their lower status within the organization. Third, justice implies the right of employability (Werhane et al. 2004), such that employees should gain knowledge and skills that make them more employable in the future through their participation in the practice. In other words, it should be the case that “practitioners become better through participation” (Bernacchio 2020: 235), especially because practices are inherently directed toward human flourishing (MacIntyre 2016; Moore 2017) such that participation should lead toward improved human capacities to achieve excellence (MacIntyre 2007: 187). Justice also requires non-discrimination as any treatment of persons based upon factors unrelated to the standards of excellence in the practice, like gender

or race, is arbitrary and unjust (MacIntyre 2007: 192).

Three additional employee rights, specifically due process, transparency, and participation in governance are direct implications of a central feature of practices: the fact that participants ought to be able to collectively define the goals and standards of excellence of the practice (MacIntyre 2016: 131). Without due process, employees may be treated arbitrarily limiting their ability to fully participate in the organization’s core practice, preventing them from contributing to the determination of the goals and standards of excellence characteristic of the practice. Similar considerations apply to transparency since it is not possible to fully participate in the practice without appropriate information. Likewise, without the ability to offer opinions and input into managerial decision-making, employees have a limited ability to shape the goals and standards of excellence characteristic of the practice. Thus, employees must have the right to participate in governance, at least to be consulted by management. Finally, employees have a right to respect or non-domination. This right “means that employees do not have a duty to indulge managers’ requests to perform personal services, i.e., washing a private car, or doing errands, or supporting specific political candidates” (Bernacchio 2020: 236). These types of requests are arbitrary and unrelated to the standards of excellence of the core practice. Thus, it is unjust for managers to use hierarchical power to benefit themselves in a way that does not further the aims of the practice.

Together these rights can be thought of as a right to meaningful work (Beadle and Knight 2012). They represent the requirements of the virtue of justice within the context of productive practices. These rights are not abstract human rights but implications of participating in productive practices, obligations falling upon practice members if they are to treat fellow practice members according to the standards of excellence partially constitutive of their shared practice (MacIntyre 2007: 192). Because managers have greater hierarchical authority and are responsible for the formal organizational structure, they have

greater responsibility to ensure that employees are accorded these rights.

## Conclusion

MacIntyre's (2007) account of virtue ethics is often thought to be incompatible with notions of rights. While MacIntyre's framework has made a significant impact within business ethics (2017), this raises the question of how the MacIntyrean approach relates to notions of employee rights. Drawing upon the notion of rights conferred by participation in practices (MacIntyre 1983), the MacIntyrean approach to employee rights addresses this question.

## Maintaining Data Integrity

Charon A. Pierson  
Committee on Publication Ethics,  
Gilbert, AZ, USA

## Synonyms

Data lifecycle; Data maintenance; Data storage; Quality control; Reliable data; Uncorrupted data; Valid data

## Definition

Data integrity requires that data for any project, paper, business, and research must be reliable and trustworthy throughout its lifecycle. Reliable and trustworthy data are not only secure, but they are regularly checked for accuracy and accidental or malicious corruption. Data must be backed up to assure that critical information is not lost. The word integrity derives from the Latin *integritas* meaning intact. Integrity is a fundamental moral and ethical value applied to individuals who are honest and trustworthy; the term has been adopted to apply to data, its storage, maintenance, and use.

## What Are the Issues?

Researchers, business enterprises, governments, regulators, and others gather large amounts of data and base decisions on that data. Assuring that those data are accurate, attributable, retrievable, and understandable requires specific measures related to security and quality control. Recent trends in data sharing among researchers support better use of research funding and

greater possibilities of reproducing scientific findings under various conditions. The issues for researchers, businesses, regulators, and others reacting to the products of recorded data have important effects on developments in business and scientific knowledge.

*Issues in the scientific enterprise.* Science relies on data to advance knowledge and support the infrastructure for decision making. To accomplish these goals, the scientific method consists of several specific steps implemented in a logical and systematic way. Scientists observe and ask questions about their observations; design a research project around a testable question or hypothesis; collect and record observations (data); analyze and draw conclusions from their data; and replicate the process and/or publish their findings. Data emerging from a scientific query must be recorded contemporaneously and stored for later analysis. Threats to data integrity can occur at any point in the implementation of the scientific method, as well as arising from outside forces. Those threats are managed by quality control of all aspects of the research and data security policies to mitigate outside risks.

Most data today are stored on computers, although in conducting research, humans may make observations and record those in one location; transfer that data into a computer storage system; and finally interact with the data in other locations once it has been stored. Data entry is one process where integrity can be compromised by human error, such as transposing numbers, entering data in the wrong location, or intentional falsification or fabrication of data. Technology has provided many advances to minimize those risks, including direct capture of data from an electronic laboratory notebook or an electronic health record. This reduces copying errors and intentional misconduct. However, data are still manipulated by users, for example, to perform statistical analyses, which may take place with a downloaded file copied onto another computer. The transfer of data and opportunities to modify the data create risk to data integrity. Additionally, copies of data housed on other computers can cause confusion if there is no way to identify the primary file or version number. Electronic solutions exist for such problems, and institutional

policies and procedures must provide for protocols to manage these threats (e.g., removing duplicate files, backing up primary data, maintaining vigilance with an automatic electronic audit trail). An overarching consideration is the security of the data and the protocols that protect these processes. All are required to ensure that data are uncorrupted and thus valid and reliable.

*Issues for business and corporations.* Operational decisions for a well-managed corporation or business are based on reliable data. Companies spend a great deal of money on data collection and security, partly to safeguard intellectual property, but good data security also ensures operational efficiency. Reliable financial data form the basis for investment and management of company funds; robust marketing data drive sale campaigns. Corporate management cannot function well without reliable data, and data management is more complex when it involves a supply chain for materials outside the control of the company, such as in manufacturing. Multinational pharmaceutical or medical device companies that develop or manufacture drugs or devices face challenges trying to maintain quality control over their processes outside the jurisdiction of the company headquarters. Part of the data integrity issue is the reliability of the supply chain supporting these manufacturing plants. National regulations for drug approvals require evidence from quality assurance processes and, increasingly, verification by inspections (Shanley 2016). Data integrity problems involving medical drug and device supplies can create a public health crisis if that problem results in defective products or compromised research. China's State Drug Authority recently fined a vaccine manufacturer \$1.3 billion for falsifying data on the production of a rabies vaccine used in children (Hargreaves 2018). Unreliable manufacturing of drugs can cause harm to patients using such drugs. For some businesses like financial institutions that collect sensitive and confidential data, the greatest threat is data theft from internal or external breaches of electronic security measures.

*Issues in publication ethics.* Questions about published research come from peer reviewers, editors, readers, granting agencies, other authors,

journalists, and regulators. An accurate response to some of those questions can require a review of the data underlying the research. Journal publishers and editors do not have control over the data underlying a submitted manuscript, and they must rely on the authors to supply the data on request. The classification of data for the COPE Case Taxonomy (2013) includes ethical issues related to “data, results, materials, and also submission/publication-associated documents, e.g. consent and copyright forms.” Data integrity specifically includes falsification or fabrication of data and mistakes or problems leading to data problems consistent with the COPE Taxonomy. According to the Retraction Watch Database (<https://retractionwatch.com/retraction-watch-database-user-guide/>), corrections and retractions have been issued in response to honest errors in materials used, contaminated reagents, and other defective products. Permission to use data owned by another researcher or institution must also be properly documented; it is considered unethical to use data owned by another individual without full permission.

## (Managing) Diversity

Hans van Dijk

Department of Organization Studies, Tilburg University, Tilburg, The Netherlands

## Synonyms

Dissimilarity; Heterogeneity

## Definition

The division of the workforce into distinct categories that (a) have a perceived commonality within a given cultural or national context and that (b) impact potentially harmful or beneficial employment outcomes such as job opportunities, treatment in the workplace, and promotion prospects – irrespective of job-related skills and qualifications (Mor Barak 2014, p. 136).

## Description

Organizations have become more diverse over the past decades, among others, due to globalization and women entering the labor force. The increasing reliance on teamwork and loosening of hierarchical boundaries have further created an increase in the extent to which individuals who differ from each other work together. Another main impetus for diversity in organizations was the Civil Rights Act of 1964 in the USA, which prohibited all employment practices that discriminated on the basis of race, color, religion, sex, or national origin (age and disability were added later). Subsequent equal employment opportunity (EEO) and affirmative action (AA) policies and programs led to a gradual increase of minorities in organizations and, hence, an increase in diversity (Kochan et al. 2003).

In spite of the increasing representation of minorities in the workforce, over time, a number of unintended consequences of the anti-discrimination policies and programs became

apparent. There was an increase in immigration from developing countries, beneficiaries of AA policies faced backlash effects, and in particular, in times of job insecurity, there was a strong opposition from anti-affirmative action groups (Graham 1998). Lawsuits involving reverse discrimination pointed at the shortcomings of EEO and AA policies and initiated their decline in the 1990s. In face of these shortcomings, companies, and diversity consultants shifted their rhetoric on diversity by developing a business case rationale that emphasized how diversity could be of value to the organization (Kelly and Dobbin 1998). International companies soon adopted the business case rationale and caused it to spread across the globe (Lorbiecki and Jack 2000), resulting in the adagium in organizations as well as the popular press nowadays that diversity enhances organizational performance (Eagly 2016).

## Main Perspectives

With its focus on the positive consequences, the *business case perspective* is clearly grounded in utilitarianism (van Dijk et al. 2012a). Specifically, the business case perspective suggests that diversity adds value to organizations in a number of ways (Kochan et al. 2003; Lorbiecki and Jack 2000). First, diversity has been argued to lower the likelihood of litigation due to accusations of discrimination. Second, diversity is expected to increase customer understanding and access to customers. Third, diversity is suggested to enlarge the talent pool and enhance the extent to which the full capabilities of all employees are used. These three arguments have been readily accepted. However, the final and fourth business case argument for diversity is the most crucial, as well as the most debated. It suggests that diversity improves performance because diversity is supposed to provide a richer pool of knowledge, information, and perspectives (Ely and Thomas 2001; van Knippenberg et al. 2004). Although numerous studies have aimed to validate the claim that diversity enhances performance, several recent meta-analyses (e.g., Pletzer et al. 2015; Post and Byron 2015; van Dijk et al. 2012b; see

also Rhode and Packel 2014) show mixed findings.

An important reason why research on the relationship between diversity and performance is inconclusive is that the exact process of how diversity affects performance is unclear. Whereas prior studies suggested that diversity can positively affect performance when diverse employees are able to discuss and integrate their knowledge, information, and perspectives (van Knippenberg et al. 2004), more recent studies suggest that the main benefit of diversity may lie in cuing employees that varied knowledge, information, and perspectives may be present (Loyd et al. 2013; Srikanth et al. 2016) and in coordination benefits by indicating whom is an expert (van Dijk et al. 2017). Further, diversity is known to negatively affect performance when the differences create divides and causes conflicts between employees, which inhibit the extent to which members' collaborate and discuss and integrate task-relevant information (van Knippenberg et al. 2004). Research on the exact processes and determinants of how and when diversity positively affects performance thus is ongoing (for a recent review, see van Dijk et al. 2017), and it may take a while before more conclusive statements can be made.

A large number of scholars have criticized the instrumental take of the business case perspective on diversity (e.g., Noon 2007; Zanoni et al. 2010). Based on the deontological argument that no individuals ought to be treated merely as a means, they pointed out that the business case perspective does not celebrate diversity in itself, but only if and as long as it adds value to an organization (van Dijk et al. 2012a). In light of the mixed findings regarding the relationship between diversity and performance, the business case perspective indeed suggests that organizations are better off excluding minorities in situations where diversity negatively affects performance. By indicating that power inequalities continue to exist in societies and organizations that create discrimination and exclusion in organizations (Plaut 2010), these scholars promote an *equality perspective* that contends that organizations should pursue diversity to empower minority groups and alleviate

inequalities (Noon 2007). There is among proponents of the equality perspective some debate about how equality in organizations can best be created, but the equality perspective in general suggests that EEO and AA programs are still needed. Specific examples of more accepted measures toward equality are transparent recruitment practices, flexible work arrangements, and alternative career paths (Benschop and Verloo 2011). An example of a more radical measure to alleviate inequality is the installment of quota, such as Norway's law that requires at least 40% women on the board of public limited companies. Whereas such gender quotas have been effective in increasing women's representation, they are contested for a number of reasons, including that they presumably discriminate against men, can stigmatize quota beneficiaries (and potentially women at large), and may decrease performance (Leslie et al. 2014).

Although the business case perspective and the equality perspective essentially thus both plea for more diversity, there are some marked differences between the two (van Dijk et al. 2012a). First, the business case perspective addresses diversity from the perspective of the organization and therefore arrives at recommendations that mainly promote the interests of the organization. The business case perspective thus tends to be more considerate toward outcomes that are favorable for organizations in comparison to outcomes that are favorable for individuals. In comparison, the equality perspective approaches diversity from the perspective of the individual employee and asks what would serve individuals' interests based on fundamental human rights. As such, the equality perspective tends to promote the interests of the individual over that of organizations. Second, the utilitarian nature of the business case perspective provides a contingent argument (Noon 2007), meaning that diversity should only be pursued when it adds value to the organization. In contrast, the equality perspective provides a deontological argument by suggesting that it may be necessary to recruit, select, or promote minorities, *regardless* of the consequences for the organization.

## Managing Diversity: A Focus on Inclusion

In theory, the business case perspective and the equality perspective are difficult to reconcile due to their contrasting moral underpinnings (van Dijk et al. 2012a). However, because both perspectives favor diversity, organizations tend to draw from both perspectives, such that most diversity management practices represent a blend of both perspectives by promoting diversity for disparate reasons (Pendry et al. 2007; Tomlinson and Schwabenland 2010). A risk here is that the inconsistent arguments backfire and either lead to a disbelief in the value of diversity or inhibit an integration of minorities into an organization. In fact, there are several examples where diversity management practices aimed to foster intergroup relations between minorities and majorities but created opposite effects by enhancing stereotyping, prejudice, and discrimination (Leslie et al. 2014; Pendry et al. 2007).

Accordingly, managing diversity appears to be a daunting task. A number of studies on *inclusion* (e.g., Mor Barak et al. 2016; Nishii 2013; Pless and Maak 2004; Shore et al. 2011) however suggest that creating an inclusive climate improves intergroup relations and may, in part as a consequence, also positively affect individual- and group-level outcomes. Inclusion refers to "the degree to which an employee perceives that he or she is an esteemed member of the work group through experiencing treatment that satisfies his or her needs for belongingness and uniqueness" (Shore et al. 2011, p. 1265). Accordingly, a *climate for inclusion* is an environment where all employees are treated fairly, are valued for who they are, and are included in the decision-making (Nishii 2013). Initial studies show positive relationships between inclusive climates and various positive outcomes at the individual (Mor Barak et al. 2016) as well the group level (Nishii 2013) and therefore presents a way forward for the business case perspective as well as the equality perspective (for recent reviews, see Dwertmann et al. 2016; McKay and Avery 2015). That leadership plays a pivotal role in creating and sustaining

inclusive climates is axiomatic (Shore et al. 2011), but how leaders can and should go about doing that remains to be studied (Nishii and Mayer 2009).

## Market Failures Approach to Business Ethics

Carson Young  
SUNY Brockport, Brockport, NY, USA

### Synonyms

The implicit morality of the market

### Introduction

The Market Failures Approach to business ethics (hereafter “MFA”) is a theory of business ethics that attempts to derive ethical prescriptions for market actors from an understanding of the purpose of markets. The MFA follows conventional welfare economics in understanding the main purpose of markets to be the achievement of Pareto efficiency. When markets are functioning well – when they are not failing – market actors’ pursuit of profit is an important mechanism that pushes markets toward Pareto efficiency. The MFA holds that this kind of profit-seeking behavior is morally justified. However, when market failures are present (e.g., externalities, information asymmetries, market power), market actors’ pursuit of profit can inhibit the achievement of Pareto efficiency. According to the MFA, tactics for pursuing profit that create or exacerbate market failure are morally impermissible.

### A Paretian Theory of Business Ethics

The MFA was developed by Joseph Heath (see especially Heath 2014), though with significant

similarity, and intellectual debt, to Christopher McMahon’s earlier work on the “implicit morality” of the market (McMahon 1981).

Some philosophers and political theorists conceive of markets as ethics-free zones, where selfish actors, unconstrained by morality, try to maximize their own gains. Both McMahon and Heath argue against understanding markets as zones of amorality: rather, properly understood, markets are institutions with an internal moral logic of their own. The MFA is an attempt to explicate the market’s “internal” morality.

### Pareto Improvement and Pareto Efficiency

The MFA’s conception of the market relies heavily on the conventional theory of welfare economics (see entry ► “Welfare Economics”). Thus, understanding the MFA requires understanding some fundamental concepts that welfare economics uses to compare distributions of goods or resources across populations of individuals: *Pareto improvement* and *Pareto efficiency* (the latter of which is also sometimes labeled “Pareto optimality”).

A distributive state  $y$  represents a *Pareto improvement* over another distributive state  $z$  if and only if at least one person is better off in  $y$  than in  $z$ , and nobody is worse off in  $y$  than in  $z$ .

An assumption of conventional welfare economics, which the MFA shares, is that an important goal of the economy, and of economic institutions, is the facilitation of as many Pareto-improving transactions as possible. The basic intuition behind this assumption is that if we have a way to make someone better off without making anyone else worse off, then we should do so.

Voluntary market exchanges are typically Pareto improvements. Suppose that Joe has many apples but no oranges, while Chris has many oranges but no apples. Both Joe and Chris want to diversify their diets. Joe agrees to accept some of Chris’s oranges in exchange for some of his apples, and Chris agrees to accept some of Joe’s apples in exchange for his oranges. Assuming that Joe and Chris are both rational, self-interested actors (at least when engaging in market transactions), this exchange will leave them both better off. Nobody has been made worse off, so

the transaction qualifies as a Pareto improvement. When market economic institutions are functioning well, they efficiently facilitate this sort of mutually beneficial, Pareto-improving transaction.

A *Pareto efficient* (or *Pareto optimal*) state obtains when the distribution of goods and resources in the economy does not allow for any further Pareto improvements. In other words, a state is Pareto efficient when nobody can be made better off without making someone else worse off, because all potential Pareto-improving transactions have already occurred. An efficient economy is an economy that exhausts all potential Pareto improvements.

The MFA follows conventional welfare economics in identifying Pareto efficiency as the telos of the market economy. McMahon (1981, 255) identifies the implicit morality of the market as the conditions that must obtain for the market to achieve Pareto efficiency; Heath (2013, 50–51), for his part, states that the “major claim” of the MFA “is that the point of marketplace competition is to promote Pareto efficiency, and in cases where the explicit rules governing the competition are insufficient to secure the class of favoured outcomes, economic actors should respect the spirit of these rules and refrain from pursuing strategies that run contrary to the point of the competition.”

### Market Failure

The link between these technical Paretian concepts from economics, on the one hand, and market failure, on the other, is that market failure is defined as a failure of the market to reach a Pareto-efficient state. Common examples of market failure include negative externalities and information asymmetries. The presence of these prevents the market from achieving Pareto efficiency.

A *negative externality* occurs when a market transaction imposes a cost on third parties who are not themselves directly involved in the transaction. Suppose I agree to sell you widgets I produce in my factory at price  $p$ . My factory creates toxic sludge as a byproduct of widget production. Proper disposal of this sludge is expensive. If I, the factory owner, had to pay to dispose the

sludge, I would be forced to sell widgets to you at the higher price  $p + \text{disposal fees}$ . But I am able to avoid these costs by diverting the toxic sludge into a river that runs alongside the property on which my factory is located (see entry ► [“Economics, Ethics, and the Environment”](#)).

As mentioned above, voluntary market exchanges typically represent Pareto improvements because they are mutually beneficial – if a market exchange is not mutually beneficial, it will be in the interest of at least one of the involved parties to decline the transaction. However, when a negative externality is present, third parties who are harmed by the transaction cannot stop it, because their assent is not required for the transaction to occur. Even though we can expect my agreeing to sell you widgets at price  $p$  rather than  $p + \text{disposal fees}$  to benefit both you and me, we cannot expect the transaction to qualify as a Pareto improvement because of the potential harm third parties will face associated with my disposing of toxic sludge in the river. This negative externality is thus an example of a market failure: when present, we are no longer justified in assuming that voluntary market exchanges will be represent Pareto improvements that move the economy closer to Pareto efficiency.

An *information asymmetry* occurs when one party to a transaction has more information about the good or resource being exchanged than other parties. Absent market failure, when two people mutually agree to exchange a car for money, we assume that both are better off – otherwise why would they assent to the deal? Suppose, however, that the seller of the car knows that its engine is about to give out, necessitating expensive repairs. The buyer does not know this, and cannot discover it. (Suppose that the problem with the car is not one that could be identified easily through a test drive or a routine inspection.) When the buyer and seller agree to exchange the car for money, the buyer is made worse off: she would not have agreed to buy the car for so high a price if she had known the extent of its mechanical problems. Thus, when information asymmetries are present, we are not justified in assuming that a voluntary exchange will be a Pareto improvement.

### Market Failure and Ethical Business

Given the MFA's reliance on the concepts of Pareto improvement and Pareto efficiency, one might expect the MFA to hold that ethical business requires refraining from acts that are not Pareto improvements. This, however, is not the correct way to interpret the MFA: the sort of competitive behavior that pushes markets closer to Pareto efficiency frequently involves individual acts that are not themselves Pareto improving, because they make at least one actor worse off. For example, when a firm competes away some of a rival firm's customers by offering a superior product, it sets back the rival firm's interests. Yet pursuing profit by offering better products than one's rivals is precisely the sort of competitive behavior the MFA endorses. So the MFA cannot be reduced to the direct application of a Pareto improvement standard.

The Paretian principles at the foundation of the MFA, rather than being directly action guiding, apply more broadly to market institutions, of which individual ethical constrain on the part of market actors is but one component. Deriving the practical ethical implications of the Paretian principles thus requires understanding how market institutions promote Pareto efficiency.

In short, then, the connection between market failure and the MFA's conception of ethical, responsible business is: when markets are functioning well – that is, when market failure is not present – market participants' competitive pursuit of profit pushes the market toward closer to a Pareto-efficient outcome. This, essentially, is the MFA's justification of profit-seeking. However, in the presence of market failure, market participants' competitive pursuit of profit typically will not contribute to Pareto efficiency.<sup>1</sup>

Indeed, when market failures are present, market participants' competitive pursuit of profit can impede the efficient functioning of the market: think of the manufacturing company that is able

to avoid costs associated with the pollution it produces by imposing them on third parties (negative externality), or of the used car dealer who is able to convince some buyers to overpay for cars with hidden mechanical problems due to an information asymmetry. If the manufacturer or the used car dealer try to maximize the profit they derive from exploiting these market failures, they are likely to exacerbate the market failures and cause the market to perform even less efficiently than if they had not been attempting to maximize profit.

Thus, according to the MFA, the main ethical responsibility of the manager of a for-profit business firm is to avoid pursuing profit in ways that exacerbate market failure.

What this responsibility entails in practice, however, is not clear. In an early chapter, Heath (2004, 84) provides a list of ten specific imperatives that the MFA entails: for example, "Minimize negative externalities," "Compete only through price and quality." However, in the same chapter, and in more recent work (see Heath 2014), he backs away from these specific imperatives because of complications arising from the economic theory of the second best (Lipsey and Lancaster 1956). According to the theory of the second best, when multiple market failures are present, reducing a single market failure (e.g., by minimizing one negative externality) will not necessarily move the market closer to Pareto efficiency.

Therefore, the practical implications of the MFA remain somewhat unclear. Because of complications associated with the theory of the second best, and because individual market actors generally lack the knowledge necessary to know either (a) whether a market failure is present or (b) what actions would be necessary in order to avoid profiting in a way that exacerbates the market failure, determining what the MFA requires of specific market participants in the real world is difficult (Steinberg 2017). It is unclear to what extent theorists can derive general prescriptions from the MFA in a way that elides this problem (see Moriarty 2020).

### The Appeal of the MFA

Given this problem, one might wonder what some business ethicists find appealing about the MFA.

<sup>1</sup>"Typically" is used here because economic theory does not allow us to derive definitive predictions about the effect of a market actor attempting to maximize profit when in the presence of market failure; see Lipsey and Lancaster (1956).

First, the MFA can be understood as part of a broader intellectual project that attempts to unify the main principles of business ethics with the principles that justify the legal, economic, and political institutions that facilitate business activity. Traditionally, a popular methodology for business ethics is to take a comprehensive moral theory – for instance, utilitarianism, Kantian deontology, or Aristotelean virtue ethics – and to apply that theory to ethical questions in the domain of business. Recently, some business ethicists have advocated a different methodology that relies more on political theory and political philosophy than on moral philosophy. These scholars argue that a good theory of business ethics should cohere with the theories we use to justify, or criticize, the legal, economic, and political institutions that make up the market and regulatory environment in which business activity takes place (Heath et al. 2010; Norman 2011; Singer 2018). The MFA belongs in this family of theories of business ethics because it tries to specify the ethical duties of managers in relation to a conception of what justifies the competitive market system more broadly: for Heath and McMahon, the achievement of Pareto efficiency. As a result, the MFA takes the nature of the institutional environment of business seriously in a way that moral philosophy approaches do not (see entries ► [“Political Philosophy and Business Ethics”](#) and ► [“Role of Philosophy in Business Ethics”](#)).

Second, and relatedly, the MFA is compatible with capitalism (see entry ► [“Capitalism”](#)) in a way that some other popular theories in business ethics arguably are not. (Of course, whether this counts as a point in favor of the MFA will depend one’s beliefs about the justifiability of capitalist institutions.) Some approaches to business ethics seem to conceive of ethical business as primarily about curtailing the profit motive (see Heath’s 2006 critique of stakeholder theory). The MFA, by contrast, understands the profit motive as a vital component of ethical business, since actors pursuing profit in competitive markets is a fundamental mechanism on which economic institutions rely to further the

goal of attaining Pareto efficiency. The MFA does not, of course, endorse all instances of profit-seeking: it identifies unethical profit-seeking as being connected to the exacerbation of market failure. This orientation potentially allows the MFA to distinguish between ethical and unethical ways of pursuing profit in a market in a way that many rival approaches that are more hostile to the profit motive arguably cannot.

Third, though the MFA defends some forms of profit-seeking as paradigmatic instances of ethical business, part of its appeal is that it does this in a more nuanced, plausible way than older business ethics theories that take a more favorable stance toward the profit motive. Conventional versions of shareholder theory, for example, rely heavily on managers’ fiduciary duty to run the firm in the interest of shareholders as a justification for why shareholder value maximization should be the main ethical criterion by which managers’ decisions ought to be evaluated (see entry ► [“Social Responsibility and Business: The Milton Friedman Position”](#)). It is not clear, however, that fiduciary duty can justify such a strong obligation on the part of managers to maximize shareholder value. One problem is that popular versions of conventional shareholder theory seem to violate what Goodpaster (1991) calls the “*nemo dat*” principle: roughly, the idea that managers cannot be obligated to promote shareholders’ interests by means that would be unethical for shareholders to employ if they were acting on their own behalf. By providing a more nuanced way of distinguishing between permissible and impermissible ways of pursuing profit, the MFA may be able to avoid some of the (for many people unacceptable) implications of more extreme shareholder primacy approaches, while also preserving an important place for shareholder-oriented pursuit of profit in our ethical theory of business.

### Criticisms

One strand of criticism of the MFA, discussed above, asserts that, because of problems related to the economic theory of the second-best, the

MFA cannot provide guidance applicable to actors in the real world, which is beset by second-best problems.

Another prominent strand of criticism of the MFA objects to the MFA's reliance on economic values to the exclusion of noneconomic values. Heath writes that the "efficiency imperatives" to which market actors must adhere for the market to realize Pareto efficiency "are pretty much all there is to business ethics, at least with respect to market transactions" (Heath 2014, 174). Interpreted as a comprehensive theory of business ethics, the MFA leaves no place for seemingly important moral considerations such as the duty not to harm, the duty to support just background political and economic institutions, duties to promote and respect noneconomic environmental values, and duties arising from the failure of the political and economic institutions of society to ensure justice.

There are at least two kinds of response to this line of criticism available to defenders of the MFA.

First, while acknowledging the importance of noneconomic moral considerations, the MFA defender could argue that these considerations have little direct relevance for how market participants should act. Such a response would likely rely on the notion that there should be a division of moral labor between a society's various political, legal, and economic institutions. We might assign the economic institutions that constitute competitive markets and profit-oriented business the task of promoting economic efficiency and growth, while assigning responsibility for politically and ethically important noneconomic goals to other institutions (e.g., legislatures, administrative agencies, courts, and nonprofits). According to such a view, although economic considerations do not encompass all that is of moral importance, they do capture all, or nearly all, of what is relevant to the norms governing profit-seeking market actors.

The second response available to defenders of the MFA is to depart from Heath in viewing the MFA as a comprehensive theory of business ethics. Such a view could identify economic

efficiency considerations as especially important for understanding the main ethical responsibilities of profit-seeking market actors, but would hold that economic efficiency considerations alone cannot ground an exhaustive account of market actors' ethical responsibilities.

One potential drawback of this response is that it weakens the MFA's prescriptive force: if the MFA only captures part of what matters morally for assessing and prescribing market actors' conduct, then the MFA's prescriptive guidance will only hold when all else is equal, and could be overridden by countervailing considerations that are not contained within the MFA itself. On the other hand, however, perhaps this is the right amount of prescriptive force for the MFA to have. Most ethicists do not believe that the moral considerations of economic efficiency and welfare upon which the MFA relies can adequately account for all of business ethics, or even just for the narrower sub-domain of business ethics that directly concerns market transactions.

## Marketization of Higher Education: Ethical and Societal Dilemmas

Frederick A. Ricci  
Georgetown University, Washington, DC, USA

### Synonyms

Exposure of higher education to market forces

### Introduction

As higher educational institutions continue to become more competitive, administrators are expanding their market-oriented strategies with new communications on social media. In this venue, information resources have grown beyond anyone's expectations. Such risk-taking approaches to entice students to select the right institution compel college administrators to face ethical dilemmas in higher education marketing

practices used to recruit and retain students. The glittering visions of images and promises of innovative quality education and career success that were evident previously within print media now reside in social media, the latter of which is now the preferred information route for prospective students. In becoming aware of current practices and their ethical implications, one can bypass such glittering marketing campaigns among universities and focus on what is best for the consumer – the student.

### Marketization Practices in Higher Education

Increased competition globally has guided higher education toward becoming increasingly reliant on marketing strategies, branding, and position target marketing. Many schools are focusing on digital marketing strategies, social media, and other mobile platforms, while others have turned to marketing automation companies to assist with their marketing prospects utilizing such companies as HubSpot or Marketo, known in the marketing automation field of education. Critically analyzing these practices during this increasing competitive marketplace remains a service to the institution and should not convert the mission of all institutions to one type of educational consumer.

To get at the ethical issues involved, it is necessary to identify and explore current practices. This manuscript identifies such strategies. As these innovative strategies are critically analyzed and reviewed, ethical dilemmas become apparent, where the main objective becomes recruiting but overlooks misrepresentation scenarios. Several ethically troublesome areas of claims by the institutions are evident in offerings of free tuition, guaranteed employment, accelerated degree times, and easy enrollment. One can hope that the values of the institution marketing educators reflect the values of the institutions they represent.

### Social Media, Interactive Communications

The global social media world has created new challenges in seeking sophisticated new strategies

to attract students to universities and colleges. In our digital society, it is no longer efficient to snail mail updated catalogs and mailings with new curricula and academic pictures. Prospective and enrolled students are products of the online era and depend on the Internet and social media as a primary information source. Universities have realized that the traditional brochures, flyers, catalogs, and magazines are the dinosaurs of communication when reaching prospective students in higher education. Although traditional media such as radio, television, transit advertising, and print media are still used, the trend continues to surge toward new information multimedia techniques and devices.

The Internet will continue to revolutionize the world of higher education. Some of the best practices identified by higher marketing strategists focus on YouTube, Twitter, Snapchat, Instagram, Facebook, and platforms that disseminate information on campus events, provide virtual visits on campus life, show in-class video clips, and inform locals about campus events. Although students seek different areas of inquiries when using social media or social networking, their one focus appears on how much they relate to the school from its students, values, community, professors, familiarity, and, most important, their comfort levels.

Future students are seeking information on what the college has to offer *specifically to them* through social media and social networking. Older students are interested in the college programs of instruction, the styles of pedagogies, and the delivery whether totally online, face-to-face, or in blended learning classes. Today's prospective students want to learn about the college and understand the environment by reading, listening, or speaking with other students, friends, and advisors in the college admissions office, which specifically focus on the individual student. In reviewing the changing marketization of higher education, we question the ethical approach of the marketing and enrollment management organizations, especially those from colleges with low enrollments and several professional, technical, and career-focused postsecondary for-profit educational institutions.

The United States Department of Education's action against several universities resolved the Department's claim that institutions used unsubstantiated job placement claims in its recruitment and marketing materials (Congresswoman Maxine Waters [n.d.](#)). Ethical behaviors of institutions of higher education are being challenged in some of their marketing techniques used to recruit and retain students.

### Time for Change

Now is the time of change for higher education marketing. Charlotte Fenney, Head of Education Marketing, Euro RSCG Heists, an education marketing agency in England, again emphasizes that it is a good time to expand the higher education brand internationally and tailor campaigns to international markets segmenting by country, study level, and discipline (The Guardian [2018](#)). Monica Romeri's post on the 12 Content Marketing Best Practices for Schools and Colleges identified and focused on the areas most important in today's marketing strategies and policies. Romeri indicated the importance of a clear marketing plan understood, agreed to, and followed by the entire university. She emphasized a variety of communication techniques with varieties of content, blog postings, webinars, newsletters, videos, and infographics paralleling and focusing on the message colleges are conveying to the prospective applicants (Romeri [2016](#)).

### Targeting Social Media

Social media should be a prime target within the marketing strategy, for it is one of the most relevant channels of communication to those selecting a higher education institution. Most colleges now have official accounts such as Facebook, Twitter, and Instagram, all which provide up-to-date ongoing activities at the university campus and encourage present and prospective students to register for updated information. As indicated, the level of sophistication of social marketing activities has improved noticeably toward reaching prospective students. Marketing professionals know that students are

looking for experiences that should be conveyed within the focused media channels. The marketing strategy should target on what makes the college special and how it will fulfill one's educational needs.

All e-marketing should emphasize the unique value of the college among all media. The communication should also be engaging and provide informational resources that are engaging, attract attention and interest, and provide relevant content and updates on social life at the college. The content should provide an opportunity for the prospective student to pursue action by being able to request timely information through student or instructor online chats that respond to questions arousing their interest and desire to learn more about the university as well as to build a relationship and encourage them to complete an application. Romeri (2016) emphasized that the goals for these online college sites be measurable with specific objectives and should include tabulating number of viewers, social interactions, and "hits" on Facebook, Tweets, and so on (The Guardian 2018).

College selection is stressful to both students and parents. To assist the college selection process, colleges should identify and focus on their strengths. Students and parents are seeking information and often create checklists on topics that include *location, reputation, campus size, classroom sizes, degree offerings, majors, graduate rates, financial packages, tuition and fees, academic and nonacademic facilities, renowned professors, satisfied students, friends or relatives attending, and academic rank*. A marketing plan should incorporate and focus on all those strengths the college or university can provide to the prospective student (Romeri 2016).

Students are now being advised to seek a college with programs that may help with lifelong skills, self-awareness, and self-leadership: "Coursework, professors and other college programs that speak to a student's ethical intuition make up the educational gold that is enduring" (Leiken 2016). My academic research and experiences conclude that a student should seek a college that focuses on competencies in leadership and critical thinking skills and abilities.

These traits have been identified as one of the topmost desired ones by executives, government, and educators (Ricci 2013).

### Global Competition and Rankings

Contrary to what many academicians wish to believe, rankings do count during the decision-making process. Many colleges have a full-time staff reviewing the worldwide rankings and adapting to how the rankings were derived. Students are constantly looking at ranking listings for the best undergraduate schools, graduate schools, and professional schools, as well as profiles in print and what students say online about different universities. Several web-based news publications rank colleges according to such factors as region, state, country, area of interest, majors, and cost. Magazines and newspapers such as *U. S. News and World Report*, *Consumer Reports*, *The Economist*, *Business Week*, and other career-oriented publications find it profitable to rank universities and colleges. Each year their ranking college editions are one of their most popular publications.

### The Final Selection Process

How does a student choose a college or professional school? Often, students still make decisions based on their hearts rather than on their research. They may be influenced by peers, social media, advertising, and prestige or name recognition. Most often they are influenced by their parents, teachers, friends, and career counselors. Some marketing strategists recruit ambassadors and mentors for those who are seeking advice for their higher education selections. Once again, social media leads as the communications of choice; therefore, decisions are often made based on social input. Ideas and images will continue to be exchanged freely on such sites as Twitter, Facebook, and LinkedIn. At present, these sites continue to show the most promise in assisting the decision-makers and prospective students. The way in which universities and colleges are reaching their potential students will continue to evolve and prosper. This user-friendly interactive environment will endure and provide a gateway to reach most prospective students throughout the world.

In “The Future of Promotional Marketing in Higher Education,” George Dehne (n.d.) discusses his vision that colleges will develop highly visible services for all those who influence students in their decisions. Colleges will position rather than produce mass publicity programs. Word-of-mouth marketing will significantly increase through technology, social media, and one-to-one marketing programs. Dehne indicates that alumni, who are a credible low-cost resource, will play a larger role in prompting the institution and in student recruitment. Later, Dehne indicates that the most successful marketing approach will involve a critical mass of alumni and parents of alumni, which have been proven to be effective players in marketing and public relations.

Testimonials will be provided through the home page. Such testimonials will come from alumni holding a variety of careers as well as highly visible administrators and executives. Testimonials will be provided from local, national, and global levels within the college community through search engines and entering the “front door” of the institution. Most interestingly, Dehne (n.d.) indicates that interactive marketing will need to reflect the “generation’s visual acuity, sophisticated taste in media, and insatiable appetite for entertainment.”

### **Customization on Marketing Strategies: “Give the Customer What One Wants”**

Customization will be the focus based on the potential student’s interests for undergraduate, graduate, and adult education students. Case studies and stories with photos of the adaptation of those who successfully returned and completed degree and certificate programs are examples of customizing the marketing campaign while identifying strengths and focusing on goals of the adult and the ability to fulfill those needs. The future of marketization in education will be demanding and require innovation and creativity. Marketing will be more personalized, and colleges will work to seek agency partners as marketing media continues to expand.

Will colleges focus on social media and targeted marketing and continue to surge into the new world of internet marketing and communications in higher education? On reading the new marketing strategies, we hope that the future of marketization in education will be challenging, dynamic, creative, and give strength to those universities that can coordinate communication efforts toward expanding critical thinking skills and creative innovations toward pursuing a world class education.

Social media communication has become the most effective method in reaching the masses and providing information to the largest percentage of prospective students. Higher education has evolved to mass customized marketing, which will bring the information needed to smart phones, iPads, computers, and any new mode of communication to every person worldwide. However, will social marketing expand toward attracting prospective candidates with more choices? New degrees have emerged to address the increased demand for new occupation requiring new courses of study. Some educators feel that communication technologies are changing the quality of instruction and higher education offerings due to the market-driven demand for specific programs of study courses that are shorter and less rigorous, which brings up the question: Are instructors “washing down” their courses to attract more students into their classes and become the A–B graders in the future?

The marketization and internationalization of higher education is now focused on the ratings and rankings of the university, worldwide. We question why higher education institutions are beginning to teach toward the ratings, which often changes program quality and the subsequent impact on our society and the world. One of the greatest challenges will be how higher education will provide new world views needed for the future and evaluating the competencies, skills, and abilities of their graduates. In becoming aware of current practices and their ethical implications, one should bypass the glitter of marketing campaigns among universities and focus on what is best for the consumer – the student. Once again although social media will continue to be the

media choice for marketing of higher education, the success of the campaigns will be the outcome of its products – college graduates. We hope that institutions of higher learning will continue to be the economic engines of a society attracting those with knowledge in providing research and innovation to our world as they contribute to our global economy.

## Synonyms

Marxism

## Definition

Karl Marx (1818–1883) was a thinker, philosopher, economist, and political theorist, who has influenced both western and eastern society profoundly. The greatest contribution of Marx is

Marxism, a total body of theory which consists of Marxist philosophy, Marxist political economics, and scientific socialism. Western Marxism, together with analytic philosophy, phenomenology, and structuralism, is considered to consist of four main streams of philosophy in the twentieth century. On the other hand, Marxism in eastern contexts, for instance, is represented by Marxism-Leninism, which has served as part of the guidance of the Communist Party of China.

Marx's representative works include three volumes of *Capital* (Das Kapital) and *The Communist Manifesto* (1848, written in cooperation with his friend, Friedrich Engels). He insists on the famous belief that philosophers have merely interpreted the world in various ways, and the point is to change it. Marx finds surplus value and the alienation of the workers in a capitalism economy, which contributes to the theory of labor value. Furthermore, Marx argued that human society develops by way of a class struggle and so explored a new system: socialism. Last but not least, the formation of Marx' thought is a process. He not only transformed from idealism to materialism but also changed from being a revolutionary democrat to being a communist from 1841 to 1843.

## Biography

Marx (1818–1883) was born into a Jewish family in Trier. His birthplace witnessed the identity of its people being transformed, in 1814, from free citizens into subjects of the Prussian King. Marx's father, Heinrich Marx (1782–1838), was a lawyer who changed his religion in order to work as a civil servant. He believed in natural religion, as did Newton, Locke, and Leibniz, and played a role in the political liberalism of Prussia. Heinrich won the respect and love of his son, Marx, throughout his life. Marx spent his boyhood in Trier and lived in Germany, France, Belgium, and the United Kingdom. He married Jenny von Westphalen in 1843 and they had seven children. After 1845, Marx became stateless when he was expelled from Paris due to the fact that Prussia put pressure on France.

Between 1818 and 1836, the young Marx was not only affected by liberalism but also influenced by utopian socialism. The impact of liberalism comes from Hugo Wyttenbach, his history teacher in secondary school. And the influence of utopian socialism is from Henri de Saint-Simon, his father-in-law in the near future. After leaving school, Marx attended the University of Bonn and majored in law for 1 year and then moved to the University of Berlin, one of the best universities in the world for law and philosophy, at the request of his father. After graduating from the University of Berlin, Marx successfully submitted his PhD dissertation to the University of Jena. The Marx' submitted choice of universities was determined by the different attitudes toward the Young Hegelians of the University of Berlin and University of Jena. In other words, the former university challenges the Young Hegelians, and the latter university appreciates the Young Hegelians. Marx then lived in Paris from 1843 to 1845, Brussels from 1845 to 1848, Cologne from 1848 to 1849, and London from 1850 until his death in 1883. Marx's friend, Friedrich Engels, not only sponsored Marx during his life but also cooperated with Marx to found Marxism.

## Masterpieces

Marx writes a large quantity of notes as well as manuscripts, which were edited and published by his friend, Friedrich Engels. He is considered an economist due to his economic work, *Capital*, which discusses communities, surplus value, and the roots of the capital economic crisis. He is also regarded as a political theorist for his political work *The Communist Manifesto*, which guided the international communist movements. Marx was a philosopher who was concerned about the benefits of people worldwide, as revealed by his *Economic and Philosophical Manuscripts of 1844*. The thought of Marx spread via his masterpieces:

- *Capital* – This is not only regarded as the Bible of the working class but also transforms

historical materialism from assumption into a scientific theory. *Capital* consists of volume I (1867), volume II (1885, formally known as *Capital*), and volume III (1894). There are two outstanding crystallizations of Marx wisdom: in other words, surplus value and the essence of a crisis within the capitalist economy. The former refers to the idea that capitalists gather workers' excess labor outcome through absolute surplus value or relative surplus value. The latter indicates that the fundamental root of the capital crisis is the relative surplus of production. Marx's economic thought has been referenced by capital countries following the economic crisis.

- *The Communist Manifesto (1848)* – Marx and Engels cooperated to produce *The Communist Manifesto* and its later prefaces, the ultimate goal of which was the abolition of private property. *The Communist Manifesto* demonstrates the antithesis between the bourgeoisie and the proletariat, i.e., the proletariat is the gravedigger of the bourgeoisie according to a highly advanced prediction. Marx, however, approves of these positive roles of the bourgeoisie. In reality, the bourgeoisie produces equal individuals and worldwide production, consumption, and even literature. Furthermore, the bourgeoisie creates huge fortunes and a centralized social life. Even though they were an advanced class in the past, the bourgeoisie are necessarily giving way to the proletariat. The inevitable outcome of capital productivity is the birth, growth, and maturation of a proletariat who possesses nothing apart from their labor. With the unintentional help of the bourgeoisie, the struggle of the proletariat becomes centralized, conscious, joint, and gradually worldwide. Last but not least, the proletariat replaces the bourgeoisies as an absolutely necessary practical premise for the full development of productive forces. Moreover, the proletariat heralds the advent of a classless society, a new era of human society. Finally, the Communist Manifesto not only guides October Revolution in Russia (1917) but also influences establishment of

People's Republic of China (1948) to a large certain degree.

- *Economic and Philosophical Manuscripts of 1844* – These manuscripts mark Marx's original exploration of philosophy, i.e., historical materialism, which is relatively independent of Feuerbach. Marx discussed the relationship between capital and labor at the philosophical level for the first time, which is classified by researchers as the young Marx. The philosopher Marx, neither an economist or political theorist, thinks about human society at the moral and ethical level, transcending the original levels of class and party. To be specific, due to attitude change of philosophy academia, Marx had to go University of Jena to apply for his PhD degree in 1841. The suffering helped Marx to realize his potential and passion in philosophy. Actually, Marx was considered as the millennium's greatest thinker by BBC at the end of the twentieth century.

The 70-page pamphlet was written in Paris and Brussels by Marx and first published in 1932, consisting of three manuscripts. Concretely, the first manuscript talks about the wages of labor, the profit of capital, and the rent of land. It also seriously discussed the rule of capital over labor, capitalists' motives and competition, and estranged labor (alienation). The second manuscript discusses the antithesis of capital and labor. Finally, the third manuscript focuses on private property, labor, and communism.

The prominent feature of these manuscripts is alienation, which is related to private property. Alienation is used to analyze inappropriate phenomena within bourgeois society: for instance, workers lose control of their products; workers are tortured during productive activities (Anomie); workers are "separated" from their identity with freedom; the workers are seriously isolated. In short, young Marx, represented by alienation, is consulted by western researchers for solutions to social problems.

## Marxism

Victor Wallis  
Berklee College of Music, Boston, USA

## Definition

Marxism is the total body of theory that has evolved using the method developed and applied by Karl Marx (much of it in collaboration with Friedrich Engels). Its central aim is to comprehend the evolution of class relations under capitalism. The analysis is at once historical, economic, sociological, and political. But it is grounded in a philosophical observation as to the unrealized human potential of the majority in class-divided societies. Capitalism, as understood by Marx, is the first such society whose development creates the conditions in which this majority can displace the previously dominant minority (or "ruling class") and thereby introduce a society without class antagonisms.

## Marx's Method

Marxism as a body of theory needs to be understood above all in terms of the way in which Marx himself worked, taking into account his activism as well as his theoretical pursuits. Only in the light of such understanding is it possible to

meaningfully discuss the various later versions of Marxism.

Marx's earliest theoretical writings (his 1844 manuscripts) focused on the essential nature of the human species as affected by subjection to the at-that-time new regimentation entailed by factory work. In reflecting on the disjunction between inherent human potential and the hollow shells of humanity cast off by this labor process, Marx evolved his core methodological principle of viewing all dynamic phenomena – whether organisms, beings, collectivities, or institutions – as both shaping and being shaped by the larger matrix of conditions within which they have been formed. (This is the context in which Marx's oft-quoted 1859 statement, that social existence determines consciousness, needs to be understood.)

It was on the basis of this dialectical approach that Marx was able, unlike earlier political economists, to see capitalist production and circulation not just as a set of more or less "natural" mechanisms needing only to be freed of certain obstructions, but rather as the evolving outcome of a complex interplay between individual or collective agents and historically created opportunities or impositions, entailing on the one hand deliberate innovation (on a vast scale) but on the other hand a process which in its totality was beyond conscious control.

This perspective in turn made possible further insights, whether in the form of practical conclusions or of spurs to further study. Above all, capitalist institutions could be seen as historically generated and, more specifically, as the reflection of a particular set of imperatives to which each individual agent had to adapt on pain of personal ruin. The constraints could be felt at various levels, as the more proximate economic decisions were at once distinct from and yet bound up with the larger trends. Thus, measures of economic expansion that might be rational from the standpoint of the individual capitalist would, if taken simultaneously by his competitors, result in a "crisis of overproduction." The particular enterprise could fail while the broader economy suffered a cyclical downturn.

More importantly, however, the cumulative impact of such crises would be for the process to extend itself onto an ever more global canvas, with the basic growth imperative undiminished but with the stakes bringing into play a progressively more totalizing impact on human life – in the words of the *Communist Manifesto* (1848) "paving the way for more extensive and more destructive crises" and "diminishing the means whereby crises are prevented" – as subsequently exemplified in the commodification of hitherto free goods, privatization of public services, subjugation of hitherto autonomous communities, increasing vertical integration of the food production process (extending even to seeds), routine worldwide military intervention, and the general subordination of species survival requirements (ecological balance) to the drive for accumulation.

## Class Struggle

Marx's analysis of capital was at the same time an analysis of the working class. The historical novelty of capitalism lay not in commercial activity or profit-seeking as such, but rather in the forcible creation (whether by land dispossession or by conquest) of a class of people, eventually constituting a majority of the society, with no other means of survival but the sale of their labor power. Capitalist profit differed from earlier forms of surplus appropriation in that instead of being directly taken from the producers (as tax or tribute), it was extracted from them through the workings of the market. This outcome was not apparent in any single, easily discernible transaction, but could be understood only by bringing into view the entire complex of mechanisms and calculations – including of course those associated with technological innovation – within which the underlying class antagonism unfolded. This was the task undertaken by Marx in his three-volume work, *Capital* (vol. I, 1867), with his exposition of the core concepts of surplus value and exploitation. (Questions about long-term trends in these relationships have occasioned much debate, but Marx's account of the basic

drives of capital has never been seriously questioned.)

The argument of *Capital* includes extensive treatment of how the working class came into being and of how its role in production and the conditions of its livelihood are defined by capital. It is important to note that Marx's treatment recognizes the possibility of variation in any immediately observable conditions (e.g., wage levels, living standards), inasmuch as his main concern was to highlight the *tendencies* of capital. He was well aware that these tendencies could be offset by organized action (e.g., trade unions, shortening of the workday), but he also understood that the impact of such steps could in turn be counteracted by capital, whether through direct economic decisions (e.g., investing in new machinery or in a different locality) or through government measures (e.g., laws against "combinations," suppression of working-class parties, intervention in labor disputes).

It was within this framework of ongoing conflict that any more comprehensive self-awareness on the part of the working class would have to develop. Marx, from the time of his earliest writings, understood such collective self-awareness – or class consciousness – as entailing a demand not just for improvements in wages and working conditions, but for an end to capitalist rule. His grounds for affirming so radical a position were twofold. On the one hand was his sense that capital, by treating workers as ultimately disposable commodities, was denying their basic humanity. On the other hand, his analysis of the dynamics of capital showed a system essentially out of control – indifferent not only to its human subjects but also to society's *natural* infrastructure – yet kept in power through the omnipresence of its "ruling ideas" and, in the last resort, by a state in which universal suffrage, if practiced at all, is effectively circumscribed, sometimes through the use of armed force, by the interests of the dominant class.

Marx thus saw communism and working-class consciousness as closely linked, in the sense that communism, as the negation of capitalism, constitutes the implicit vantage point of a class whose members are, as human beings, themselves

negated by capitalism. Schematic accounts of Marxism typically overlook the implicitness of this connection and read into it an intent on Marx's part to impose his own views on the working class. Such a reading is belied, however, both by the historical angle from which Marx came to view the possibility of communism and also by his practical political work.

Marx differed sharply from his visionary predecessors in his refusal to "prescribe" how he would organize society. His scenario for social transformation depends at every stage on the emergence of a corresponding collective protagonist. As earlier with the development of capitalism, the process is complex; Marx's career spanned only its earliest stages, and his projections for revolutionary measures to be taken (e.g., in his *Critique of the Gotha Program*, 1875) were correspondingly cautious. Only in commenting on what had already been implemented by workers during the Paris Commune (*The Civil War in France*, 1871) did Marx venture an institutional sketch of a revolutionary social order.

As for Marx's activism, ranging from work as a radical-democratic newspaper editor in the 1840s to a leadership role in the International Workingmen's Association (IWA) (1864–1872), it showed a consistent emphasis on effective communication and open debate, as opposed to secret societies, utopian purity, and backstage power plays (see Nimtz 2000, esp. p. 229). As stated in the General Rules of the IWA (drafted by Marx), "the emancipation of the working classes must be conquered by the working classes themselves."

## From Theory to Politics

Marx was the first major political theorist to anchor his vision directly in the interests of the subjugated majority. While capitalist rule aggravated the subjugation (thereby making its supersession more compelling), it tended by the same token to strip the majority even further of its already partially stunted capacity for functioning as a ruling class. The question of how to overcome this dilemma would remain central to the Marxian project.

The agenda of working-class revolution entailed two complementary preoccupations. On the negative side, it was necessary to supplant the capitalist state and resist its efforts to reimpose itself. On the positive side, it was necessary to develop the self-organizing capacity of the working class so that it could carry out collectively the tasks of social production which were no longer carried out either by individual artisans and peasants or – with varying degrees of government involvement – by capitalist enterprise.

The positive task of building working-class social power (or autonomy) was stressed alike by Marxists and anarchists, but anarchists rejected Marx's view that revolutionaries needed to use the powers of the state. The negative (and provisional) task of utilizing the state apparatus – perhaps suitably redrawn – was stressed by the evolving working-class parties. The latter, on the other hand, tended to lose sight of how social production itself would have to be reconfigured once the capitalist class had been stripped of its power. The challenge for Marx and his successors was to balance these two complementary yet potentially conflicting agendas.

In the subsequent history of Marxist theory, the impulse that had some affinity with anarchism – which encompassed worker control, council communism, and currents emphasizing cultural transformation – would repeatedly make its appearance as a critical motif and occasionally also in the form of a social movement (e.g., workers' councils in northern Italy, 1919–1920; anarchist collectives in eastern Spain, 1936–1939) (see Wallis 2011). For much of the twentieth century, however, it was overshadowed – and at key moments actively suppressed – by the agenda of winning state power, legally dismantling capitalism, and resisting external attacks. This primarily political focus was expressed initially in the “revisionist” debates within the German Social Democratic Party, in which Rosa Luxemburg argued along classical Marxist lines (against Eduard Bernstein) that the notion of attaining socialism through a succession of parliamentary reforms was unrealistic. But this conclusion, while establishing the need to transform the state, left open the question of how that revolutionary process would unfold. Here, the terms of the debate

were posed in V.I. Lenin's landmark 1902 tract, *What Is to be Done?*

Lenin's theoretical views, like those of Marx, have often been subjected to formulaic renditions. This is facilitated by his numerous categorical statements as to the indispensability of enlightened leadership. Quoted in isolation, such statements readily suggest an authoritarian and manipulative approach to the formation of working-class consciousness. Lenin, however, was no less a dialectician than Marx. Both in *What Is to be Done?* and in *State and Revolution* (1917), the same passages in which Lenin affirms the role of a vanguard, also include remarks making clear his view that such a role is inconceivable if the vanguard is not organically linked with the masses. The level of mass initiative and even the extent to which the masses could directly enter the party organization were, for Lenin, dependent upon variations in political culture and historical moment. *What Is to be Done?*, where Lenin spoke of revolutionaries as “professionals,” took on distinctive importance as an articulation of the basis for the 1903 split in the Russian Social Democratic Party (in which the Bolshevik [later Communist] party opted for a revolutionary course); but Lenin would later insist that his particular points of emphasis at that time needed to be viewed in context and not treated as timeless guideposts (see Le Blanc 1993, chaps. 4, 12).

The theoretical underpinnings of the November 1917 revolution in Russia may be encapsulated under three headings:

1. Lenin's argument (in *Imperialism: The Highest Stage of Capitalism*, 1916) that inter-imperialist rivalries [World War I] constituted a global capitalist crisis, signaling the timeliness of a breach in capitalist hegemony even if not initiated in one of the more developed capitalist countries
2. Leon Trotsky's theory of “uneven and combined development,” according to which “the privilege of historic backwardness . . . permits, or rather compels, the adoption of whatever is ready in advance of any specified date, skipping a whole series of intermediate stages” (Trotsky, *The Russian Revolution*, 1930, chap. 1)

3. Lenin's assessment in 1917 of class relations in Russia, notably, the precipitous delegitimation of the bourgeois government and – as shown in the composition of elected district councils (*soviets*) – the equally rapid radicalization of the masses (see, e.g., Žižek 2002)

This social conjuncture implied a narrow window of opportunity, while the global crisis and Russia's collapsed infrastructure suggested that there was space for creating a new authority whose natural tendency would be to "wither away." Such was Lenin's conception of the dictatorship of the proletariat, grounded in Marx's account of the radically democratic institutions of the Paris Commune (*State and Revolution*, chap. 1, sec. 4).

### Post-1917 Development of Marxist Theory

The subsequent evolution of the Soviet regime – encompassing the period of Stalin's personal rule (1929–1953), a succession of bureaucratic administrations, and eventual collapse (1991) – reflects a confluence of factors, including the multifaceted underside of "historic backwardness" as well as the initial devastation of war (1914–1918), prolonged and compounded by foreign military intervention (1918–1921) and then by the threat and eventual reality of yet another imposed war (1941–1945), followed immediately by an imposed nuclear arms race.

From the perspective of Marxist theory, the conclusion to be drawn from this succession of circumstances – or from its counterparts in subsequent revolutions elsewhere – is the impossibility of detaching any given historical process from the total context in which it unfolds. This context includes not only external constraints but also regressive personal habits ingrained by time-honored custom. During a revolutionary conjuncture, when people sense the possibility of breaking out of their usual routines, such habits (e.g., those predisposing to hierarchy and corruption) may be widely called into question. But from the moment that the prospects of such an opening are

closed back down, the old practices return in force.

Marxism is presented continuously with new subject matter by the very evolution and tenacity of the system which provoked its earliest theoretical formulations. This same process also repeatedly creates new revolutionary openings, whether in different geographical regions or in different dimensions of social existence. Moreover, even a regime that has lost its own revolutionary bearings may offer crucial logistical support to one with a fresh sense of purpose (e.g., Soviet support to Cuba starting in 1960). Similarly, a revolutionary process that is cut short (or that never even attains political power) may leave a cultural legacy that inspires activists of a new generation and even of other countries. To perceive such connections systematically is to understand how a seemingly all-encompassing and immutable power configuration can give way to one whose priorities are diametrically opposed.

Because of the antagonism inherent in any situation of class dominance, the lack (or paucity) of overt opposition reflects an accommodation that is artificial. The task of theory, then, is to bring to the surface a global demand which is already implicit in the existing power relations. Where for Marx such theoretical disclosure centered on the political economy of exploitation, for more recent writers, the focus has spread to draw other issues more directly into focus.

At the broadest level, what is involved here is the subjective side of the revolutionary process. The first major exponent for this dimension of Marxist thought was Rosa Luxemburg, who balanced her critique of the revisionists with an equally strong polemic against Lenin's conception of the vanguard. For Luxemburg, the commitment to democracy implied that one should prefer the "errors made by a truly revolutionary labor movement" to the "infallibility of the best of all possible "central committees" (*Organizational Questions of Russian Social Democracy*, 1904).

Later theorists, including notably Georg Lukács and Antonio Gramsci, would probe further into the phenomenon of class consciousness, with Gramsci stressing especially the struggle for cultural hegemony. Walter Benjamin and Ernst

Bloch would explore quasi-religious sentiments of dread and hope; thinkers influenced by psychoanalysis (e.g., Herbert Marcuse and other members of the Frankfurt School) would highlight the malaise of “consumer society” while at the same time bringing out the insufficiency for socialism of a mere change in property relations; and theorists of the last third of the twentieth century (e.g., Ralph Miliband, Bertell Ollman, Ellen Meiksins Wood) would seek to show, among other things, how Marxist class analysis can address the needs of constituencies defined by gender, “race,” or other demographic attributes. Finally, the significance of direct working-class initiative and control would be brought back to the forefront in the writings of Harry Braverman and István Mészáros.

Meanwhile, Marx’s initial focus on the underlying dynamics of capital would be sustained through new phases of capitalist development by writers of varying but partly overlapping persuasions, ranging from Ernest Mandel, with his wide-ranging historical exposition, to the *Monthly Review* school (Paul Baran, Paul Sweezy, Harry Magdoff) and its emphasis on third world revolution to world system theorists (A.G. Frank, Immanuel Wallerstein) who dispute the view that even a partial or temporary break has yet been made in capitalist hegemony. The critique of global capitalism would continue to find its greatest immediate resonance in regions of widespread and deepening poverty, but as the environmental crisis became more acute, capitalist accumulation could be called into question on an even broader canvas (e.g., Foster 2002; Burkett 2006), to address the vast scope of social reorganization implicit in any serious effort to reduce the ecological footprint of the human species.

## Marxism (with Focus on China)

Qinqin Zheng

Department of Business Administration, School of Management, Fudan University, Shanghai, China

## Synonyms

Sinicization of Marxism

## Definition

Marxism is a system of Marx's theory, covering the whole view of Marx's scientific socialism theory on the future of society. It represents the proletariat and its party's compact and complete view of the world. Marxism is composed of three major parts: Marxist philosophy, Marxist political economy, and scientific socialism. Marxism is regarded as the doctrine of the thorough liberation of the proletariat and all humankind, guiding the ideology of the communist party of China and the cause of socialism. The theoretical system of socialism with Chinese characteristics not only adheres to but also develops Marxism.

## Description

Founded by Marx and Engels in the 1840s, Marxism is a scientific system of proletarian thought that critically inherits and absorbs the outstanding achievements of natural science, thinking science, and the social sciences. In practice, it is a constantly enriched and improved scientific worldview and methodology. Marxism involves a series of basic theories, ideas, and methods. Within Marx's theory system, Marxist philosophy, Marxist political economics, and scientific socialism are the three main components.

- *Marxist philosophy* – Marxist philosophy includes dialectical materialism, materialist dialectics, dialectical materialism epistemology, and the materialist conception of history. Marxist philosophy helps us to understand the systematic economic and social changes through the analysis of the conflict between the classes. Marxist philosophy depicts class conflict as being derived from the growing contradictions between the high productivity of asset owners and the socialized labor of the proletariat. The surplus value created by proletariat is not fairly distributed among the workers but is instead concentrated in the hands of the asset owner. The consequence of this conflict is the alienation of owners, which will lead to social unrest and subsequently trigger revolution. The final result of the revolution is the establishment of socialism. Although Marx failed to predict the emergence of the communist society, he pointed out that socialism would become communism, due to the continuous development of science, technology, and productivity. At that time, the classes, state, and society would be replaced by public ownership: the best use of each one takes what he needs.
- *Marxist political economics* – Marx and Engels produced a new proletarian political economy that focuses on the relationship with production in different periods, especially capitalist/production relations. Marxist political economics clarifies the rules of production, exchange, and distribution of the material in the development stages of human society. In a capitalist society, commodity production is the dominant position, and the most important feature of capitalist production is a free employment system. The value of the labor force is determined by the value of the subsistence material necessary for the maintenance and reproduction of the workforce. Marx found that the labor force is a special commodity because the value it creates per day is much higher than the value used for daily consumption. In addition to compensating for the value of their labor force, workers must work extra hours every day, which Marx calls the surplus labor time or the surplus value. Marx's theory of surplus value reveals the secret of capitalist exploitation and became the cornerstone of Marxist political economics.
- *Scientific socialism* – Scientific socialism lies at the core of Marx's theoretical system. It mainly studies the historical conditions of the cause of proletarian liberation and the nature of the cause itself. Marx and Engels believe that socialism is the inevitable result of the development of social productive forces. It is the historical mission of the proletariat to overthrow capitalism and realize socialism. The class struggle against the bourgeoisie and the proletariat revolution is the only path to socialism. The working class must form an independent party that opposes all of the old

political parties. The first step in the workers' revolution is to make the proletariat rise up against the ruling class. Class struggle is bound to lead to the dictatorship of the proletariat, which will act as a transition to the elimination of all classes and the realization of communism.

The sinicization of Marxism and Chinese modernization have been unified intrinsically. The Communist Party of China combines the general principles of Marxist doctrine with the concrete practice of Chinese revolution, construction, and reform. In the process of formation, the Chinese Communist Party found that the method of socialist construction suited China's national reality, so the theoretical achievements are now known as Chinese Marxism.

The Communist Party of China has adopted Marxism as its guiding ideology since its foundation. However, the doctrine of Marxism cannot automatically help to solve Chinese problems. Marxism is only an abstract theory, when putting aside the Chinese characteristics. In ancient China, Chinese communists faced the special conditions of a semicolonial and semifeudal country. Thus, the road to China's social and historical development cannot be the same as in Western capitalist countries.

The Communist Party of China has experienced a process of realizing the importance of sinicized Marxism through combining the principles of Marxist doctrine with Chinese practice. The sinicization of Marxism enables the Chinese Communist Party to solve the real-world problems of China's revolution, construction, and reform. The practical and historical experience of China's revolution construction and reform is gradually being theorized into Chinese Marxism. As a result, Marxism is being enriched and developed by the new practice, new content, and new language in China.

## Materialism, Well-Being, and Ethics

Carole L. Jurkiewicz

School of Public Affairs, University of Colorado  
Colorado Springs, Colorado Springs, CO, USA

## Synonyms

Corporate social responsibility; Ethicality; Extrinsic motivation; Kardashian effect; Values

## Definition

Materialism in this context means excessive acquisitiveness and the over-valuing of consumer products and goods.

## Introduction

Materialism, conceptualized as a value, is a key tenet of many societies around the globe, and the amassing of corporeal goods has been viewed by many cultures over centuries as a higher-order moral pursuit. In addition to a criterion by which individuals are assessed, organizations across all sectors incorporate the pursuit of monetary gain as a foundational purpose. Research has indicated that materialistic values have a negative effect on individual well-being and life satisfaction, as well as serving as a catalyst for unethical behaviors.

Global values shifts away from materialism and toward personal happiness have significant implications for the long-standing preeminence of profit above all.

## Materialism

Materialism is generally viewed as an orientation that asserts possession of socially covetable material objects is a means of defining individual merit and value, that the greater the quantity and perceived exclusiveness of the articles possessed express one's unique identities; the more fanciable and sought after the objects, the higher the level of desirability it bestows upon the person who owns them. The term also encompasses the drive to profit from human interactions that some (cf, Rand 1964) contend is an elemental, perhaps instinctive, unconscious motivation over centuries and civilizations, even a defining characteristic of humankind. Congruent with this view, those who possess large quantities of goods and in particular an abundance of items that are viewed as more prestigious than others are considered more successful, captivating, and appealing. Flaws in personality, ethicality, physical attractiveness, health, or sociability can be neutralized by the quantity and perceived value of that individual's possessions. The prominence of logos on expensive merchandise has grown to such an extent that they create the objects' artistic pattern, and the ability to recognize what brand those symbols indicate is in itself among some a measure of sophistication and modish pride. The citing of elite brand names confers an exclusiveness on artists and songs, apparel, and those who pepper their social media with comments and photos testify to their exceptionalism.

Of course materialism as a method by which to rank individuals in comparison to one another is only effective insofar as few have access to the desired goods; if everyone were wealthy or possessed the same elite merchandise, then it would lose its exclusive luster and be reduced in perceived value to a common denominator; and how then would individuals determine who is more important than others? This pursuit of superlative

appurtenances is a learned behavior (Jurkiewicz and Giacalone 2016), an amaranthine acquisitiveness fueling profits for designers and merchants and orchestrating scarcity to inflate prices and magnify perceived value (Cialdini 2006). People across time have achieved notoriety for their consumption largess (Friedman 1990), popularly known as being famous just for having things, and many people have espoused the goal of acquisition in the pursuit of fame. Termed here as the *Kardashian effect*, it is named after a group of sisters in the current media who iconically have achieved fame through acquisition of elite products and services and who use digital media to communicate their acquisitions, leading to their own product lines of expensive and choice items. Such behavior is tagged the acquisition of identity, using cultural and material resources as signals of success and individuality. Yet research supports the adage that money doesn't buy happiness, and the findings hold across demographics and over time (Deckop et al. 2010). It is asserted that one cannot hold materialist values and experience personal well-being at same time; they are seen as incongruent values (Lee et al. 2011). Well-being is defined as a state of security, safety, prosperity, and health.

## The Effect of Materialism on Personal Well-Being

Well-being contributes to high levels of organizational performance and employee motivation more so than does the pursuit of materialism. Materialist values place the reaping of monetary rewards as the pinnacle of goal attainment, in opposition to achieving the satisfactions inherent in attaining competence, autonomy, and connectedness that comprise elements of well-being. A materialist framework requires that monetary rewards grow increasingly substantial in an unending pattern in order to maintain feelings of satisfaction, a phenomenon commonly known as the ratchet effect; such a culture of avariciousness is a costly enterprise for organizations. When a material reward is offered in return for behavior that was once intrinsically motivating, it often becomes required and

expected in order to get the employee to perform the same behavior again. Materialist motivation and behavior can thus lead to unethical decision-making as the pursuit of profit attains primacy over other outcomes (Jurkiewicz 2005).

Failure to achieve high levels of material satisfaction at work, either through lack of effort, lack of opportunity, or lack of available resources, can lead to employee dissatisfaction and low morale, whereas well-being can be achieved through job design and an organizational culture that is attainable by all. Well-being begets intrinsic motivation, which is self-sustaining; materialist values are extrinsically motivating, requiring external, tangible rewards in order to move individuals toward a goal (McClelland 1988). While extrinsic rewards associated with materialism can manipulate behavior in the short-term, intrinsic rewards are self-sustaining, freeing the leader to focus on other activities rather than provide ever more and larger carrots, incentives that serve to lower individual self-confidence and undermine employees' confidence in their abilities. Extrinsic rewards wean individuals away from seeking job satisfaction that is a key component of well-being and toward the tangible reward of materialism itself. Research using the post-materialism scale developed by Giacalone and Jurkiewicz (2004) with multiple groups has consistently demonstrated an inverse relationship between materialism and personal well-being.

### Materialism and Ethical Well-Being

The growth in expansive values globally has advanced the importance of generativity, benevolence, and personal well-being as the incitement toward materialism is waning among many (Jurkiewicz and Giacalone 2008). This includes increased ethical awareness regarding more compassionate human resource options, the impact of policies and practices on disadvantaged groups, and greater respect for employees' work-life balance. Concerns for social equity and social justice

have led to social movements still in the emergent phase that are projected to grow as thinking globally and acting locally becomes a mantra for generations. Individuals now seek personal fulfillment through their work relationships, and this dependency upon the workplace to satisfy employees' social needs is greater now than at any point in history (Giacalone and Jurkiewicz 2003). Such needs, if thwarted by an organization's focus on its financial goals over respect for its human resources, can steer employees toward acquisitive behaviors in order to feed the unmet need of well-being.

Value sets continuously adapt to organizational, social, and individual shifts (Hijal-Moghrabi and Sabharwal 2018), and as such it is of great value to leaders in all sectors to consider that organizational changes result in ethical changes. These ethical changes in turn bring influence to bear and serve as a catalyst for further individual, organizational, and sector-specific developments.

### Conclusion

Materialism is the belief that the acquisition of possessions that are viewed as elite and available to only a choice few is the defining focus of one's life. Owning and displaying such possessions confers a level of desirability and attractiveness that can overcome deficits in character, responsibility, and positive citizenship. Materialistic values play a central role in the ethicality of decision-making, establishing the goal of profit-making as more important than other objectives. Such an orientation has within it its own perpetual reward system that is unquenchable, as to meet a goal of profitability, the next must supersede the last, establishing standards of the pursuit of ever-higher achievements into the future. Materialistic orientations are in opposition to feelings of well-being. Globalization has introduced notions of expansive values, including concerns about quality of life and what one may be leaving for future generations. This newer value set has increased both the ethicality of

decision-making in those who possess it, as well as the satisfactions associated with feelings of well-being.

## Meaningful Work

Andrea Veltman

James Madison University, Harrisonburg, VA, USA

## Synonyms

Fulfilling work; Good work

## Definition

Meaningful work is a multidimensional concept; it does not have a singular definition. Work can be meaningful in virtue of developing or exercising human capabilities, providing workers with a source of purpose, or integrating elements of workers' lives. Meaningful work has both subjective and objective dimensions: both subjective feelings of fulfillment and objective dimensions of purposefulness, connection, or self-development can make work meaningful.

## Description

Meaningful work is central in a happy life. For a worker, work is not only a way of securing an income and material benefits, it can also support personal growth, skills development, self-esteem, self-respect, autonomy, social relations, and virtues like honor, pride, dignity, and self-discipline. Work also has a formative influence on a person's character and intelligence, provides a source of social recognition and personal identity, and serves as a way for people to contribute to communities. Further still, work impacts the physical and psychological health of workers, for better or for worse. As occupational psychologists Ivan Robertson and Cary Cooper summarize, "to be psychologically healthy we need to feel that what we are doing is worthwhile and serves a useful purpose" (Robertson and Cooper 2011, 89). In brief, work has a considerable impact on those who perform it, and it is unlikely that people

can thrive without good work, given the substantial psychological, social, and economic benefits that attach to good work.

Work can be meaningful for a worker for several reasons:

- The development or exercise of capacities, skills, and talents. Developing and exercising human capabilities is a defining feature of human flourishing, and work is a primary life activity through which people can achieve self-development and express individual skills and talents. For thinkers like Aristotle, developing and exercising our distinctive abilities is part of the purpose or function of being human. The contemporary philosopher John Rawls also argues that the pleasure or satisfaction we experience in exercising our realized skills and capacities – which he calls the Aristotelian principle – is a natural principle of human motivation (Rawls 1971, 426).
- Social or interpersonal recognition of personal effort, skill, and contribution. Recognition theorists emphasize that human beings have a constitutional dependence on recognition and esteem, and recognition for a job well done lubricates healthy psychological functioning, both within and outside of work (Tweedie 2013). Even beyond academic literatures on recognition, the importance of recognition at work is plain to see. The television series *Undercover Boss* is replete with employees who are in joyful tears of pride on account of finally being recognized by their ultimate boss for their skills, enthusiasm, competency, ingenuity, commitment, or personal flair on the job. When workers are not recognized and valued for their work, morale decreases, and work becomes a matter of mustering on dispiritedly.
- Supporting virtues including honor, dignity, pride. Meaningfulness and moral virtue have an ancient association, in that classical philosophers appeal to the human function or purpose – and in short order to moral and personal virtue – in addressing the question of how a person can live an excellent human existence. Although ancient Greek philosophers did not view work as a life activity that supports human excellence, today we recognize work as predominant venue for acquiring a range of virtues, including not only honor and dignity but also dependability, industriousness, cooperativeness, self-discipline, and self-reliance. Connecting a meaningful life and moral virtue, contemporary philosopher Laurence Thomas argues that a virtuous person is favored to lead a meaningful life, as a virtuous person possesses a healthy state of mind that facilitates the pursuit of activities that define her identity and give her reason to go on in life.
- Providing a personal purpose or serving a useful purpose for others. Work is characteristically a purposeful activity, in that work aims to produce something beyond itself. The purposefulness of work connects workers to communities: as workers provide items or services of value, they themselves become valuable to communities, feeling genuinely useful in a world that is larger than themselves. Among other activities, work can therefore provide a person a purpose in life and engender feelings of belonging in a community. This dimension of meaningful work imparts meaningfulness to a wide variety of occupations, though it appears stronger in some work than in others. For instance, someone on the cusp of finding a cure for leukemia may have a strong and justified sense that part of the core purpose of his life is to finish his work and impart it to the world.
- Producing something of enduring value. Lasting durability in the products of work arguably enhances the meaningfulness of work. Enduring work (as in the work of stone masons, architects, or book authors, for example) fulfills a human desire to make a mark on the world. In this vein, philosopher Bertrand Russell writes in *The Conquest of Happiness* that one of the chief elements of meaningful work is the construction of something that endures: “In some work, though by no means in most, something is built up which remains as a monument when the work is completed... The satisfaction to be derived from success in a great constructive enterprise is one of the most massive that life has to offer, although

unfortunately in its highest form it is only open to men of exceptional ability. Nothing can rob a man of the happiness of a successful achievement in any important piece of work, unless it be the proof that after all his work was bad” (Russell 1930, 212, 214–215).

- Integrating elements of a worker’s life. Work not only touches personal identities but also reflects life narratives and relationships that are themselves meaningful. A person might work for a family business, for instance, and find his work meaningful on account of reflecting and sustaining relationships that help form his identity. Work can also integrate elements of life when a career reflects skills and values developed over a lifetime, or when work situates a worker in an environmental or relational context with which she deeply identifies. A worker may choose a particular job because it plants her in her hometown, reflects her personal or family issues (as when a person chooses to become a healthcare worker because of the health issues of her family members), or connects with her past (as when someone in food service says she enjoys feeding people because, as a child, she went without food herself). In any of these cases, work draws meaningfulness from a personal relational context, often making the life of the worker more coherent and integrated.

In light of the importance of meaningful work in a good life, one might ask, “is it a duty of businesses and other employing organizations to provide meaningful work?” Some may hesitate to say “yes,” given a belief that the ethical responsibilities of businesses should be understood as minimal, or given a belief that what makes work meaningful is hopelessly subjective, diverse, and relative to the individual. Philosopher Richard Arneson, for instance, lays bare several reasons why we should reject any notion that people have a right to meaningful work – a notion that runs corollary to the idea that business and other organizations have a duty to supply meaningful work. He argues that meaningful work is too agent-relative to be the sort of good that an organization is obligated to provide to workers, and on top of

this issue liberal democracies ought to respect that individual conceptions of the good life are diverse and may not include meaningful work (Arneson 1987). In contrast, Andrea Veltman makes the case that businesses and other employing organizations merit moral esteem and achieve full moral integrity insofar as they provide opportunities for meaningful work. She does not postulate mandates on the part of businesses, governments, or other organizations to provide meaningful work but believes we should recognize the social value and praiseworthiness of providing opportunities for meaningful work. In this view, providing meaningful work is part of a robust business and professional ethics (Veltman 2016).

## Medical Ethics and the Land Ethic

Alistair Wardrope

### Synonyms

Health and the environment

### Introduction

Human health depends upon our environment. As the authors of the *Lancet-Rockefeller* commission on Planetary Health put it, “human health and civilisation depend on flourishing natural systems and the wise stewardship of those systems” (Whitmee et al. 2015). In the Anthropocene – the proposed term for our current geological era, in which human activities have a defining effect on Earth systems – the opposite is also true. Within mainstream biomedical ethics, there has until recently been little interest in our relationship with nature, or healthcare’s environmental impact. However, the health effects of current global environmental changes – heating, biodiversity loss,

ocean acidification, and land-use change, among others – demand attention to our moral responsibilities toward nature. The resources of common bioethical theory struggle to meet this challenge, requiring their supplementation with further approaches.

The Land Ethic – originating in the work of the US conservationist Aldo Leopold – offers one such approach. It contrasts with contemporary biomedical ethics in presenting an ethic that is: *holistic* – valuing communities in ways irreducible to the value of individual members; *biocentric* – assigning noninstrumental value to nonhumans; and *diachronic* – concerned not just with short-term consequences of particular decisions, but with long-term results of patterns of actions performed by many agents. Two key concepts guide its application: *the ethical sequence*, which sees the Land Ethic as adding to, not replacing, ethics governing interactions between humans; and *the ecological conscience*, which advocates an agent-based ethic. This entry describes core features of the Land Ethic, contrasting it with mainstream bioethics; illustrates how the Land Ethic negotiates challenges for Anthropocene medical ethics; and sketches some applications in clinical practice.

### The Land Ethic

Most famously articulated in a posthumously published 1949 essay, the Land Ethic is developed in decades of Aldo Leopold’s field work, conservation practice, lectures, and essays. The Land Ethic defies simple summary, but its core components are presented here.

#### The Community Concept: Holism and Biocentrism

Contemporary bioethics commonly assumes that moral value ultimately should be determined at an individual level. James Beauchamp and Tom Childress’ *Principles of Biomedical Ethics* (2019), for example, surveys five candidate theories for “moral status,” all of which assume that

the bearers of moral status are individuals.<sup>1</sup> Furthermore, these criteria are developed and evaluated in terms of whether they appropriately capture *human* moral value. Other entities may have instrumental value – but only individuals (and individual humans, at that) are taken to be potential bearers of *intrinsic* value – ends-in-themselves, not just means to such ends (Callicott 1989, 131).

Aldo Leopold witnessed first-hand the fallacy of conceiving individuals – or even individual species – as independent from their environments. Whether under-predation of deer resulting in deforestation, or livestock overgrazing resulting in soil degradation, Leopold repeatedly describes how the health of the individual cannot be understood absent an appreciation of the whole:

Ecology tells us that no animal – not even man – can be regarded as independent of his environment. Plants, animals, men and soil are a community of interdependent parts, an organism . . . Mr Babbitt is no more a separate entity than is his left arm, or a single cell of his biceps. (Leopold 1991, 209)

Leopold's insight was to see that acknowledgment of this ecological interdependence requires a consonant shift in ethical attitudes: it “changes the role of *Homo sapiens* from conqueror of the land-community to plain member and citizen of it. It implies respect for his fellow-members, and also respect for the community as such” (Leopold 1949, 204). From an ecological perspective, human health does not simply depend upon planetary health (Whitmee et al. 2015); the “human” and “planetary” divide is itself arbitrary, imposed upon an interdependent whole. Just as it makes limited sense to consider a single cell of our biceps as having intrinsic value – shorn of its context within a functioning organism – so Leopold proposes that it makes little sense to focus on our intrinsic value as individuals, shorn of our context within a functioning ecological community.

Thence we derive perhaps the most-quoted line from Leopold's work:

A thing is right when it tends to preserve the integrity, stability, and beauty of the biotic community. It is wrong when it tends otherwise. (Leopold 1949, 224–225)

This maxim encapsulates two key features of the Land Ethic. It is *holistic*, in that it assigns value to the *community* taken as a whole. It is also *bio-centric*, insofar as the community is not human but *biotic* – humans are “plain member and citizen” of a wider community. The boundaries of this community are determined by the mutual interdependencies of entities within an ecosystem.

A weak justification of this biocentrism might be made on instrumental, anthropocentric terms. Ignorance of our dependence on the land community risks leaving us in “the biological category of the potato bug which exterminated the potato, and thereby exterminated itself” (Leopold 1991, 127). But Leopold's reading of the implications of ecology for our ethics goes deeper; once we begin to see ourselves as inseparable from the “soils, plants, and animals” with which we are bound up, we extend to them the same sorts of moral consideration we show members of our human communities. The intimate portraits of the plants and animals Leopold encounters throughout his work and leisure are therefore not mere “romantic passages” (Potter 1988, 22); they serve as intuition pumps to motivate our moral perception to expand its definition of community (Callicott 1989, 125; Wardrobe 2019).

### Thinking Like a Mountain: Diachronic Ethics

Leopold's definition of right quoted above also introduces a third key component of the Land Ethic; in emphasizing “integrity” and “stability,” it takes a *long-term view* of how to determine what is right. This *diachronic* perspective contrasts with the *synchronic* orientation of mainstream bioethics. The latter viewpoint is evident, once again, not as an explicit premise, but in how problems are constructed. The archetypal problem of mainstream bioethics is the “moral dilemma”: a situation in which an identifiable person has to decide which of a small selection of competing courses of action to take; usually such action will affect a small number of relevant parties (Beauchamp and Childress 2019).

<sup>1</sup> Reference to the moral status of nonhuman animals, or ecosystems, is confined to a single footnote acknowledging the existence of “parallel debates in environmental ethics,” that are taken to have no bearing for biomedical ethics.

A diachronic view asks instead: what are the broader consequences of many agents, in relevantly similar situations, throughout a protracted period of time, taking similar courses of action? Leopold's phrase for this is "thinking like a mountain," studying how the long-term consequences of our actions ramify through community and ecosystem.

Leopold saw the effects of failing to think like a mountain in the land on which he worked. In human health, we are seeing this same pattern played out, as post-industrial improvements are threatened by the fossil fuel, land, and ecosystem exploitations that fuelled them. The Planetary Health Commission's warning that "we have been mortgaging the health of future generations to realise ... development gains in the present" (Whitmee et al. 2015) was predicted by Leopold:

The process of altering the [biotic] pyramid for human occupation releases stored energy, and this often gives rise ... to a deceptive exuberance of plant and animal life, both wild and tame. These releases of biotic capital tend to becloud or postpone the penalties of violence. (Leopold 1949, 218)

Fossil fuels – condensed, stored, organic energy, formed over millions of years – are perhaps the ultimate form of "biotic capital." Their indiscriminate use in the pursuit of economic development has produced just such a "deceptive exuberance" of apparent progress; the planetary changes of the Anthropocene represent the delayed "penalties of violence."

### Nineteen Centuries and Only Half Done: The Ethical Sequence

The holism and biocentrism of the Land Ethic has led many critics to allege that it risks sacrificing the interests and welfare of individuals to the greater good of the ecosystem; that it is "holistic with a vengeance" (Callicott 1989, 84). However, this charge neglects the multilayered account of moral responsibility that Leopold proposes. In his account, our holistic responsibilities augment, not supplant, responsibilities to individuals. The latter ultimately depend on our relative positions with the community that defines the whole:

[A] land ethic changes the role of *Homo sapiens* from conqueror of the land-community to plain

member and citizen of it. It implies respect for his fellow-members, and also respect for the community as such (Leopold 1949, 204; *my emphasis*).

In "The Land Ethic," Leopold describes this proposal in what he calls "the ethical sequence": a progressive widening of the scope of morality. He provides a cartoon history of morality, starting with relations between a narrow group of individuals deemed worthy of moral concern; for example, the Ten Commandments proscribe certain forms of action toward another person, while in the Homeric epics, the virtuous person need display no moral concern toward slaves. Subsequent developments both widened the scope of moral consideration (as sexist, classist, and racist barriers to moral status are rejected) and governed more complex social relations (from interactions between individuals, to those between individual and various social arrangements) (Leopold 1949, 202–203).

Leopold is clear that this Whiggish view is historically inadequate. It has failed to describe human responsibilities to one another, having "required 19 centuries to define decent man-to-man conduct and the process ... only half done" (Leopold 1991, 345–346). It also emphasizes a Western moral tradition whose predominance he elsewhere considers a "historical accident" and highlights the deleterious results of settler colonialism in exporting this perspective worldwide (Leopold 1991, 179; 311). The ethical sequence rather illustrates that in subsequent stages of the sequence, moral developments do not supplant their predecessors, but come as "accretions" that enhance prior regulations on action. Thus when we act on our responsibilities as citizens of a democratic state, we do not feel any less need for respectful interactions with our neighbors, or kinship ties to our family.

These accretions must, however, modify the moral codes that came before them. It is not the case that the moral status of Odysseus' slaves enters into consideration only once Odysseus' property claims on them are satisfied – the recognition of slaves as persons reshapes the moral landscape of Odysseus and his fellow wealthy, male Greeks. How does recognition of the moral

status of the biotic community reshape our moral landscape? Leopold's answer to this is bound up in the shift quoted above – from “conqueror” to “plain member and citizen” of the land community. Our responsibilities to humans, nonhumans, and the ecosystem as a whole are grounded in a shared community; responsibilities differ depending on our relative positions within that community.

Elsewhere Leopold uses the model of *kinship* relations to explicate this (Leopold 1949, 109). This involves seeing the moral landscape in terms of relationships like those between family and friends (Whyte 2020). Kinship serves as an important guiding principle in some Indigenous American ethics (Whyte 2020); their application illustrates a kinship ethic in practice.<sup>2</sup>

Within these ethics, different forms of kinship ties entail different responsibilities – as responsibilities to our immediate family may differ from those to different other members of our communities – but all are defined at least in part by reciprocity, or a respect for the gifts each member of the community can offer the community, and a motivation to provide gifts to support them in return (Whyte 2020). On this understanding, our responsibilities to our human relatives – who remain our close kin – are not supplanted by kinship to the nonhuman ecosystem; but our use of the resources of that ecosystem to support human ends requires that we in turn feel motivated to provide for it in return, protecting the health and resilience of the biotic communities upon whose gifts we depend.

### The Ecological Conscience

A last key concept for implementing a Land Ethic is what Leopold labels “the ecological conscience.” This term is his shorthand for an agent-

based system of ethics dependent on seeing our position within a biotic community, and drawing moral responsibilities from the bonds of that community. He argues that responsibilities to the land cannot be codified solely in laws or criteria for right action, for two reasons: our understanding of ecological science is inadequate to predict all the interdependencies of the land community sufficiently; and the existence of obligation to a community without conscientious affiliation results in action according to the letter, but not the spirit of those obligations (Leopold 1949, 194–209; Wardrobe 2019). Leopold encountered time and again in his working life examples of these shortcomings, conservation efforts falling short when dependent solely on legal regulation, without any motivation beyond adherence to law (Leopold 1991, 338–348).

The ecological conscience thus makes the Land Ethic a form of virtue ethic – but one in which the *telos* of the virtuous agent is derived, not from some anthropocentric ideal of human flourishing, but rather the well-being of the land community (Wardrobe 2020).

### A Perfect Moral Storm: The Need for a Land Ethic

The last 150 years have seen vast (but unequal) progress in human health and healthcare. They have also seen the resource demands of healthcare spiral, to the point where health systems comprise a substantial proportion of the total environmental footprint of many industrialized nations (Wardrobe 2019, 2020). However, recognizing a moral imperative to act has been compromised by lacunae in our ethics – the nature of the problem creates a “perfect moral storm” that leaves us “extremely vulnerable to moral corruption” (Gardiner 2006).

Stephen Gardiner outlines the features of environmental health threats like climate change that combine to create the perfect moral storm (Gardiner 2006). The first is of *dispersion of causes and effects*: the consequences of actions that cause environmental health threats are felt globally, and across time; rather than identifiable

<sup>2</sup>This is one of the many overlaps between Indigenous American thought and the Land Ethic, with particular associations between Leopold's thought and those of the Anishinaabe peoples of the Great Lakes region where he latterly lived (Callicott 1989, 177–221). He also shows an affinity for the Apache relationship with the land community over that of his fellow settlers of the American Southwest (Leopold 1991, 179; 239–244).

individuals being harmed, they create an indeterminate number of present and future victims at a spatial and temporal distance from the action. The second is of *fragmentation of agency*: global environmental health threats occur as the cumulative result of patterns of activity across individuals and societies, so the harms suffered by their victims cannot be readily assigned to any one action or agent. The third is *institutional inadequacy* – existing institutions, policies, and governance frameworks fail to provide the tools needed to meet the challenge.

Van Rensselaer Potter (1988) argues that bioethics' focus on individual rights and autonomy, emphasis on technological developments and clinical practice in industrialized healthcare settings, and short-term, action-based construction of moral problems leaves it highly vulnerable to this moral storm. This vulnerability can be found in precisely the characteristics that distinguish it from the Land Ethic: in being individualistic, anthropocentric, synchronic, and having a conservative orientation toward existing legal or deontological frameworks (Wardrope 2020). While health systems in industrialized nations may account for as much as 8% of their nations' total environmental footprints (Wardrope 2019), it is not the case that any individual clinical decision will make a significant difference to the ecological consequences of healthcare; and while it is (relatively) straightforward to predict the risks or benefits of that decision for the individual patient, the downstream implications of many such decisions are far less transparent. In combination, these properties make it easy for the clinician to say – however regrettable the consequences may be – it is “not *my* fault” (Gardiner 2006). The diachronic and holistic perspective of the Land Ethic, however, turns this problem on its head: it asks us to start from the recognition that – evaluated holistically, and in the long-term – the damage done to the biotic community by unchecked global environmental change is a major wrong, then to let this “ecological conscience” guide our decision-making in present courses of action. If acting in accordance with existing legal and professional frameworks has such results, then a Land Ethic demands that we rethink those frameworks.

## A Clinical Land Ethic in Practice

Concluding with a discussion of how a Land Ethic can shape clinical practice in the Anthropocene. It invites us to move away from a view of health workers and their institutions as separate from their social and biotic communities, towards one that sees them as “plain member and citizen” of both. Different health workers occupy different positions, and so their responsibilities change consonantly; but their practice can be shaped in ways that preserve the integrity, stability, and beauty of the biotic community, while not compromising our professional and kin responsibilities to colleagues and patients.

A potent illustration of our membership of the biotic community comes from antimicrobial resistance (AMR). AMR poses a huge threat to current and future human health, with an extra 10 million lives per year estimated to be at risk by 2050 as a result. Its causes are diverse, but include inappropriate or excessive antimicrobial prescription, environmental pollution from manufacture and disposal, agricultural misuse (e.g., as growth promoters), and changing patterns of human trade and travel. The ecological perspective makes clear that clinicians' responsibilities for AMR do not simply involve whether or not to prescribe antimicrobials for a given patient: as members of the biotic community, we are as much implicated in AMR through how we travel, how we eat, how we serve as vectors – the Land Ethic makes these questions just as relevant to clinical ethics (Wardrope 2019).

The ecological perspective also encourages us to view our healthcare institutions as within, shaped by and shaping our communities. Hospitals and surgeries can be designed and used in ways that align more or less with the interests of the biotic community. Hospital sites can build green and wild spaces within urban environments, or be used to shape travel infrastructure that promotes walking and cycling; primary care practices can co-locate with food cooperatives to support sustainable and healthy diets, or practitioners can use “social prescriptions” for active travel and access to nature. Such measures can improve health, while creating demand for communities

to be structured in ways that are better for human and planetary health. This reenvisioning of care need not compromise short-term human health outcomes: environmental footprint and resource consumption of healthcare correlates very poorly with health outcomes (Wardrope 2020).

## Conclusion

Human and planetary health in the Anthropocene are two sides of the same coin. Responding to the ethical challenges of global environmental health threats requires ethics to move beyond individualistic, anthropocentric, and synchronic concerns. The Land Ethic provides tools with which we can enrich our view of the moral landscape and encourage development of an ecological conscience that might help address these challenges.

## Military Industrial Complex (MIC)

Edmund F. Byrne

Emeritus Professor, Indiana University-Purdue University at Indianapolis, Indianapolis, IN, USA

## Synonyms

Permanent war economy; War corporatism

## Definition/Introduction

“The military-industrial complex” (MIC) refers to a self-sustaining politico-economic system that perpetuates profitability in military supplies industries, de facto in multiple countries but primarily in the USA. It is made up of competing and/or collaborating entities – the maintenance of which is on the whole financially advantageous to all concerned. These include professional soldiers et al., managers and owners of industries that supply military equipment, government officials whose careers and interests are tied to military expenditure, and legislators whose districts benefit from defense procurement (Rosen 1973, pp. 1–2). The complex business objectives sought by these and other related personnel are fostered in part by exalting technical possibilities but also by spreading fear as to dangers that are imminent

and can be countered only by maintaining the highest feasible level of military preparedness (Hallowell 2016). In pursuit of these objectives, MIC participants' budgetary requests amount to meticulously orchestrated industry advertising portrayed as strategic force requirements. Given this state of affairs, the preeminent business ethical questions with regard to an MIC involve ends as well as means, i.e., not only death and destruction but systemically inherent pork and waste.

### **MIC Companies' War-Oriented Strategy**

C. Wright Mills (1956) formulated the concept of an MIC, and President Dwight Eisenhower famously warned about it in his 1961 Farewell Address. The entity itself had come into being during WWII as competing countries built up their military hardware in concert with the build-up of military manpower. When that war came to a cataclysmic end, the losers' industries were severely pacified; but the winners, especially in the USA, intensified their production of warmaking equipment and, no less assiduously, their search for enemies against whom that equipment could be used (short of nuclear holocaust). And whenever so used if not used up the user government needed to fund so-called defense industry corporations to replace shortfalls of old equipment; and, increasingly, this process of replacing the old came to be supplemented with projects to introduce new means of mayhem aimed at meeting speculative future challenges.

If this industry consisted as do others of free-standing companies that respond to changes in the market by changing their mix of products to remain relevant, its list of products would have changed considerably over the past seventy-some years. And in fact, budgetary reductions were at times deemed circumstantially possible and desirable, e.g., at the end of a war, notably that in Vietnam, or more so following the demise of the USSR. MIC companies are not free-standing, however, but depend on government funding the size of which is based on a need to confront dangers that seemingly can only increase. Thus challenged the industry seldom discontinues old

products, not even if the military itself asserts no need for them; and new products are rarely left unfunded merely because experts claim they will never be effective. In an artificial budgetary climate like this, in which careful estimates of demonstrable need are seldom relied on, budgetary bottom lines are more likely to be derived from actual confrontations such as the September 11, 2001, attacks. For these lend weight to estimates of risks posed by terrorists whose defeat will require a massive infusion of funds into companies whose products and services will be needed if the nation is to be adequately "defended."

The MIC's monetary distribution system involves interdependencies so complex that downsizing, never mind abolishing, it is generally deemed virtually unthinkable. Lobbyists for the contractors give their preferences weight by distributing vast sums of money to parties issuing contracts through the US Department of Defense (DoD) ([OpenSecrets.org](https://www.opensecrets.org) 2015). In addition, the actual manufacture of parts for weapons systems is distributed among plants deliberately located in most if not every Congressional district. A Congressional representative's campaign contributions, hence voter support, ultimately depend on his or her level of support for the budget from which local defense manufacturers receive their contracts. Governmental public and nonpublic MIC employees similarly risk losing their jobs if they are not supportive of this system in every way (Hartung 2011, Chap. 1; Reich 2010). Apart from these domestic arrangements, many of the companies dealing with DoD are multinational in scope, and thus so is the US MIC. Non-US weapons procurers deal directly not with contractors but with Foreign Military Sales (FMS), a program in DoD, that uses the Defense Security Cooperation Agency as its intermediary.

### **MIC Budget Amounts**

The size of the US MIC budget has grown considerably over the course of its existence since WWII. Consider these numbers adjusted for inflation. In 1948, the main but not total DoD budget

was just over \$97 billion. It rose to \$444.5 billion in 1952 at the peak of the Korean War, then fell to as low as \$216.3 billion in 1955. Yearly increases up to and during the Vietnam era brought the total to \$413.3 billion in 1968. Decline during the 1970s was reversed during Reagan's presidency, up to \$551.8 billion in 1985. Totals then declined again and stood at \$391 billion in 2000.

A fiscal year later, terrorists' carried out their hijacked planes assaults, and thereafter totals climbed to \$756.3 billion in 2010 (war peak for Iraq and Afghanistan). But by 2015, they had leveled off to a Reagan-era size of \$501.8 billion or, by another calculation, \$598.5 billion (McCartney and McCartney 2015, pp. 23–25). The latter figure represents 54% of 2015 discretionary spending, and if the \$65.3 billion for Veterans Affairs is added in, the military budget rose to 60% (National Priorities 2015).

The complete total of MIC funding is not easily determined, because much of it is not shared with the public, but a partial accounting is attainable. To begin, defense-related employees include not only military personnel but also in-house civilian employees and independent contractors. The resulting number of defense-related personnel employed in the US executive branch is arguably larger than the number of executive branch employees whose jobs are not defense related. In addition, defense contractors paid over \$50 million in 2015 to 655 lobbyists 423 of whom focused on defense (Cohen 2015). Even if so, claims that the MIC generates jobs is challenged by counterclaims that more jobs would be created if the funds involved were spent on civilian projects (Pollin and Garrett-Peltier 2007).

Some military-related funding does not pass through the DoD budget. For fiscal 2016, for example, its budget of \$573 billion did not include the additional \$163 billion earmarked for the Department of Veterans Affairs. Privately funded and yet perhaps of seminal importance are the Grand Strategy Programs (GSP) whereby conservative philanthropists pay intellectuals at a small number of universities to do research and teaching conducive to creating a "Long War University" that prepares students for permanent war. Collectively, the participating universities constitute

"national warfare state universities." Their mission is to educate students with regard to counter-insurgency or COIN. Their funding levels are, for example, \$17.5 million to Yale University and \$225,000 to Temple University (Horn and Ruff 2011).

Of course, any estimate of the MIC's total budget would be incomplete without inclusion of its nuclear weapons arsenal. At the height of the Cold War, the USA and USSR had 70,000 nuclear weapons. The 2010 New START Treaty called for reductions to 1,550 each, and by 2014 they together had only 16,200 (Russia 8,500; US 7,700). Seven other nations together add another thousand nuclear weapons to the total. Reductions notwithstanding, then, the total number of nuclear weapons in existence is still very large and involves too many possessing nations. A Comprehensive Nuclear Test Ban Treaty would reduce these numbers still more substantially; but to achieve the necessary two-thirds support, it needs to be signed by six more nations including China (McCartney and McCartney 2015, pp. 120–131).

Nuclear weapons being so incomparably destructive, a number of activist leaders and organizations call for their complete abolition. Public opinion polls show comparable views worldwide and in the USA, with Americans increasingly negative about their use in WWII. This widespread anti-nuke attitude is drowned out, however, by the supportive roar from the MIC, and its preferences prevail. Publicly knowable funding for nuclear weapons over the nine fiscal years 2010–2018 is \$179 billion, rising from \$16 billion to \$25 billion, i.e., an average of \$20 billion per year. (This total combines DoD funds with funds allocated to the Department of Energy's National Nuclear Security Administration.) In themselves these are comparatively modest numbers, but they hold places for a plan to replace each leg of the "nuclear triad" – land-based, submarine-based, and bomber-delivered – over the next 20 years. The cost of this major refurbishing is an estimated \$500 billion. In the meantime, a few more status-seeking countries (e.g., North Korea) will probably have developed their own nuclear weapons and delivery systems.

## MIC Budget Allocations

During the post-Reagan years of decline, the US MIC underwent massive consolidation. Thereafter, the surviving firms won larger contracts, especially after 9/11. For example, the 2012 US defense industry was assigned a budget of \$793.9 billion. Much of that amount went to ten companies whose 2011 contracts and revenue were as follows: Lockheed Martin, \$40 billion and \$46 billion, respectively; Boeing, \$21.5 billion and \$69 billion; General Dynamics, \$19.5 billion and \$33 billion; Raytheon, \$15 billion and \$25 billion; United Technologies, \$8 billion and \$58 billion; SAIC, \$7.4 billion and \$11.1 billion; L-3 Communications, \$7.38 billion and \$15.7 billion; Oshkosh Corporation, \$4.94 billion and \$7.6 billion; McKesson Corporation, \$4.7 billion and \$112 billion (McCartney and McCartney 2015, pp. 36–38).

The 2012 US military budget cited above was 63% greater than the total of \$486.7 being spent that year by the next nine countries, which, in order of size, includes China's \$89.8, the UK's \$62.7, France's \$58.8, Japan's \$58.4, Russia's \$52.7, Saudi Arabia's \$46.2, Germany's \$44.2, India's \$37.3, and Brazil's \$36.6 (McCartney and McCartney 2015, p. 11). Among the top arms producers in the world outside the USA in 2013, the UK's BAE Systems was third largest with arms sales of \$26,820,000, Trans-European EADS was seventh largest (\$15,740,000), Italy's Finmeccanica and France's Thales were ninth and tenth with arms sales each over \$10,000,000. The largest Russian arms producer that year was twelfth place Almaz-Antey (\$8,030,000) (Kelley 2014).

The Pentagon (DoD's headquarters), built to house 40,000 military and civilian employees, currently has 23,000 plus 3,000 nondefense support personnel. As for contractors, the DoD by 2008 employed 155,826 private contractors in Iraq and only 152,275 troops. Also in 2008, it had 108,000 contractors in Afghanistan and only 65,700 troops (McCartney and McCartney 2015, p. 30). To this one needs to add separately allocated funds for military intelligence operations

(70% of which is now being spent by private contractors) (Bloomfield 2013).

As recently reorganized, the Intelligence budget, initially allocated to DoD, is dispersed to the National Intelligence Program (NIP), the Joint Military Intelligence Program (JMIP), and the Tactical Intelligence and Related Activities (TIARA) funding aggregation (GlobalSecurity.org). Because of Edward Snowden, we possess details of the 2013 US budget for national intelligence. Totalling \$52.6 billion, this budget covered a wide variety of occupations and services. Twenty-eight percent went to the Central Intelligence Agency, which paid its own 107,035 employees and 18% of all federal contractors. \$10.5 billion went to the National Security Agency, and another \$4.9 billion to "contingency operations" in Iraq and Afghanistan (Brown n.d.).

In retrospect, various areas in the world where bombs and bomb materials were produced and/or tested have become toxic wastelands, e.g., the A-test site at Bikini Atoll, the Columbia River area where the Hanford Project produced plutonium, and a host of other areas contaminated by military testing of nuclear and other weapons (Hanrahan and Smith 2011). So if one is serious about determining the total costs incurred by the MIC, damages due to weapons testing should be included, and these extend to the damage inflicted on persons, property, and environment by use of weapons in live wars. These amounts are immense and to a large extent irreversible, but restitution claims are severely suppressed by the pro-warmaker character of international law. For example, in one attempt by US and Afghan negotiators to agree on compensatory damages to property arising out of the war in Afghanistan, the latter claimed \$100 million, the former came up with a figure of \$1.4 million (Shah and Nordland 2011; Kamrany and Taft 2012). Such damage awards, however calculated, are generally much smaller than those for environmental damages (Hulme 2004).

In short, the task of determining whether efficiencies created by the MIC outweigh its multifaceted excesses is a project still underway. Its

completion requires addressing various questions as to scope, i.e., regarding which additional entities are engaged actively or passively in MIC-related activities. There clearly are such entities, so the very concept of a military-industrial complex is often considered incomplete without inclusion of these unnamed components. Doing so would yield, for example, a military-industrial-congressional-lobbyist complex. Still more troubling is an emerging plan to shut down or privatize a number of US government civilian agencies and transfer their funds to MIC entities (Hartung 2017). Whether such a plan is ever accomplished, it can already be argued that some participants in the MIC are engaging in unethical business practices (Byrne 2010, 2017).

## Misinformation, Disinformation, and Journalism Ethics

Manuel Chavez and Eric Freedman

School of Journalism, Michigan State University,  
East Lansing, MI, USA

### Synonyms

Algorithms; Automated journalism; Disinformation; Ethical norms; Fake news; Misinformation

### Introduction

Deciding what is trustworthy information in the newsroom has become more complex as technology has been compromised by a flood of misinformation and disinformation, especially through social media. Journalistic ethical practices of fairness, balance, and accuracy are being pressured by the speed of news dissemination and by policies that encourage the use of multiple platforms to publish and broadcast news – real fast. Even deciding what is newsworthy – a key journalistic value – is challenging to journalists because it is difficult to verify the veracity of information, its sources, and the intentions of those who share it. In many cases, by the time reporters and editors have vetted the content, the information has been disseminated, quoted, liked, retweeted, hyperlinked, and shared. And the ethical problems are not only about words and frames but also about altered, manipulated, or doctored pictures, graphics, and videos.

New forms of nonhuman digital interaction in social media have generated abundant cases in which governments or organizations use bots or trolls to disseminate false information masked as genuine and accurate. Efforts by journalists and news organizations to counter them are inadequate and isolated, and the need for ethical norms across a new function of fact-checking looks more and more like a permanent desk or beat in the newsroom. Journalism is not alone in the efforts to curb false information

dissemination. Social media companies are developing applications to detect and stop diffusion of false information, and some governments are seeking remedies by regulating the manufacture and spread of misinforming and disinformation. The complexity of controlling false information is vast, however, and there are many actors involved in it, including, ultimately, the public.

This entry defines misinformation as false or incorrect information produced unintentionally, while disinformation is information that is intentionally altered to cause confusion and deception. In journalism research, the latter is referred as false, made-up, or fake news (Tandoc et al. 2017).

### Journalism Accountability and Ethics When Information Is Openly in Sight

Publishing, posting, and broadcasting trustworthy information is a core function of the news media, but efforts to ensure that the information is accurate and reliable are a major challenge for professional journalism. The pressures of being the first to break news impose new demands for accountability and ethical conduct. Yet when algorithms and computer-generated dissemination models travel faster than humans can verify content, news organizations should still be obligated to validate what they disseminate. The pressure to fact-check even comes from ordinary Americans who responded in a national survey that it is journalists' responsibility to ensure that information is real and accurate. And worse, the same survey reported that almost seven in ten adults recognized that made-up news greatly harms public confidence in government institutions. While almost half of Americans responded that made-up news is a critical problem created by politicians, only a bit more, 53%, said the news media is responsible for reducing false news. This issue is highly ranked and is among the top five serious problems facing the country, following drug addiction, health care, political dysfunction, and inequality, the survey found (Mitchell et al. 2019).

Public trust in the press directly relates to the accountability level in providing accurate, balanced, fair, and timely information. The press

often does not thoroughly follow through on stories and topics that may have an impact on members of the society they serve. For instance, cases of corruption, major administrative or government errors, and environmental problems are found all over the USA where the news media missed earlier opportunities to alert and inform the public. As an example, the Michigan news media lacked accountability during the 2014–2019 Flint water crisis in which untreated river water caused significant health and developmental problems for children and vulnerable populations who were unaware that lead from pipes was contaminating their drinking water. In that situation, it took a long time before the news media reported on the problem to residents of the Black-majority city. To be trusted, news organizations should pay close attention and report on issues that matter to or affect society.

Given the new power of dissemination of social media, journalists should clarify and correct misinformation or disinformation. The Society of Professional Journalists Code of Ethics states that to seek truth and report it are paramount to the profession. To win the war against misinformation and disinformation, journalists must be accountable and transparent about their own information. However, it is difficult for ethical journalists to compete with computers generating information with wide and fast formats of dissemination. In dealing with misinformation provided by the press, it is vital for news organizations to clarify and correct errors and “false acts” as soon as they are detected. That way, credibility and trust can remain attached to the name of the news organization.

News media journalism’s codes of ethics should include when and how to share information, not only where the stories need to be, but also if reporters need to share parts of their story through their social media professional account. Ethical norms also should be clear about when and how journalists should respond to comments on social media. While some comments provide positive feedback that add context to a story, in many cases the reactions are aggressively negative and switch the discussion to ideology or political positions. Such aggressions can be

related personally to a reporter’s gender, age, race, or ethnicity with minimal connection with the story content. In addition to such negative responses, journalists also worry about the perceived reduction of credibility in their stories if there is a significant number of critical interactions with readers and other users (Naab et al. 2020). In such situations, codes of ethics should establish formats for responses for journalists to follow when they are unfairly attacked and criticized.

Another ethical and legal risk has emerged as automated journalism increases the risk of algorithmic libel. This represents potential pitfalls for the press as more news outlets use apps that could produce and disseminate potentially defamatory content. News organizations should recognize – and prepare for the reality – that software that generates news products could create erroneous content that has not been curated or reviewed by newsroom staff (Lewis et al. 2019). Converting big data into narrative texts is common in some newsrooms especially for sports and financial stories, but “reporting” on other topics important to society may soon become automated as well as targeting audiences more efficiently.

## **Misinformation and Disinformation in the News Media**

Misinformation and disinformation have come to the upfront of news production and distribution with the rapid flow that is facilitated by new digital formats. The two terms are different; at the core, the distinction relates to the intentionality of the stories’ content. By identifying the purposes or intentions of reporters and editors in generating and disseminating a particular story, the distinction between the two terms becomes clear. Misinformation is inaccurate content in a story that results from honest mistakes, errors, unconscious biases, unchecked facts or sources, or neglect by newsroom staff. The press has always dealt with a variety of forms of misinformation, but, for the most part, it been produced and provided unintentionally. Because of the time-pressures of the 24/7 news cycle, stories

often are posted, printed, or broadcast with incomplete data and without double-checking their facts and other content. Other forms of misinformation appear when content is uncertain, vague, unclear, and ambiguous, which can lead to multiple interpretations.

Acknowledging errors and correcting them promptly and prominently are essential to gain or regain audiences' trust. In cases when corrections and clarifications are needed, they must be carefully and clearly crafted to avoid the impression of any type of intentionality. Ethics classes in all accredited US schools of journalism teach students to never deliberately distort facts or content, including visual information that is easy to modify. The pedagogical training students receive familiarizes them with situations where ethics were compromised because of the pressures of deadlines, or because a story is confusing or ambiguous. In addition, students are exposed to the strict, but sometimes overlooked, ethical norms of attribution to give proper recognition to sources' statements.

Disinformation, on the other hand, is purposely created to mislead; in other words, the information is deliberately deceptive. There is nothing new about dissemination of intentionally false news. Historically, there is ample evidence that false news was produced to influence decisions, shift agendas, and discredit or credit people or organizations through knowingly false information. In the USA, commercialization of the news media from its start had some negative effects, including disinformation based on competition among newspapers. In other situations, the political affiliation of a news outlet's owner determined the orientation of stories facilitating the discrediting of or attacks on political opponents. The concept known as "disinformation" has been evident for hundreds of years. In the USA, it bloomed during the partisan press era and as an element of "yellow journalism" at the end of the 1800s when dissemination of false information led to the Spanish-American War of 1898 (Freedman 2019).

False facts dissemination encompasses several types of content under the label of "fake news," including false news, satire, and even intentional misreporting. Yet the term "fake news" has been increasingly used by politicians, particularly

during the 2016 presidential election, by then-candidate Donald Trump. During that campaign, Trump repeatedly downplayed or belittled any information put out by news outlets that did not support his political or personal positions. Fake news no longer refers simply to false information; even opinion-editorial pieces and letters to the editor are being labeled "fake news" in a partisan sense. Commentary, opinion, and feature writing can sometimes be confused with hard news because of the constant 24/7 news cycle. The demand for permanent "breaking news" intensifies the need to fill time, while distinctions between news and commentary get blurred. In some cases, the intent is to produce confusion since there is no clear statement identifying when opinion is provided and when facts are given. Commentary and analysis should be identified as such, and commentators should remain independent and nonpartisan (Tandoc et al. 2017).

Journalism ethics and media law scholars consider that for content to be considered fake, the content creator must have a deceitful intent. However, the 24-h news cycle and social media environments generate a constant stream of news that requires journalists to catch up at two levels. The first is to determine what is real and what is not, and the other is to decide if a story requires further engagement. At times, the pressures of speedy news dissemination also prompt looser standards for journalists who do not have enough time to fact-check information; their sources may include one-sided sources who often seek to provoke controversy, bigotry, public distrust, political action, and even violence. The expectation of news platforms, such as Facebook and Twitter, that their users are able to detect false information themselves based on their own knowledge is seriously flawed. The so-called collective intelligence and crowd wisdom is an idealistic notion that has real-world limitations based on knowledge gaps, education levels, and media literacy. So, the responsibility falls back on journalism as an institution to inform the public about important issues and to provide accurate information to help the citizenry make well-informed decisions on political, economic, social, environmental, and health issues. Ultimately, a well-informed society bolsters the process of debunking disinformation.

## Challenges of News Organizations to Inform Through Digital Platforms

The role of ethical journalism in the new and quickly evolving social media environment is to ensure that shared information in news stories is reliable, objective, and accurate. Challenges to achieve that goal are as vast as automated journalism and other algorithmic apps that can produce and distribute news stories. One major challenge facing newsrooms is timely detection, scrutiny, and unraveling the content of information in social media to determine if it includes errors and if that information is “real” or false.

Social media has become one of the main outlets for disseminating news and for exchanging and sharing information and ideas, yet existing regulations to protect the public from false information are inconsistent and anemic. Meta, the parent company of Facebook and Instagram, has started to implement methods to mitigate the spread of misinformation and disinformation by marking posts with a warning label to alert users of false information that has been reviewed by independent fact-checkers (Lewis et al. 2019). However, existing policies and technologies are not strong enough to prevent false information from reaching further because social media users still can dismiss such warnings and can read, share, and respond to troublesome and troubling content. The major flaw of this model is that Meta relies on algorithms to detect false information from big data while the role of human teams to oversee the detection process has been reduced.

Social media algorithms determine the personal preferences, including political leanings, based on the user postings. Then automated apps select a newsfeed based on their profile (Lewis et al. 2019). For example, when a user engages with content that includes negative opinions about the COVID-19 vaccine, posts reflecting the same ideologies will show up in their feeds. In the case of more radical antivaxxer positions, the algorithm selects similar newsfeeds and sites that match a user’s level of opposition to vaccination. In these circumstances, algorithm-based filter bubbles can amplify and isolate perspectives, viewpoints, and narratives that spread

misinformation and create ecosystems of information that exclusively fits a user’s political views.

The 2016 American presidential election was flooded with misinformation and disinformation, especially in social media, and created sufficient confusion to affect the final electoral results (Ferrara 2020). This is an example of journalism intersecting with social media companies to require identity verification strategies in an effort to control the creation of “bot” and “troll” applications, especially accounts, that disseminate disinformation. Bots are automated application that spread content without human involvement, while trolls are apps and accounts created by humans to spark conflict or disseminate false information (Baroan 2018). Both types of fake accounts are widely considered responsible for spreading false information to sway public opinion by trending in actual important issues such as the 2016 presidential election and the COVID-19 pandemic. For instance, a research group discovered bots sharing conspiracy theories and links to a controversial Danish study on the effectiveness of wearing masks across multiple public Facebook groups. While the original research article concluded that the benefits of wearing a mask were inconclusive, antimasking groups spread a different interpretation through links that appeared in multiple posts within a matter of seconds, proving that they were automated by software (Abbasi 2020). These are the types of challenges that newsrooms should confront to clarify and accurately inform their audiences. Determining not only what information is false, but also who or what is behind those algorithms and accounts, is essential to bring light to what is real and truthful.

Using algorithms to make news judgment should be separated from the role that human editors and other newsroom professionals play to determine newsworthiness. We now know that technology is not as objective as once believed, since an increase in the number of clicks on a story can lead to the questionable assumption that the news is real and ready for wide distribution. As automated journalism grows, the need for preface, context, and interpretation is more critical. After all, a story is not just a compilation of words and numbers, but a narrative that helps the public better understand issues. Fact-checking is one

necessary function, but expertise in journalism is also essential to clarify and explain the meaning of data and facts (Carlson 2018).

Dissemination of false information and “fake news” as a global phenomenon leads to a misinformed or disinformed public with real-life, tangible effects (Horne 2021). It is evident that fake news transcends the digital arena and enters the real world when users take real-life action, such as voting for one candidate rather than another and choosing not to get vaccinated against the coronavirus. Aside from informed discussions and decision-making on public issues, automated journalism raises concerns about the legal concept of actual malice in future libel lawsuits. Identifying the actors behind algorithms is important in determining who may be liable for defamation or other violations of ethical and legal standards. This is a complex issue that policymakers should take seriously to create ways to flag and identify false information disseminators. Social media is not disappearing; on the contrary, it will continue to expand and use sophisticated algorithms that could elude human detection. Moreover, it is far too ingenuous to expect multinational social platforms such as Google, Meta, Amazon, and Apple to effectively self-regulate to detect and flag misinformation and disinformation. The challenges are on multiple levels with various actors, some of them nonhuman; yet, what is at stake is the future of a well-informed society that keeps democracy strong.

## Modern Biotechnology, Agriculture, and Ethics

Per Sandin<sup>1</sup> and Zoë Robaey<sup>2</sup>

<sup>1</sup>Swedish University of Agricultural Sciences, Uppsala, Sweden

<sup>2</sup>Wageningen University, Wageningen, The Netherlands

## Synonyms

Agricultural applications of biotechnology and ethics

## Introduction

Throughout history, agriculturalists have propagated plants and animals selectively, allowing

those with the most desirable traits – high yield, better taste, and so on – to reproduce. Since the mid-nineteenth century, the advent of systematic knowledge of heredity (the science of genetics) has allowed the development and adoption of more modern breeding technologies. In plant breeding, mutagenesis, where chemicals or ionizing radiation is used for generating more genetic variation in the plant material for the breeder to choose from, has been in widespread use for about a hundred years. Other examples are chemically induced doubling of chromosomes (that may result in larger plants), cloning, and artificial insemination. Echoing developments in other industries, breeding of both plants and animals has also become more specialized, professionalized, and commercial, so much of what once was primarily a matter of farmers' practical work has moved into the laboratories of universities and commercial seed or animal breeding companies.

In the 1970s, molecular technologies for altering the genetic makeup of microorganisms, and subsequently other organisms, became available. These technologies may be called *genetic engineering*. The first genetically engineered plants appeared in the early 1980s: they were developed using *transgenesis*, where genes from another organism are inserted into the genome of the plant. Plants developed in this way have been commercially grown since the 1990s. Among them are herbicide-tolerant soybean, papaya that is resistant to the ringspot virus, and so-called BT plants that produce their own insecticide, for instance, BT cotton and BT corn (maize). The molecular toolbox of genetic engineering has grown since then and now includes new technologies for “gene editing” (Lehrman 2020). For instance, CRISPR technology, first presented in 2012 and awarded the Nobel Prize in chemistry in 2020, has been employed in the development of agricultural plants, with the first US-approved gene-edited food being a non-browning mushrooms.

Agricultural applications of biotechnology raise several ethically loaded questions about human health, the environment, relationships between human beings, and relationships between humans and nature. This discussion has been intense in recent decades. It has focused

disproportionately on certain technologies of genetic engineering, including transgenesis. Those technologies are often referred to as technologies for genetic modification (GM). As a result of this debate, agricultural biotechnology – GM in particular – is subject to regulation. These regulations are different in different jurisdictions, with the European Union (EU) having a notably strict regulation of GM including pre-market approval and labelling requirements.

This chapter gives an overview of the most prominent arguments regarding the desirability and permissibility of agricultural biotechnology in relation to the most prominent points of debate: (1) benefits, risks, and uncertainties, (2) justice and fairness, and (3) whether what is sometimes perceived as “tinkering” with living organisms is intrinsically wrong. The focus is on plants for food production, directly or indirectly (in the form of animal feed). It should also be noted that plants also are sources for producing fiber, such as cotton or hemp, and biofuels. There are also applications of these technologies to animals, such as pigs and salmon, but this presentation is limited to plants and microorganisms. Applications in medicine are also excluded.

## Benefits, Risks, and Uncertainties

The main reason for adopting agricultural technology has been the perceived benefits of the applications. For the products launched during the first decades of the era of agricultural biotechnology, those benefits have primarily been agronomic, such as insect resistance or herbicide tolerance. Growers have adopted the products with the aim of rationalizing cultivation and increasing profit, and seed and technology companies have been able to make money from selling seed, chemicals, and other products within a regime of intellectual property rights (Schurman and Munro 2010). In moral terms, the arguments in favor of these practices have largely been consequentialist, that is, they have been justified with reference to the benefits they provide, outweighing possible negative consequences, for instance, to the environment and human health.

Consequentialist arguments have also been levered *against* the desirability of agricultural biotechnologies, arguing that at least for some technologies and applications, the risks outweigh the benefits. Here, for instance, potential harm to sustainability beyond national borders might come in conflict with economic benefits (Myskja and Myhr 2020). This illustrates two complications of consequentialist arguments in relation to agricultural biotechnologies: where do you stop the boundaries of the assessment, and why do you prioritize certain values over others? Furthermore, consequentialist arguments run into trouble in situations of *uncertainty* – that is, when the probability of an outcome is not known or cannot be reasonably estimated (as opposed to situations or *risk*, where such probabilistic knowledge is available). Instead, another line of arguments states that even if we do not know something to be harmful, it might be, and thus we should abstain from using it or introduce it with caution. This is the rationale for the precautionary principle (Ahteensuu and Sandin 2012), and it was applied in the early days of GM research when scientists adopted a voluntary moratorium on certain types of research until more evidence became available.

## Justice and Fairness

Other arguments are not directly concerned with possible harms and benefits but with fairness and justice. In the development end of the food chain, it has been argued that much of the legislation around GM is unfair, since it singles out products developed with GM by imposing regulations on them, even though they might be qualitatively alike in morally relevant aspects to traditionally developed products. It is argued that this violates a basic requirement of fairness, in the sense of non-discrimination: Cases that are alike should be treated alike.

This is an important issue as the use of technologies has drastically transferred the expertise and labor of seed production from farmers to seed breeding companies and agrochemical businesses. End-users, like growers, small-scale farmers, and subsistence farmers, find themselves

depending on this industry. It has been suggested that when considering issues of justice and fairness for agricultural biotechnologies, five challenges should be addressed: *availability, accessibility, participation in science and governance, arbitration, and long-term sustainability* (Robaey and Timmermann 2018). Considering these issues at early stages of technology and product development can support a desirable implementation and diffusion of agricultural biotech innovations.

Justice and fairness arguments are also apparent at the other end of the food chain, in consumption. Here, they often tend to focus on individual consumers. These arguments belong in a liberal tradition: they do not take a stand on the permissibility of agricultural biotechnology but instead state that it should be clearly indicated which products contain biotech ingredients made using biotechnology, enabling consumers to choose. This stance has inspired popular movements like Right to Know in the USA. One way to deal with this is labelling (Hansson 2019). Note that whether a food product contains GM or not is a so-called *credence attribute* of the product – there is no way for the consumer to judge whether the product possesses the attribute (as opposed to, e.g., its color or taste). In some jurisdictions, such labelling is legally required, for instance, in the European Union. The moral arguments in favor of such labels are of two kinds: one kind treats freedom of choice as instrumentally valuable, in the sense that it is seen as the best way of ensuring that people make good choices. The other kind regards freedom of choice or respect for personal autonomy as valuable in itself. The other side of the coin can be that if GMOs are perceived negatively but at an interesting price point, it could accentuate issues of food justice.

## Tinkering or Designing?

A final set of concerns has to do with perceptions of intrinsic wrongness – that there is something wrong with agricultural biotechnology *per se*. Versions include that such technologies amount to “playing God”, that they are unnatural, or that

they involve impermissible fiddling or tinkering with life. These concerns would apply, first, for developers of biotechnology and thus be an issue of research and design ethics. Second, the concerns would apply to consumers, with the worry that tinkering with food at the level of DNA might be equivalent to being “unnatural” (Siipi 2015), or there might be a religious basis for unease with some experience with GMOs. Proponents of GMOs as unnatural have a specific conception of nature based on their values.

However, what might be seen as “tinkering” on one perspective can be seen as sensible, responsible design on another. This further underlines the value-ladenness of agricultural biotechnology (van den Belt 2015). In any technology, innovations are not made in a vacuum: they represent a series of choices of a designer and create value-based reactions from consumers and users. The methodology of value-sensitive design is increasingly used in the field of biotechnology, inviting designers to make technological choices that reflect important stakeholder (or public) values, thereby involving stakeholders in the design process. Acknowledging that values can enter the design of innovations in agricultural biotechnology provides another perspective: agricultural biotechnologies can be not only technically designed for beneficial agronomic properties but also for properties that fulfill societal values. For instance, there is much research done in order to provide biotechnological options to fulfill values of human and environmental safety. What “safety” means will vary depending on stakeholders and use cases, thereby inviting designers in biotechnology to consider a variety of safety mechanisms. Engaging with the practice of biotechnology as designing for value in seeds, or microorganisms, could also help address potential value tensions. For instance, a value like energy security might come at odds with one of food safety (as in the famous “food vs. fuel” debate). What design choices can be made differently to avoid this tension? Using this approach invites questioning the goals of the agricultural biotechnology innovation and encourages making socially relevant decisions and further underlines

how different understandings of value relate to arguments on agricultural biotechnology.

## Conclusion

The concerns regarding the desirability and permissibility of agricultural biotechnology that have been considered here have fallen into three categories: (1) concerns about consequences, risks, and benefits, (2) fairness or justice related concerns, and (3) concerns about intrinsic properties. The list is certainly not exhaustive (some further examples can be found in Gregorowius et al. 2012).

Agricultural biotechnologies offer many promises and present problems relating to different important societal values. Practitioners engaging with such technologies need to be aware of these issues in order to address them at early stages of development. One example of how this is happening is adoptions of methodologies like that of value-sensitive design.

## Modern Slavery in Global Supply Chains

Justine Nolan

Australian Human Rights Institute, UNSW  
Sydney, Sydney, NSW, Australia

### Synonyms

Developing nations and labor; International Labor Rights; Slave labor

### Introduction

Global supply chains have, for many, become synonymous with human rights abuses. While a globalized economy has generated millions of jobs over the last quarter century, lifting hundreds

of millions of people out of extreme poverty, the spread of these ubiquitous supply chains has come at a cost. Global outsourcing has become a central feature of today's globalized economy, and reliance on diversified and often opaque supply chains has given rise to major human rights accountability challenges (Mayer and Gereffi 2010; ILO 2016). Exploitative labor practices have developed persistently over time and continue to do so by cleverly adapting to social and economic changes (Datta and Bales 2013). The shift in production from the developed to the developing world, combined with highly fragmented global production networks, has had profound effects on the nature of modern global manufacturing and the lives of the workers involved in producing the goods (Mayer and Gereffi 2010; Locke 2013).

Modern slavery is a global problem. It is estimated that more than 40 million people are trapped in modern slavery (ILO and Walk Free 2017). The ILO estimates that forced labor in the private economy generates US\$150 billion in illegal profits each year (ILO 2014). Regular revelations about modern slavery show that this practice can reach into every aspect of a company's operations and supply chains, as well as into consumers' lives through our daily consumption and it poses uncomfortable truths for businesses and individuals (Datta and Bales 2013; Nolan and Boersma 2019). There is growing recognition of the need to address this problem and avoid forced labor and related practices that can and do occur in modern business transactions.

### Modern Slavery

There is no globally recognized definition of modern slavery. It is an umbrella term that incorporates a range of serious exploitative practices that includes trafficking in persons, slavery, servitude, forced marriage, forced labor, debt bondage, deceptive recruiting for labor or services, and the worst forms of child labor and is visible in many global supply chains (ILO and Walk Free 2017). Each of these terms is defined in treaties of the United Nations and the International Labor Organization.

Modern slavery is best understood as existing on a continuum of exploitation (Nolan and Boersma 2019). Such an outlook recognizes that people can be exposed to working conditions that gradually worsen, sometimes leading to slavery or slavery-like conditions. As Lewis et al. (2015) argue, while some individuals “enter labour situations that from the outset feature highly adverse conditions of little or no pay, debt or threats, [others] enter work on the expectation or promise of decent pay and conditions but find themselves in increasingly constrained and deteriorating circumstances that close down avenues for exit.”

Modern slavery occurs in every region of the world in both developing and developed countries (ILO and Walk Free 2017). Women are disproportionately affected (accounting for 71% of the estimated 40 million victims) and one in four victims of modern slavery are children (ILO and Walk Free 2017). Forced labor is a form of modern slavery often considered most relevant to workplace exploitation in global supply chains. Forced labor is defined in ILO Convention No. 29 on forced labor and refers to work that people must perform against their will under the threat of punishment. Of the 25 million people estimated to be working as forced laborers, 16 million of these are working in the private economy and half of those are experiencing debt bondage (where individuals work to pay off a debt while losing control over working conditions and repayments) (ILO and Walk Free 2017). Modern slavery is found in a range of sectors including (but not limited to) domestic work, manufacturing, construction, mining, agriculture, and fishing (Datta and Bales 2013; Crane et al. 2019).

## Supply Chain Responsibility

Globalization has hastened a shift in the manner in which business is conducted – from largely being confined within the borders of individual states to hierarchal transnational companies, and, ultimately, to large transnational fragmented global supply chains (Mayer and Gereffi 2010). Trade, production, investment, employment relations, and labor itself have drastically changed with the

growth of supply chains. The United Nations Conference on Trade and Development (2013) estimates that approximately 80% of international trade can now be linked to the global production networks of multinational enterprises. Increasingly, companies do not generally own or operate the end factories in which their goods are produced and they may contract with hundreds, sometimes thousands, of different suppliers annually. Such fragmentation is not a spontaneous process, “but rather a business strategy to facilitate success” (LeBaron 2014).

The supply chain is an area of potential commercial (including reputational) risk for companies. It is increasingly recognized that “one of the most significant and growing liabilities from which firms are attempting to distance themselves is that of forced labor” (LeBaron 2014). Evolving acceptance of a company’s responsibility to respect human rights as set out in the UN Guiding Principles on Business and Human Rights (Human Rights Council 2011) is making it more difficult for companies to disassociate themselves from human rights abuses, such as modern slavery, which business may be causing, contributing, or directly linked to.

Crucially, companies that source through supply chains do not have responsibilities towards workers at suppliers and subcontractors in the same way as they do towards their own employees (Mares 2018). The supply chain has become an intrinsic part of the lead firm’s operations but is generally comprised of separate legal entities. Many of the business relationships present in a supply chain will lie beyond the formal legal bounds of the corporate enterprise. Even though subcontractors, both authorized and unauthorized, may potentially be linked to those companies that are situated at the apex of the global supply chain, the terminology of the UN Guiding Principles on Business and Human Rights does not directly attribute legal liability to the lead company for the activities of its supplier. Further, while the corporate responsibility to respect human rights applies to every company along the supply chain, in practice, corporate responses and interventions will vary based on factors such as risk assessment analysis and the potential leverage of a company

to address the specific human rights issues (Human Rights Council 2011).

## Regulating Modern Slavery in Supply Chains

The application of human rights standards to global corporate operations has largely relied on self-regulation by business, alongside the coercive voice of civil society (Choudhury 2016; Muchlinski 2003). The utility of these voluntary initiatives has not been so much their ability to act as a tool of legal accountability but rather, to engage with companies and enable them to better understand the contemporary responsibilities of business with respect to human rights. Writing in 2008, then United Nations (UN) Special Representative for Business and Human Rights, John Ruggie noted that “the root cause of the business and human rights predicament today lies in the governance gaps created by globalization – between the scope and impact of economic forces and actors, and the capacity of societies to manage their adverse consequences” (Human Rights Council 2008).

The principal challenge is to ensure that the standards espoused in laws, codes, or guidelines directed at business are consistent, comprehensive, and implemented. It is clear not only that substandard working conditions are a global problem but that regulating and improving working conditions in global supply chains is a work in progress. Multiple motives (including reputation protection), pressure points (governments, media, trade unions, nongovernmental organizations (NGOs), consumers, workers, investors), and internal leadership within some companies have influenced, and continue to influence, corporate approaches to improving compliance with human rights standards (Nolan and Boersma 2019). What remains is disagreement about the most effective means of advancing respect for and compliance with international human rights and labor standards.

The relatively recent development of state-based legislative initiatives that focus on generating greater transparency in supply chains

is starting to change this dynamic and hardening human rights requirements for business. What is less clear is whether such disclosure and due diligence requirements can link transparency with accountability and generate substantive (not just procedural) human rights compliance.

Recent legislative efforts to address modern slavery in global supply chains have emanated from Australia (Modern Slavery Act, 2018), the United Kingdom (UK) (Modern Slavery Act, 2015), and California (Transparency in Supply Chains Act, 2010) and emphasize corporate disclosure as a means of combatting modern slavery (Mares 2018; Nolan and Boersma 2019). These laws impose reporting requirements on the lead firms in supply chains and are contributing to an evolving understanding of the actions that a company is expected to undertake with respect to the prevention of modern slavery.

Addressing modern slavery in global supply chains is the primary duty of states, but the fragmented nature of supply chains can make cross-border regulation challenging and business is increasingly being called on to play a part in reducing the incidence of slavery. These legislative measures impose corporate social reporting requirements that operate beyond national borders as a means of reducing modern slavery in global supply chains. The rationale behind these types of reporting requirements is that the reputational implications of forced disclosure will compel companies to undertake human rights focused examination of their supply chain practices and thus improve respect for human rights (Mares 2018). Modern slavery disclosure laws aim to harness the power of stakeholders, such as consumers, civil society, workers’ representatives and investors, as regulators and enforcers of the law (Grabosky 2017). However, while these laws harden the expectation that business will conduct itself responsibly, they are ultimately founded on a soft approach to enforcement which is essentially outsourced to the market (Grabosky 2017).

This focus on using transparency as a mechanism to generate improved respect for human rights in supply chains earlier received prominence with the introduction of section 1502 of the US Dodd-Frank Wall Street Reform and

Consumer Protection Act, (2010). With this mandatory reporting provision, US policy makers put business on notice that companies need to be more transparent about their sourcing strategies and mandated corporate social disclosure as a means of achieving this. This law creates a reporting requirement for publicly traded companies in the USA with products containing specific conflict minerals. The purpose of this provision is to provide greater transparency about how the trade in minerals is potentially fueling and funding the armed struggle in the Democratic Republic of the Congo; functionally, it relies on the adverse reputational impact of such a disclosure rather than mandating penalties for actually sourcing minerals from conflict-afflicted regions.<sup>1</sup>

This mechanism of mandatory social disclosure was then applied in the modern slavery space. In 2010, California adopted the California Transparency in Supply Chains Act (CTSCA) (Civil Code Section 1714.43 (also known as Senate Bill 657 (Steinberg) (2009-10)) which came into effect in 2012. The CTSCA requires large retail and manufacturing firms to disclose efforts to eradicate slavery and human trafficking from their supply chains and is another example of mandated corporate social disclosure. The adoption of the UK's Modern Slavery Act in 2015 focused broader global attention on the use of legislative disclosure requirements to address the human rights impacts of business. Section 54 of the UK Modern Slavery Act requires specified commercial organizations which supply goods or services in the UK to disclose information about their efforts to address modern slavery in their supply chains. In 2018, Australia passed its own Modern Slavery Act which follows a similar model to the UK law. However, Australia has benefitted from the lessons learned in the UK (UK Government 2019; Field et al 2019) and its law has addressed some of the shortcomings of the UK Act by including reporting obligations for the

federal government, mandatory reporting criteria, and a government-funded online repository for statements. However, institutionalizing transparency is unlikely to automatically lead to improvements in corporate behavior (Sarfaty 2015). What is key is ensuring that the laws encourage a move toward substantive compliance with human rights rather than simply cosmetic compliance (Krawiec 2003).

Other jurisdictions have adopted different approaches to addressing modern slavery in supply chains. The USA has the Tariff Act of 1930 (s307 amended in 2016) which applies to all US importers and allows the government to apply a temporary withholding or conclusive ban of goods that are suspected to be the result of forced (or child) labor. In addition, the US Federal Acquisitions Regulations (subpart 22.17 amended in 2015) requires qualifying government contractors and subcontractors to certify that they have made efforts to ensure their supply chain is free from forced labor and human trafficking. Failure to comply may result in a termination of the procurement contract. The US Department of Labor issues a public list of products it believes are produced by forced and child labor.

Since 2004, Brazil has published a "dirty list" disclosing companies who have engaged in illicit labor practices who are then banned from accessing any public financing (Ministry of Labor and Employment Decree No. 540/2004). The dirty list is a public register of companies found by governmental inspectors to have forced labor in their supply chains. Companies named on the list are monitored for two years and are also potentially subject to fines. The "dirty list" is reinforced by a further governmental decree (Decree No. 1 150), which recommends that financial bodies refrain from granting financial assistance to companies on the list.

These laws adopt different tactics to address human rights abuses in supply chains but taken together are evidence of a change in regulatory strategy that reflects a growing consensus that corporate actors have a role to play in addressing the human rights impacts of business and that the state has a regulatory responsibility to prevent and redress those abuses. Modern slavery laws though

<sup>1</sup> Section 1502 does impose penalties for not reporting or complying in good faith. Also, the information filed by companies is subject to s18 of the *Securities Exchange Act* 1934 which attaches liability for any false or misleading statements.

currently limited in their design, do have the potential to harden responsible business conduct principles that have traditionally been cast in a soft voluntary format.

### **Mandatory Human Rights Due Diligence: The Next Step?**

Alongside these narrowly focused modern slavery disclosure laws some countries are working on or have developed broader supply chain governance laws that assess human rights risks more generally, not just those associated with modern slavery. These laws incorporate differentiated and varied enforcement frameworks. Two relevant examples are the “duty of vigilance” law passed in France in 2017<sup>2</sup> and the Netherlands Child Labor Due Diligence Act adopted in 2019 (not yet in effect). Since 2010, at least 11 national or regional laws have been approved, or are under consideration, that require companies to report on their supply chain practices and incorporate a broader variety of enforcement mechanisms.<sup>3</sup>

The French Corporate Duty of Vigilance Law 2017 requires large French companies<sup>4</sup> to identify and prevent adverse human rights (and environmental) impacts, including those resulting from their supply chains. Specifically, companies must implement, and report annually on, a “vigilance

plan” to prevent human rights abuses. The plan must assess the company’s human rights risks, as well as risks associated with its subsidiaries, sub-contractors or suppliers with whom the company maintains an established business relationship. Once identified, companies are required to take appropriate action to mitigate risks or prevent serious violations, to create risk alert mechanisms in conjunction with trade unions and monitor and assess the efficiency of its measures. Interested parties may enforce noncompliance with the law through the courts.

The Netherlands has adopted the Child Labor Due Diligence Act that will require companies selling products or services to Dutch end-users to identify whether child labor is present in their supply chain and, if this is the case, to develop a plan of action to address it and issue a due diligence statement.

The French and Dutch laws provide for stronger enforcement measures than the Australian, UK, and Californian modern slavery law. In France, a court may impose an injunction on companies to comply with the vigilance requirements (akin to a duty of care) and companies may potentially be held liable under a civil lawsuit where companies have failed to implement due diligence plans and harm has occurred that can be causally linked to that failure (BHRCC and ITUC 2017). The Dutch law actively involves the regulator in the enforcement framework and provides for a process of due diligence implementation and the potential for fines to be imposed for noncompliance.

The European Union’s 2014 Directive (2014/95/EU), requires companies with more than 500 employees to report on how they manage human rights risks, including modern slavery, in their supply chains. Although the EU Directive does not specifically refer to supply chains, the definition of risk contemplates business relationships that are likely to cause adverse impacts on human rights. Specifically, companies must provide a description of their relevant policies, their due diligence processes, the outcomes of those policies, principal human rights risks, how they are managed, and key performance indicators. The EU Directive is broader than the UK,

<sup>2</sup>LAW No 2017-399 of March 27, 2017 on the Duty of Vigilance of parent companies and instructing companies, JORF No 0074 of 28 March 2017, text No 1. (French Law)

<sup>3</sup>*Tariff Act of 1930*, 19 USC § 1654 (US); *Federal Acquisitions Regulation (FAR)* 48 CFR 1, 22.17 (US), *Child Labour Due Diligence Law 2019* (Netherlands); *Modern Slavery Act 2015* (UK), s 54; *Duty of Vigilance Law 2017* (France); *Dodd-Frank Wall Street Reform and Consumer Protection Act* 12 USC § 1502; *Transparency in Supply Chains Act of 2010*, Cal Civil Code §1714.43; *Conflict Minerals Regulation 2021* (EU), *Responsible Business Initiative* (Switzerland), *Modern Slavery Act 2018* (Cth); *Modern Slavery Act 2018* (NSW).

<sup>4</sup>The law applies to any company established in France with at least 5,000 employees within the company head office and its direct and indirect subsidiaries, whose head office is located on French territory, or that employs at least 10,000 employees within the company and its direct and indirect subsidiaries, whose head office is located on French territory or abroad.

California, and Australian Acts in that it applies to all human rights impacts, not just modern slavery but like those laws, lacks a hard enforcement framework.

On 29 April 2020, the European Commissioner for Justice, announced that the European Council will introduce rules for mandatory corporate environmental and human rights due diligence in 2021 (BICL et al. 2020; Feldman et al. 2020). The announcement is the latest in a series of developments representing a rising tide of human rights and environmental due diligence obligations. The new EU regime will add to existing legal obligations and further codify existing soft law frameworks. It will also be relevant to legal actions for alleged human rights abuses, establishing the standard of conduct expected from companies. However, the enforcement framework remains as yet unclear. In addition, there are several other laws under consideration, including in Switzerland, Canada, Germany, and Hong Kong, that focus on supply chain responsibility (BHRCC and ITUC 2017).

## Aligning Purpose and Profit

Calls for companies to adopt a more purposeful approach to business including one that includes greater transparency and responsibility for issues such as modern slavery are growing. In 2019, the US Business Roundtable issued a Statement on the Purpose of a Corporation in which it acknowledged that companies must consider their impact on customers, employees, suppliers, and the communities in which they operate. It also suggests a degree of leverage on the part of the lead firm to influence the conduct of the supplier to ensure fair working conditions (Mayer and Gereffi 2010).

Also in 2019, Larry Fink, CEO of Black Rock, the largest asset management company in the world, called on business leaders to consider the purpose of their company. “Purpose is not a mere tagline or marketing campaign; it is a company’s fundamental reason for being – what it does every day to create value for its stakeholders. Purpose is not the sole pursuit of profits but the animating force for achieving them. Profits are in no way

inconsistent with purpose – in fact, profits and purpose are inextricably linked. Profits are essential if a company is to effectively serve all of its stakeholders over time – not only shareholders, but also employees, customers, and communities. Similarly, when a company truly understands and expresses its purpose, it functions with the focus and strategic discipline that drive long-term profitability” (Fink 2019). Fink argues that business should proactively address socioeconomic issues.

Such public statements about the breadth, depth, and interdependent nature of supply chains are now a more common occurrence and a far cry from the narrower perspective and “denial of responsibility” approach of companies just a few decades earlier to human rights abuses in their supply chains (Ratner 2001). However, to address modern slavery in a substantial rather than cosmetic way, it is necessary to establish a legal framework that requires (not requests) compliance and for business to adopt a purposeful mindset that is reflected in their business model and supply chain operations.

## Monetary Wisdom: A Measure of Attitude Toward Money – Constructs and Items

Thomas Li-Ping Tang

Department of Management, Jennings A. Jones College of Business, Middle Tennessee State University, Murfreesboro, TN, USA

### Synonyms

Aspiration for money; Attitude toward money; Behavior; Behavioral intentions; Business ethics; Greed; Items; Love of money; Meaning of money; Measurement scales; Monetary wisdom; Outcome variables/constructs; Prospect theory; Risk averse; Risk seeking; Theoretical model

### Introduction

According to Mitchell and Mickel (1999), Tang's money-related construct (the Money Ethic Scale and the Love of Money Scale) has become one of the most well-developed and systematically used constructs of money attitude in the literature. This money-related construct is associated with

financial risk-tolerance (Tang et al. 2008a), risk-taking behavior in an ERP study (Jia et al. 2013), and mildly associated with materialism (Belk 1985; Gentina et al. 2017, 2018b; Kasser 2002; Tang et al. 2014). The love of money results in objectification (Wang and Krumhuber 2017) which reduces personal intimacy. The love of money also creates a winner-take-all mentality – the Matthew effect<sup>1</sup> (Merton 1968; Tang 1996; Tang et al. 2003), contributes to our understanding of pay satisfaction (Luna-Arocas and Tang 2015; Tang et al. 2004, 2005, 2006b). It predicts dishonest intention and actual cheating behaviors in experiments (Chen et al. 2014), college students' poor grades in a business course (Tang 2016), stock happiness (Tang et al. 2018), and voluntary turnover 18 months later (Tang et al. 2000). The love of money (LoM) is consistently stronger than the theory of mind (ToM) in predicting unethical consumer beliefs (Gentina and Tang 2018) among French teenagers.

## Research Findings

Scholars have substantiated the relationships between the love of money and several outcome variables in more than 43 countries across six continents. Some outcome constructs may include unethical intentions (e.g., Erdener and Garkavenko 2012; Gbadamosi and Joubert 2005; Kashif and Khattak 2017; Nkundabanyanga et al. 2011; Tang and Chen 2008; Tang and Chiu 2003; Tang and Liu 2012; Wicaksono and Urmsah 2016), consumer unethical beliefs, or consumer ethics (Gentina and Tang 2018; Gentina et al. 2017, 2018b; Rose 2016; Rose et al. 2016; Singhapakdi et al. 2013; Vitell et al. 2006, 2007), helping behavior (Tang et al. 2008b), and pay and life satisfaction (Tang et al. 2006a, b, 2018a, b).

In addition to several cross-cultural studies (Tang et al. 2006a, b, 2008b, 2018a, b), scholars have applied the love of money construct in

numerous countries around the world, e.g., Czech Republic (Lemrová et al. 2014), Indonesia (Wicaksono and Urmsah 2016), Kazakhstan (Erdener and Garkavenko 2012), Macedonia (Sardžoska and Tang 2015; Tang et al. 2004), Malaysia (Wong 2008), Pakistan (Kashif and Khattak 2017), Singapore (Lim and Teo 1997), Swaziland (Gbadamosi and Joubert 2005), Thailand (Ariyabuddhiphongs and Hongladarom 2011), Turkey (Süer et al. 2017), Uganda (Nkundabanyanga et al. 2011), and the UK (Wang and Krumhuber 2017). Scholars have cited these constructs in influential reviews (Dittmar et al. 2015; Kish-Gephart et al. 2010; Lea and Webley 2006; Mitchell and Mickel 1999; Wang et al. 2020) and numerous editions of textbooks (Bateman and Snell 2013; Colquitt et al. 2015; Furnham 2014; Gerhart and Newman 2020; McShane and Von Glinow 2021; Milkovich et al. 2014; Newman et al. 2017; Phillips and Gully 2019; Scandura 2019). It has been featured in news media (Bloomberg 2016; CNN: Gillespie 2016; Financial Times: Authers 2016). Additional data are now available from Japan, Ukraine, and other countries.

## A Theoretical Model of Monetary Intelligence/Wisdom

Monetary intelligence/wisdom asserts: Individuals consciously or unconsciously select their deep-rooted personal values (e.g., aspiration for money or love of money, among others) as a part of their executive cognitive functions and frame critical concerns in the proximal (immediate) and distal (omnibus) contexts to maximize expected utilities and ultimate happiness. See relevant articles related to monetary wisdom (Tang et al. 2018a). It is essential that researchers must select theoretically appropriate subconstructs for monetary wisdom and also outcome variables in the immediate (proximal) context and also in the distal (omnibus) context.

To encourage future empirical research and facilitate new explorations, I have presented constructs and items (Appendix A) and a *formative* theoretical model (Fig. 1). Scholars have

<sup>1</sup> For to everyone who has, more will be given and he will grow rich; but from the one who has not, even what he has will be taken away (Matthew 25: 29). The rich get richer and the poor get poorer.

**Monetary Wisdom: A Measure of Attitude Toward Money – Constructs and Items, Fig. 1** A theoretical model of monetary wisdom

examined most constructs in empirical studies (especially the love of money with Factors Good/Important, Rich, Motivator, and Power) but rarely used constructs with negative connotations (Evil and Non-intrinsic). One of the reasons is that research has shown that the items with negative wording and/or reverse-scored items may not fit well with the items with positive wording. Due to recent developments in research methodology, scholars may consider attitudinal measures not only as a reflective model but also

as a formative model (MacKenzie et al. 2011; Podsakoff et al. 2003; Williams et al. 2003). In a reflective model, we treat affective (motive), behavioral (stewardship), and cognitive (meaning) components of money attitude as an imperfect reflection of the underlying latent construct, monetary intelligence (MI). Most importantly, the direction of the relationship flows from the latent construct to the indicators – observed and measured items.

In a formative model, we consider motive, stewardship, and meaning of money, conceptually, as distinguishable perspectives, noninterchangeable defining characteristics, or formative indicators of the monetary intelligence. The elimination of any single subconstruct will restrict the overall construct in a significant way. The direction of the relationship is from subconstructs to the MI construct. The construct is “nothing more than a label for its dimensions considered collectively” (Edwards 2011, p. 384). Since all subconstructs make independent contributions to the overall latent construct (e.g., MI), researchers may use both positively and negatively worded constructs in a formative theoretical model simultaneously (see Tang 2016; Tang et al. 2018a; and Fig. 1).

To achieve model identification (Jarvis et al. 2003), a formative construct must emit paths to at least two unrelated latent constructs with reflective indicators, theoretically appropriate reflective indicators, or one reflective indicator and one latent construct with reflective indicators. The formative theoretical models provide many additional advantages. Scholars may follow suggestions and examples (Gentina and Tang 2018; Gentina et al. 2017, 2018a, b; Tang et al. 2018a) to conduct empirical studies. In summary, future researchers may use formative theoretical models to explore money-related constructs as related to various outcome variables.

## Appendix A

### Affect: The Affective Motive of Money (Why)

#### Good (Important)

1. Money is important
2. Money is valuable
3. Money is good

#### Evil

4. Money motivates people to perform unethically
5. Money is a major cause of people’s unethical and evil acts
6. The love of money (greed) leads to theft, corruption, and murder
7. Money undermines one’s ethical norms and standards
8. The love of money is the root of all evils

#### Rich

9. I want to be rich
10. It would be nice to be rich
11. Having a lot of money (being rich) is good

#### Motivator

12. Money reinforces me to work harder
13. I am motivated to work hard for money
14. I am highly motivated by money

#### Power

15. Money is power
16. Money gives one considerable power
17. Money controls and manipulates your behavior, when you are paid
18. Money can buy the best products and services

### Behavior: The Behavioral Stewardship of Money (How)

#### Make Money

19. I find smarter and better ways of making money
20. I look for new and legal ways to make money
21. I am proud of my ability to make money

#### Budget Money

22. I budget my money very well
23. I use my money very carefully
24. I am proud of my ability to save money

#### Give/Donate Money to Charity

25. I give generously to charitable organizations
26. I believe in charitable giving
27. I give money to the Church (religious organizations)

**Make Contribution: The Matthew Effect**

28. More money should be paid to people with higher quality of performance
29. More money should be paid to people with more talent
30. More money should be paid to people with higher merit (performance)

**Cognition: The Cognitive Meaning of Money (What)****Happiness**

31. Money can buy happiness
32. Money makes me feel happy
33. Money makes life a lot easier

**Respect**

34. Money makes people respect me in the community
35. Money helps me gain respect
36. Money allows me to express myself

**Achievement**

37. Money represents my achievement
38. Money is a symbol of my success
39. Money reflects my accomplishments

**Freedom**

40. Money gives you autonomy and freedom
41. Money can give you the opportunity to be what you want to be
42. Money in the bank is a sign of security

**Nonintrinsic**

43. Money does *not* enhance the “love” of my job
44. Money does *not* make my job exciting, interesting, and challenging
45. Money offers less excitement than achievement on my job

**A 5-Point Rating Scale with Anchors**

|                   |          |         |       |                |
|-------------------|----------|---------|-------|----------------|
| 1                 | 2        | 3       | 4     | 5              |
| Strongly disagree | Disagree | Neutral | Agree | Strongly agree |

## Monetary Wisdom: Prospect Theory and the Meaning of Money (The Love of Money)

Thomas Li-Ping Tang

Department of Management, Jennings A. Jones College of Business, Middle Tennessee State University, Murfreesboro, TN, USA

## Synonyms

Aspiration for money; Attitude toward money; Behavior; Behavioral intentions; Business ethics; Greed; Items; Love of money; Meaning of money;

Measurement scales; Monetary wisdom; Outcome variables/constructs; Prospect theory; Risk averse; Risk seeking; Gains-losses domain; High-low probability of risk; The certainty effect; The possibility effect; Theoretical model

## Introduction

Daniel Kahneman won the 2002 Nobel Prize in economic sciences for having integrated insights from psychological research into economic science, especially concerning human judgment and decision-making under uncertainty. In his 2011 book, *Thinking, Fast and Slow*, Kahneman asserted that “there may also be cultural differences in the attitude toward money” (p. 298) in investigating the endowment effect and behavioral economics. Following his inspiration, this entry’s main purpose is to extend Kahneman’s prospect theory and incorporate attitude toward money in decision-making under uncertainty. Monetary wisdom theory explores decision-makers’ attitudes toward money, the love of money attitude, i.e., an individual difference variable. Individuals frame critical concerns (gains-losses domain and high-low probability) in the proximal and omnibus contexts to maximize expected utilities and ultimate fulfillment. This theory applies to decision-making at individual, organization-industry, and country-global levels.

## Prospect Theory

Daniel Kahneman won the 2002 Nobel Prize in Economic Sciences. Kahneman and Tversky (1979) and Tversky and Kahneman (1974, 1981, 1992) developed their prospect theory. Prospect theory suggests that a rational decision maker prefers the prospect that offers the highest expected utility. Overall, prospect theory frames options in “gains-losses domain” and “high-low probability.” The formation of the problem, the norms, and the decision-maker’s personal characteristics influence one’s decision frame. In his book, *Thinking, Fast and Slow*, Daniel Kahneman stated: “The *fourfold pattern* of preferences is

considered one of the core achievements of prospect theory” (Kahneman 2011, p. 317). So, what is the fourfold pattern of preferences? It involves risk-aversion for gains and risk-seeking for losses in the context of high probability (the certainty effect) and risk-seeking for gains and risk-aversion for losses in the context of low probability (the possibility effect). Kahneman (2011) asserted that “there may also be cultural differences in the attitude toward money” (p. 298) in investigating the endowment effect and behavioral economics (Kahneman et al. 1990; Thaler 2015; Thaler and Sunstein 2008). However, very little research has explored behavioral economics and behavioral ethics from prospect theory’s perspective, involving individual differences – attitude toward money. These suggestions in the literature reveal the profound importance for scholars to focus on the attitude toward money. This entry fills the void, bridges the gaps between prospect theory and behavior ethics, and contributes to the business ethics literature. In short, I expand the prospect theory, incorporate individuals’ deep-rooted values – attitude toward money – to frame decision-making in the gains-losses domain and high-low probability of risk (the prospect theory), and develop my Monetary Wisdom Theory.

## Attitude Toward Money

In economics, money is an instrument of commerce and a measure of value (Smith 1776/1937). From the psychological perspective, the meaning of money is in the eye of the beholder (McClelland 1967, p. 10; Tang 1992, 1993). Therefore, researchers incorporate the attitude toward money in investigating behavioral economics and behavioral ethics.

Numerous priming experiments suggest that thinking about money provokes strong emotions for individuals. Vohs et al. (2006) published an excellent article in *Science* on this interesting issue – thinking about money. Reminding people about money activates feelings of self-sufficiency, reduces requests for help, donates less money to charity, and keeps a large physical distance

between themselves and others (see Welsh and Ordóñez 2014). Furthermore, counting 80 \$100 bills (compared to 80 pieces of paper) reduces people's physical pain (Zhou et al. 2009). The mere presence of abundant wealth, cash, or money provokes a feeling of "envy toward wealthy others." Envy causes a high percentage of participants to engage in and a large magnitude of cheating for personal gains (Gino and Pierce 2009b, p. 142; Gino and Pierce 2009a) and triggers a business decision frame and unethical outcomes (Kouchaki et al. 2013). The love of money also results in objectification, which reduces personal intimacy (Wang and Krumhuber 2017). Due to this objectification mentality, executives at Enron, for example, treated their employees as objects (pawns in a chess game), without any emotions or feelings (Tang et al. 2018a).

Interestingly, getting Harvard, MIT, Yale, and Princeton students to contemplate their own ethical values by recalling the Ten Commandments or signing an honor code eliminates cheating completely, while offering poker chips to redeem for cash, a few seconds later, doubles the level of cheating (Ariely 2008). Reminding individuals about religious values and ethical norms reduces individuals' dishonesty, unethical behavioral intentions, cheating, and dishonesty (e.g., Aquino et al. 2009; Tang 2016). This principle helps the researcher detect lies in handwriting samples (see, for example, Tang 2012). Participants pay attention to the environmental cues, social norms, and the context and proactively adjust their behaviors.

## Monetary Wisdom

Specifically, following Kahneman's (2011) suggestions, scholars pay attention to decision-maker's deep-rooted personal values – the aspiration for money (or love of money<sup>1</sup>, greed, in layman's terms) as related to behavioral economics and behavioral ethics. We frame relationships between the aspiration for money and behavioral

ethics in a brand-new perspective of the gains-losses domain and high-low probability.

Following the prospect theory, my coauthors and I developed the notion of Monetary Wisdom in a series of articles. Monetary intelligence asserts: Individuals select their deep-rooted personal values (aspiration for money or love of money) to frame critical concerns in the proximal (immediate) and distal (omnibus) contexts to maximize expected utilities and ultimate happiness (e.g., Chen et al. 2014; Chen and Tang 2006; Chiu and Tang 2015a, b; Gentina et al. 2018; Lemrová et al. 2014; Sardžoska and Tang 2015; Tang et al. 2014, 2018, a; Tang 2016; Tang and Chen 2008; Tang and Chiu 2003; Tang and Sutarso 2013).

In short, on the bright side, *low* aspiration for money predicts ethical decision-making, high academic achievement (Tang 2016), and stock happiness (Tang et al. 2018b). On the dark side, *high* aspiration predicts dishonesty in panel studies (Tang and Sutarso 2013), cheating (Chen et al. 2014), and voluntary turnover 18 months later (Tang et al. 2000). These findings support the notion of monetary wisdom. I encourage readers to study all these articles and related entries in this *Encyclopedia of Business and Professional Ethics* to understand these exciting constructs among various contexts.

## Monetary Wisdom: The Attitude Toward Money and the Meaning of Money (The Love of Money)

Thomas Li-Ping Tang  
Department of Management, Jennings A. Jones  
College of Business, Middle Tennessee State  
University, Murfreesboro, TN, USA

### Synonyms

Aspiration for money; Attitude toward money; Behavior; Behavioral intentions; Business ethics; Greed; Happiness/Subjective Well-Being (SWB); Items; Love of money; Meaning of money; Measurement scales; Monetary wisdom; Outcome

variables/constructs; Prospect theory; Risk averse; Risk seeking; Theoretical model; Ultimate fulfillment

### Introduction

This entry briefly reviews the literature on the theory of planned behavior and the ABC (affective, behavioral, and cognitive) model of attitudes. Following the ABC model, this entry also provides a short history for the development of the Money Ethic Scale, the love of money measure, and the notion of monetary wisdom. This entry also tapes on empirical studies related to the measurement scale's reflective and formative models and monetary wisdom.

### Monetary Wisdom

Monetary Wisdom (MW) asserts: Individuals select their deep-rooted personal values (aspiration for money or love of money) to frame critical concerns in the proximal (immediate) and distal (omnibus) contexts to maximize expected utilities and ultimate happiness (e.g., Chen et al. 2014; Chen and Tang 2006; Chiu and Tang 2015a, b; Gentina et al. 2018; Lemrová et al. 2014; Sardžoska and Tang 2015; N. Tang et al. 2018; Tang 2016; Tang and Chen 2008; Tang and Sutarso 2013; Tang et al. 2018a, b). This theory applies to decision-makers at the individual, organization-industry, and country-global levels. Now, I trace Monetary Wisdom (MW) back to the development of the measurement scales.

### Attitude Toward Money

In the psychology literature, the theory of planned behavior (TPB) (Ajzen 1991) asserts that attitudes, subjective norm, and behavioral control predict *behavioral intention* that, in turn, predicts *behavior*. There are numerous money-related constructs and measures (e.g., Furnham 2014; Mitchell and Mickel 1999; Srivastava et al. 2001; Wernimont and Fitzpatrick 1972; Yamauchi and Templer 1982; Zelizer 1989). Following the

ABC (affective-behavioral-cognitive) model of attitudes, Tang and his associates developed several new constructs in a series of studies on the attitude toward money and the meaning of money. Following the notion of the work ethic and the leisure ethic (Grant 2008; Tang and Baumeister 1984), Tang developed the Money Ethic Scale (Tang 1992, 1993). The Money Ethic Scale consists of the following (ABC) constructs: Affective: Money is Good, Money is Evil; Behavioral: Budget; Cognitive: Money represents Achievement, Respect, Freedom (Power).

Later, Tang and Chiu (2003) developed the Aspiration for Money Scale or the Love of Money (LoM) Scale. Hereafter, researchers have used these two terms, the Avaricious Monetary Aspiration and the Love of Money, or the Love of Money, interchangeably. The Love of Money Scale consists of Factors Rich (affective) (Gino and Pierce 2009a, b), Motivator (behavioral) (Locke et al. 1980), and Important/Good (cognitive) (Mitchell and Mickel 1999). Besides these three constructs, money is also Power in the context of materialism (Lemrová et al. 2014). British politician, Lord Acton's letter to Bishop Creighton (1887) stated: "Power tends to corrupt; absolute power corrupts absolutely."

Tang et al. (2018a) explored additional constructs. The affective component consists of Factors Rich, Motivator, and Important/Good (the love of money, mentioned above). The behavioral component includes how individuals Make money, Budget money, Donate/Give money to charity, Make Contributions (The Matthew Effect) (Merton 1968). Finally, the cognitive component covers the following meaning: Money means Happiness, Respect, Achievement, and Power. I list the major contributions of this newest version of attitude toward money, briefly, as follows.

### Attitude Toward Money and Ultimate Happiness

In a cross-cultural study involving 6586 managers in 32 countries (entities) across six continents, Tang et al. (2018a) compared the reflective model with

the formative model. Researchers concluded that the formative model is superior to the reflective model. Further, scholars frame Monetary Intelligence (MI) in the context of pay satisfaction and life satisfaction, controlling for money at the micro-level (individuals' standardized income (Z income) within each country) and the macro-level (Interestingly, GDP per capita at the country level). They theorize that managers with low love of money motive but high stewardship behavior will have high subjective well-being (SWB): pay satisfaction and quality of life (Please see Fig. 1).

Their research offers the following exciting discoveries and new vocabulary in the conversation of the attitude toward money and behavioral economics. Interestingly, GDP per capita is related to life satisfaction, yet it is not related to pay satisfaction. As expected, standardized income within each entity is associated with both life and pay satisfaction. Surprisingly, neither GDP nor income is related to the Happiness construct (money makes people happy).

The formative theoretical model offers the following new insights: The affective motive is positively related to the stewardship behavior (0.54) and the meaning of money (0.79), whereas the stewardship behavior is also positively associated with the meaning of money (0.43). Among the ABC constructs, all correlations are smaller than 0.80, suggesting no construct duplication and redundancy. After controlling for GDP per capita and income, managers' motive (−0.60), stewardship behavior (0.79), and cognitive meaning (0.19) all contribute significantly and independently to the overall latent Monetary Intelligence (MI) construct. The latent construct of Monetary Intelligence, in turn, is positively related to pay satisfaction and life satisfaction, supporting the theory.

Researchers offer innovative discoveries when exploring the theoretical model using multiple group confirmative factor analysis (MGCFAs) across three GDP groups: In high GDP entities (rich countries), high income not only reduces aspirations—Rich, Motivator, and Power, but also promotes stewardship behavior—Budget, Donate/Give, and Contribute and appreciation of Achievement. These empirical data suggest that

**Monetary Wisdom: The Attitude Toward Money and the Meaning of Money (The Love of Money),**  
**Fig. 1** Results of the Formative Theoretical Model (The Whole Sample) (Source: Tang et al. 2018a)

Factors Rich, Motivator, Important/Good, and Power may work reasonably well together.

We demonstrate the bright side of Monetary Intelligence, i.e., Monetary Wisdom. Low love of money motive but high stewardship behavior define Monetary Wisdom. Good apples enjoy a good quality of life in good barrels. This notion adds another explanation to managers' low magnitude of dishonesty in entities with high Corruption Perceptions Index (risk-aversion for gains of high probability) (Tang et al. 2018b). In low GDP entities (poor countries), high income is related to

poor Budgeting skills and escalated Happiness. Managers experience equal satisfaction with pay and life. Mindfulness (MBSR, Mindfulness-Based Stress Reduction training) reduces individuals' stress, love of money aspiration (greed), and unethical decision-making intentions (Gentina et al. 2020). Consequently, it enhances people's ultimate fulfillment – happiness and subjective well-being (SWB). Following Nobel Laureate Richard T. Thaler (2015, 2018; Thaler and Sunstein 2008), our findings help individuals nudge toward wiser decisions, healthy lives, and great happiness.

## Monetary Wisdom: The Love of Money, ASPIRE, and Unethical Behavioral Intention

Thomas Li-Ping Tang

Department of Management, Jennings A. Jones  
College of Business, Middle Tennessee State  
University, Murfreesboro, TN, USA

### Synonyms

ASPIRE; Authentic Supervisor's Personal Integrity and Character; Avaricious Monetary Aspiration; Business Ethics; Greed; Leader-Member Exchange; LMX; Monetary Wisdom; Moral Leadership; Prospect Theory; Risk-Taking; Risk-Aversion; Servant Leadership; The Meaning of Money; The Love of Money; Trickle-Down Effect; Unethical Behavioral Intentions; Values

### Introduction

Individuals' avaricious monetary aspiration, or love of money, or greed in layman's terms, predicts not only unethical behavior intentions but also actual cheating in laboratory experiments (Chen et al. 2014; Tang et al. 2018a, b; Tang 1992, 1993, 2016, 2020a). Monetary Wisdom (MW) posits that decision-makers select their deep-rooted personal values as a part of their executive cognitive functions and frame the critical concerns in the proximal (immediate) and distal (omnibus) contexts to maximize their expected utility and ultimate serenity (Tang 2020a, b). This entry summarizes another robust and unique construct – ASPIRE. ASPIRE measures employees' perceptions of their Authentic Supervisor's Personal Integrity and Character (Tang and Liu 2012). This construct has nine items and three subconstructs: honesty and integrity, caring servant, and transparent help. Interestingly, this ASPIRE construct moderates the relationship between individuals' love of money (avaricious monetary aspiration) and unethical

behavior intentions and reveals profound discoveries. Therefore, this ASPIRE construct offers novel and counterintuitive theoretical discoveries and robust and practical implications to researchers and practitioners in business and professional ethics.

### Monetary Wisdom

More than half of the parables in the Bible have something to do with money, possessions, and the management of talents (Chen and Tang 2013; Tang and Chen 2008; Chiu and Tang 2015a, b; Tang 2021; Tang and Tang 2010). It is essential to know how we manage our money, possessions, and talents.

Jesus talked about the Parable of Talents in the book of Matthew. "A man who was going on a journey called in his servants and entrusted his possessions to them. To one he gave five talents; to another, two; to a third, one – to each according to his ability" (Matthew 25: 14–16). Following the Parable of the Talents, readers will realize that these three servants' handling of the entrusted possessions tells us an exciting story of their values toward the money, actions, and Monetary Wisdom.

Robert King Merton, who received his Ph.D. from Harvard University (1936) and taught at Harvard, Tulane, and Columbia, published an article in *Science* (1968) and popularized *the Matthew Effect*. So, what is the Matthew Effect? In the Bible, the Parable of the Talents shows the message. "*For to everyone who has, more will be given and he will grow rich; but from the one who has not, even what he has will be taken away*" (Matthew 25: 29). The Matthew Effect is a double-edged sword. It has bright and dark sides: The rich get richer, and the poor get poorer. These servants' actions reflect their Monetary Wisdom.

Researchers have defined Monetary Wisdom as follows. Decision-makers select their deep-rooted personal values as a part of their executive cognitive functions and frame the critical concerns in the proximal (immediate) and distal (omnibus) contexts to maximize their expected

utility and ultimate serenity-happiness (Tang 2020a, b). Serving God will lead us to growth and prosperity. Serving mammon will lead us to death and poverty. It applies to all decision-makers. Of course, that includes all the people around the world. It is also interesting to all readers that the Matthew Effect applies to the individual, group and organization, and country and society levels.

### **Nobel Laureate, Kahneman's Advice: The Importance of the Attitude Toward Money**

Daniel Kahneman (2011) won the 2002 Nobel Prize in Economic Sciences for his groundbreaking work in applying psychological insights to economic theory, particularly in judgment and decision-making under uncertainty (e.g., Kahneman and Tversky 1979; Tversky and Kahneman 1974, 1981, 1992). Prospect theory suggests that a rational decision-maker prefers the prospect that offers the highest expected utility. The formation of the problem, the norms, and the decision-makers' personal characteristics influence one's decision frame. Kahneman (2011) asserted that "there may also be cultural differences in the attitude toward money" (p. 298) in investigating the endowment effect and behavioral economics (Kahneman et al. 1990; Thaler 2015; Thaler and Sunstein 2008).

According to Adam Smith (1937), money is the instrument of commerce and measure of value in economics. Harvard psychologist, David McClelland (1967) argued that the meaning of money is in the eye of the beholder. Following the theory of planned behavior (Ajzen 1991), attitude predicts behavioral intentions and actions. The love of money is the root of all evils (1 Timothy 6: 10). Specifically, following suggestions in the literature (Kahneman 2011; McClelland 1967), scholars pay attention to decision-makers' deep-rooted personal values – the aspiration for money (or love of money, greed, in layman's terms) as related to behavioral economics and behavioral ethics. Researchers frame the relationships between the aspiration for money and

behavioral ethics in a brand new perspective of Monetary Wisdom and decision-making.

### **Decision-Making Involving Monetary Values and Behavioral Economics**

Following the prospect theory, researchers developed the notion of Monetary Wisdom, combined the psychology of money and behavioral economics, and investigated individuals' decision-making. There are several references here. Interested readers can consult these research articles (e.g., Chen et al. 2014; Chen and Tang 2006; Chiu and Tang 2015a, b; Gentina et al. 2018; Lemrová et al. 2014; Sardžoska and Tang 2015; Tang et al. 2014, 2018a, b; Tang 2016; Tang and Chen 2008; Tang and Chiu 2003; Tang and Sutarso 2013). The love of money results in objectification (Wang and Krumhuber 2017; Wang et al. 2020).

Monetary Wisdom and related findings are summarized as follows. First, on the *bright* side, *low* aspiration for money predicts ethical decision-making, high academic achievement (Tang 2016), high pay satisfaction and life satisfaction (Tang et al. 2018b), great stock happiness (NY Tang et al. 2018, 2019), and employees' voluntary turnover 18 months later (Tang et al. 2000). Second, on the *dark* side, *high* aspiration predicts dishonesty in panel studies (Tang and Sutarso 2013) and cheating (Chen et al. 2014). Third, Monetary Wisdom consists of two important outcomes involving expected utility and ultimate happiness. See also Monetary Intelligence (MI) (Tang 2020a, b). Monetary Wisdom affects decision-makers' health-death, happiness, and wealth.

### **ASPIRE**

The mere presence of money causes people to engage in unethical behavior (Gino and Pierce 2009a, b; Kouchaki et al. 2013; Welsh and Ordóñez 2014). Money creates a sense of self-sufficiency (Vohs et al. 2006) and reduces stress (Zhou et al. 2009). Research suggests that getting Harvard, MIT, Yale, and Princeton students to

contemplate their ethical values by “recalling the Ten Commandments or signing an honor code” eliminates cheating completely, while offering “poker chips” to redeem for cash, a few seconds later, doubles the level of cheating (Ariely 2008, p. 24; Aquino et al. 2009).

The Holy Bible, the Ten Commandments, and ethical and moral values significantly enhance individuals’ honesty, integrity, and happiness (Gu et al. 2015; Tang 2007, 2012, 2016; Tang et al. 2018a, b). Further, supervisors, with a high level of supervisory guidance and behavioral integrity (Simons 2002a, b), curb and diminish deviant behavior (Dineen et al. 2006). The supervisor’s behavioral integrity moderates the relationship between supervisory guidance and deviant behavior (Robinson and Bennett 2000).

There are several important implications. First, ethical values and cultures at the individual and organization levels significantly impact people’s moral intentions and behaviors (Gerhart 2009; Kish-Gephart et al. 2010; Tang et al. 2018a, b). On the one hand, the Ten Commandments signify sacred and spiritual values. On the other hand, poker chips mean secular or immoral values (gambling). Individuals’ evaluation of the immediate context, e.g., moral values and temptations, triggers them to behave ethically or unethically. Thus, perceptions of ASPIRE, or the lack thereof, may profoundly impact people’s ethical/unethical behavior intention, respectively.

The theory of planned behavior posits that our attitudes predict our behavioral intentions, which, in turn mold actions (Ajzen 1991). Our deep-rooted guiding principles and values shape our beliefs. Following research on values in the literature (e.g., Grouzet et al. 2005; Schwartz 1992), there are two primary dimensions: (1) intrinsic-extrinsic goals and (2) self-transcendent-self-enhancing goals. Intrinsic values focus on the community and the environment, whereas extrinsic values pay attention to financial success and money (Tang 1992, 2012). Self-transcendent values center around *sacred* values and ethical, moral, and proper actions and behaviors, whereas self-enhancement values stress *secular* values, hedonism, achievement, success, power, and materialistic concerns. The *sacred* and self-

transcendent principles are the exact opposite of worldly, *secular*, and self-enhancement values.

Comparing the *secular* or materialistic view with the sacred (spiritual) or transcendent perspectives (Harper 2008), religion shapes perceptions of right and wrong, affecting behaviors of individuals and organizations (Longenecker et al. 2004; Parboteeah et al. 2009; Van Buren et al. 2019). The law of God (Torah) provides a rich source of moral and practical guidance for contemporary business ethics (Van Buren and Greenwood 2013).

Second, following the Holy Bible, “We aspire to please him” (2 Corinthians 5: 9). Therefore, do we all ASPIRE to please Jesus? In our modern work environment, leaders and supervisors have power and authority. In the literature, leaders have not only organizational power – legitimate power, reward power, and coercive power but also personal power – expertise power and referent power (French and Raven 1959; Yukl 2004). Due to the five bases of power, do most employees ASPIRE to please their supervisors (Tang and Liu 2012)? Furthermore, when people combine these constructs, do they all want to be the light of the world (Matthew 4: 16; John 8: 12, 9: 5) and salt on earth (Matthew 5: 13) and serve as a role model for others? Monetary Wisdom offers practical implications: Serving God leads to growth and prosperity. Serving mammon leads to death and poverty.

Jesus said to his disciples, “Whoever wishes to come after me must deny himself, take up his cross, and follow me. For whoever wishes to save his life will lose it, but whoever loses his life for my sake will find it” (Matthew 16: 24–25). In the book of John, “Then [Jesus] poured water into a basin and began to wash the disciples’ feet and dry them with the towel around his waist” (John 13: 5). Jesus told Simon Peter, “Unless I wash you, you will have no inheritance with me” (John 13: 8). “If I, therefore, the master and teacher, have washed your feet, you ought to wash one another’s feet. I have given you a model to follow, so that as I have done for you, you should also do. If you understand his, blessed are you if you do it” (John 13: 15–17). “But many that are first will be last, and [the] last will be first” (Mark

10: 31). Leaders must serve employees and empower them to serve each other as leaders. How do we store treasures in heaven (Matthew 6: 19–21)? Nowadays, people store treasure in other individuals' hearts, as they remember the feelings about us.

Robert K. Greenleaf coined the term "servant leadership" in an essay that he first published in 1970: *The Servant as Leader*. In that essay, Greenleaf articulated: "The servant-leader is servant first. . . It begins with the natural feeling that one wants to serve, to serve first. Then conscious choice brings one to aspire to lead".

Tang and Liu (2012) treated the perceptions of authentic supervisors' behavioral integrity and character (ASPIRE) as a moderator of the relationship between (1) people's avaricious monetary aspiration, the love of money, LOM (Tang and Chiu 2003), and (2) their propensity to engage in unethical behavior (PUB, Chen and Tang 2006). Greedy and avaricious individuals have many foolish and harmful desires, are likely to take action and make money (Tang et al. 2000), fall into temptation (Ariely 2008), and have high unethical behavior intentions (Tang and Chiu 2003).

Greedy individuals have high Machiavellianism (Christie and Geis 1970) and employ aggressive and devious methods to achieve goals without regard for the feelings, rights, and needs of other people, leading to a high level of unethical behavior intention (Tang and Chen 2008). Authentic supervisors with a high level of personal integrity and character (ASPIRE) may serve as role models for employees, create an ethical culture in the organizational environment, encourage people to behave ethically, and curb unethical behavior intention than those without ASPIRE.

In the presence of high ASPIRE, greedy people obey authority figures (Milgram 1974), heed the supervisors' moral values, avoid falling into temptations (Ariely 2008), and do what is ethically right and rewarded (Skinner 1972). They will prohibit their manipulative, exploitative, and devious intention to come out, leading to a low

level of unethical behavior intention. When the cat's away, the mice will play.

"Authentic Supervisors' Personal Integrity and Character" (ASPIRE) has three inter-related sub-constructs: Supervisors who (1) show honesty, fairness, and integrity (Honesty and Integrity), (2) care about others' work and provide services to subordinates as servants (Caring Servant), and (3) are friendly and offer transparent decision-making and professional development (Transparent Help).

## Research Findings

In this five-wave panel study, 266 part-time employees (business students) completed the five survey questionnaires, enhancing the psychological separation of predictors and criterion. Students completed unethical behavior intention (propensity to engage in unethical behavior, PUB) and ASPIRE about 8–10 weeks apart and avaricious monetary aspiration between the two measures, 4 weeks apart (Podsakoff et al. 2003). Participants were 155 (58.27%) male and 111 (41.73%) female. Researchers collected data in 2 years with a 95% return rate. Using a multiple-panel research design, Tang and Liu (2012) explore the interaction effect between individuals' avaricious monetary aspirations and perceptions of supervisors' authentic personal integrity and character (ASPIRE) on self-reported unethical behavioral intentions.

Correlational data reveal the following results. ASPIRE is positively related to avaricious monetary aspiration but negatively associated with unethical behavior intention (PUB). Unethical behavior intention (PUB) is significantly correlated with their high Machiavellianism, low self-esteem, and low intrinsic religiosity.

In multiple regression analysis, researchers controlled for participants' age, sex, education, and work and their self-esteem, religiosity, and Machiavellianism, in two steps. Counterintuitively, the main effect of aspiration on unethical intention is not significant. The main effect of

ASPIRE on unethical intentions is significant. Further, the interaction effect between aspiration and ASPIRE on unethical intention is significant.

High avaricious monetary aspiration, or the love of money, is related to high unethical behavioral intentions for people with low perceptions of their supervisors' ASPIRE values. However, high aspiration is related to low unethical intention for those with high perceptions of their supervisors' ASPIRE values. More specifically, people with high aspirations and low ASPIRE perceptions have the highest unethical behavior intention, whereas those with high aspirations and high ASPIRE perceptions have the lowest. This study offers exciting implications related to individual differences, ethical environment, and perceived demand characteristics (PDC). Future researchers must empirically explore Monetary Wisdom in a different context with other constructs, offer further theoretical, empirical, and practical implications, and enhance future theory development and testing (Colquitt and Zapata-Phelan 2007).

Future Research

Please see Fig. 1 of Tang (2020a) for all the subconstructs and items. Researchers may combine these two chapters and explore Monetary Wisdom. Readers may also apply the ASPIRE construct using a reflective SEM model in Fig. 1 and the formative SEM model in Fig. 2. Research shows that the formative model is better than the reflective model. The subconstructs and items of ASPIRE are presented below for future scholars.

ASPIRE—Factors and Items

Factor 1 Honesty and Integrity

- 1. My direct supervisor is honest
- 2. My direct supervisor is fair
- 3. My direct supervisor keeps his/her promises

Monetary Wisdom: The Love of Money, ASPIRE, and Unethical Behavioral Intention, Fig. 1 A Reflective Theoretical Model

**Monetary Wisdom: The Love of Money, ASPIRE, and Unethical Behavioral Intention, Fig. 2** A Formative Theoretical Model

**Factor 2 Caring Servant**

- 4. My direct supervisor cares about my work
- 5. My direct supervisor provides service to me and my colleagues
- 6. My direct supervisor helps me with my work

**Factor 3 Transparent Help**

- 7. My direct supervisor is friendly
- 8. My direct supervisor helps me with my professional development
- 9. My direct supervisor is transparent in making decisions

**Conclusion**

In this five-panel study, after controlling for participants’ age, sex, education, work experience, self-esteem, religiosity, and Machiavellianism, the interaction effect between (1) individuals’ avaricious monetary aspiration and (2) their perceptions of their authentic supervisors’ personal

integrity and character on their self-reported unethical behavioral intentions reveals profound findings. Counterintuitively, the main effect of avaricious monetary aspiration on unethical intention is not significant. The main effect of ASPIRE and the interaction effect between ASPIRE and monetary aspiration, the love of money, on dishonesty are significant. More specifically, people with high aspirations and low ASPIRE perceptions have the highest unethical behavioral intention. Those with high aspirations and high ASPIRE perceptions have the lowest. Employees’ perceptions of their authentic supervisors’ personal integrity and character (ASPIRE) matter in their self-reported unethical behavioral intentions.

Monetary Wisdom suggests that decision-makers select their deep-rooted personal values as part of their executive cognitive functions and frame the critical concerns in the proximal (immediate) and distal (omnibus) contexts to maximize their expected utility and ultimate serenity. Avaricious-greedy individuals are

sensitive to the context and act proactively. Leaders' avaricious monetary aspiration and personal integrity and character may create a trickle-down effect in organizations. Future researchers must empirically test and expand Monetary Wisdom using additional constructs across cultures and offer further theory development and testing.

## Monetary Wisdom: The Matthew Effect in Monetary Wisdom: Intelligence Versus Wisdom

Thomas Li-Ping Tang

Department of Management, Jennings A. Jones College of Business, Middle Tennessee State University, Murfreesboro, TN, USA

## Synonyms

Aspiration for money; Attitude toward money; Behavior; Behavioral intentions; Business ethics; Greed; Items; Love of money; Meaning of money; Measurement scales; Monetary wisdom; Outcome variables/constructs; Prospect theory; Risk averse; Risk seeking; The dark and bright sides; The have-nots; The haves; The Holy Bible; The Matthew effect; The Parable of the Talent; Theoretical model; The Enron Effect

## Introduction

The Matthew effect is a double-edged sword with both the bright and dark sides. The Matthew effect also creates “the haves” and “the have-nots.” As a consequence, the rich get richer; the poor get poorer. On the dark side of the Matthew effect, some CEOs were extremely smart. However, they apply their intelligence to engage in corruption and unethical behaviors. Corruptions destroyed corporations, executives, and employees’ careers. The poor (with intelligence but without wisdom) get poorer. On the bright side, other CEOs promote ethical climate, make employees happy, and reap their return on investment (ROI), achieving expected utilities, and ultimate fulfillment. Furthermore, individuals with monetary wisdom curb their desire for money, become good stewards, and enjoy their ultimate happiness and satisfaction in their lives. Thus, the rich (with intelligence and wisdom) get richer. The Matthew effect applies to individual, group, and organizational, and country and society levels.

## The Matthew Effect

Monetary Wisdom (Intelligence) asserts: Individuals apply their deep-rooted personal values (the aspiration for money or the love of money) to frame critical concerns in the proximal (immediate) and distal (omnibus) contexts to maximize expected utilities and ultimate happiness. Following Robert K. Merton's (1968) notion of the Matthew effect published in *Science*: "For to everyone who has, more will be given and he will grow rich; but from the one who has not, even what he has will be taken away" (Matthew 25: 29). Therefore, the Matthew effect has bright and dark sides. The Matthew effect also creates "the haves" and "the have-nots." As a consequence, the rich get richer; the poor get poorer. In this entry, I will discuss both bright and dark sides of the Matthew effect in monetary wisdom: wisdom versus intelligence. "The Parable of the Talents" in the Holy Bible presents the exciting story helping readers fully understand the Matthew Effect.

It will be as when a man who was going on a journey called in his servants and entrusted his possessions to them. To one he gave five talents; to another, two; to a third, one—to each according to his ability. Then he went away. Immediately the one who received five talents went and traded with them, and made another five. Likewise, the one who received two made another two. But the man who received one went off and dug a hole in the ground and buried his master's money. After a long time, the master of those servants came back and settled accounts with them. The one who had received five talents came forward bringing the additional five. He said, 'Master, you gave me five talents. See, I have made five more.' His master said to him, 'Well done, my good and faithful servant. Since you were faithful in small matters, I will give you great responsibilities. Come, share your master's joy.' [Then] the one who had received two talents also came forward and said, 'Master, you gave me two talents. See, I have made two more.' His master said to him, 'well done, my good and faithful servant. Since you were faithful in small matters, I will give you great responsibilities. Come, share your master's joy.' Then the one who had received the one talent came forward and said, 'Master, I knew you were a demanding person, harvesting where you did not plant and gathering where you did not scatter; so out of fear I went off and buried your talent in the ground. Here it is back.' His master said to him in reply, 'You wicked, lazy servant! So you knew that

I harvest where I did not plant and gather where I did not scatter? Should you not then have put my money in the bank so that I could have got it back with interest on my return? Now then! Take the talent from him and give it to the one with ten. For to everyone who has, more will be given and he will grow rich; but from the one who has not, even what he has will be taken away. And throw this useless servant into the darkness outside, where there will be weeping and grinding of teeth'. (Matthew 25: 14–30)

Nobel Laureate, Kahneman (2011), developed the prospect theory. Following prospect theory, one may frame decisions under uncertainty in "gains-losses domain" and "high-low probability." Further, the formation of the problem, the norms, and the decision-maker's personal characteristics influence one's decision frame. Kahneman (2011) declared that the fourfold pattern of risk attitudes is one of the core achievements of prospect theory. It reveals risk aversion for gains and risk seeking for losses in the context of high probability (the certainty effect) and also risk seeking for gains and risk aversion for losses in the context of low probability (the possibility effect). Prospect theory provides a value function, the S-shaped curve, that is concave for gains, convex for losses, and steeper for losses than for gains. Interestingly, no research has incorporated "cultural differences in attitude toward money" (Kahneman 2011, p. 298) in testing nor extending Kahneman's prospect theory (Tversky and Kahneman 1974) from a choice of options at the individual level to managers' ultimate choice of corruption on the dark side (intelligence) and happiness on the bright side (wisdom) across cultures.

## The Dark Side

A study of 6382 managers in 31 countries (entities) across six continents presented the following theory: Managers apply their love of money to frame corruption in the contexts of two levels of subjective social norm: (1) perceived corporate ethical values (CEV) at the micro-level (Level 1) and (2) Transparency International's Corruption Perceptions Index (CPI) at the macro-level (Level 2) (Tang et al. 2018). Our

cross-level analysis of data from multiple sources (at the individual and country levels) reveals a significant three-way interaction effect.

Researchers have classified individuals of the study into four groups and, then, into three barrels: the good barrels (high CEV/high CPI), mixed barrels (low CEV/high CPI or high CEV/low CPI), and bad barrels (low CEV/low CPI), displaying low, medium, and high magnitude (quantity) of dishonesty, respectively. With high CEV (perceptions of ethical values at the organizational level), the intensity of the relationship between the love of money and corruption is the same across cultures. With low CEV, the intensity of corruption is the highest in high CPI entities (risk seeking of high probability) – the certainty effect (the Enron Effect); but the lowest in low CPI entities, showing risk aversion of low probability – the possibility effect. CPI (ethical value at the entity level) has a strong impact on the magnitude of corruption, whereas CEV (ethical value at the organizational level) has a strong impact on the intensity of corruption. Results demonstrate dishonesty in light of monetary values and two frames of social norm, revealing critical implications to the field of behavioral economics and business ethics.

These profound discoveries offer exciting cross-cultural differences on corruption. With low CEV (low ethical culture at the organizational level), the intensity of the relationship between the love of money and corruption is the highest in high CPI entities (high ethical culture at the country level). Corruption reflects managers' risk-seeking behaviors in the context of high probability – the certainty effect. That is, in a country like the USA, robust economic, legal, political, and social infrastructures exist. Therefore, due to the free press, open communication, and a solid legal system, the probability of getting caught for corruption is pretty high.

Following the Parable of the Talents in the Holy Bible and the perspectives of the master and principal, "And throw this useless servant into the darkness outside, where there will be wailing and grinding of teeth" (Matthew 25: 30). Did this happen in the real world of work in the USA? Our readers may recall the sad story that

corruption caused the destruction of the Enron Corporation, Arthur Andersen, and the careers of more than 110,000 employees worldwide.

It is safe to assume that the CEO, Jeffrey Skilling, and other executives were brilliant and smart individuals. They all have earned their MBAs from top business schools and moved their way up to the top of the organizational echelon. Jeffrey Skilling earned his MBA from the Harvard Business School. Intelligence without wisdom has caused avaricious executives to become corrupt. Consequently, corruption destroyed their careers, freedom, integrity, and reputation. Many top executives were incarcerated. Jeffrey Skilling served 12 years in the Alabama minimum-security federal prison for his 24-year sentence. Enron CEOs and senior executives applied their "intelligence" to maximize expected utilities, but lost their ultimate happiness in the long run. The costs outweigh the benefits. It is the Enron Effect. This is the dark side of the Matthew Effect in Monetary Intelligence. The poor get poorer. Here, researchers have used the term Monetary Intelligence, not Monetary Wisdom, on purpose (Tang and Chen 2008).

## The Bright Side

One longitudinal study bridges the gap between stock volatility and behavioral economics (N. Tang et al. 2018). Researchers recruited individual private investors ( $N = 229$ ) in Shanghai – the financial capital of China and collected longitudinal data from multiple sources and at multiple times. They asked participants (investors) to answer a survey, involving their love of money (Rich-affect, Motivator-behavior, and Good and Important-cognition) and demographic variables. During the 2008 financial crisis, scholars obtained public records – daily Shanghai Stock Exchange Composite Index ("the Index") for 30 consecutive trading days. To collect investors' private information – daily Index Happiness, Stock Percentage (stocks/liquid assets), and Stock Happiness, a team of researchers text-messaged all investors and solicited their daily responses.

Investors' data illustrate several profound discoveries: Interestingly, investors with high Rich motive fret about low Index happiness, yet investors with high Rich motive and high Importance cognition boast high stock happiness, supporting the endowment effect and investor hubristic smirk. Investors who consider money as a Motivator quickly adjust their stock percentage and change their portfolio, but suffering low Index happiness and low stock happiness. Gender moderates the relationship between the Index and Index happiness. Our panel data of intrapersonal changes of stock happiness illustrate investor monetary wisdom in the boom-and-bust cycles. That is, to be happy, investors must become masters of money, but not slaves to money, and behaviorally deactivate money as a Motivator.

Restraining investors' desire to become Rich enhances happiness after gains, in the boom cycle (risk aversion). Realizing money's Importance bestows happiness after losses, in the bust cycle (risk seeking). We cannot take the money attitude's cognitive component for granted: Money is Good and Important. Monetary wisdom in this study expands prospect theory and offers exciting implications to not only investors' wealth, health, and happiness during the financial crisis but also individuals' subjective well-being (SWB) and happiness in general. In a sense, following the Parable of the Talents, the master said to the servant, "Well done, my good and faithful servant. Since you were faithful in small matters, I will give you great responsibilities. Come, share your master's joy." The rich get richer. This is the bright side of the Matthew Effect in Monetary Wisdom.

Nobel Laureate, Daniel Kahneman (2011), counseled us: "Closely following daily fluctuations is a losing proposition, because the pain of the frequent small losses exceeds the pleasure of the equally frequent small gains" (p. 339). Therefore, investors must focus on long-term valuation. This strategy helps investors deliberately evade the stock volatility and improve their emotional quality of life.

Following the Parable of the Talents, "Then he (the master) went away." "After a long time the master of those servants came back and settled accounts with them" (Matthew 25: 15, 19). I want

to argue that investors may heed the advice clearly stated in the Holy Bible and do the same.

Following 2016 Nobel Laureate, Richard H. Thaler, and the Matthew Effect's bright and dark sides, I offer readers some good ideas to nudge toward making better decision and become healthier, wealthier, and happier (Thaler 2015, 2018; Thaler and Sunstein 2008).

## Moral Entrepreneurship

Muel Kaptein

Business Ethics and Integrity Management,  
Rotterdam School of Management, Erasmus  
University, Rotterdam, The Netherlands

### Synonyms

Ethics pioneer; Innovative ethical leadership;  
Leader in ethics; Leadership in ethics; Moral  
frontrunner; Moral leadership; Moral reformer;  
Proactive ethical leadership

### Introduction

The moral entrepreneur is a person or organization who creates a new ethical norm that others follow. Moral entrepreneurship is the process by which such ethical norm is created.

Moral entrepreneurs are leaders in ethics. They develop new and better ethical norms. Apart from challenging an ethical norm, rethinking ethics, and reflecting on ethical goals, moral entrepreneurs also create new ethical norms. Moral entrepreneurs are innovators and pioneers in ethics. They disrupt existing moral codes and give rise to a new one. They alter the views about what is “right” or “wrong.” Instead of simply following current or accepted morality, moral entrepreneurs lead morality through the creation of a new morality.

The moral entrepreneur should not be confused with the social entrepreneur. Whereas social entrepreneurs can be agents of change and emphasize innovation, they do not necessarily introduce new ethical norms. However, social entrepreneurs can also develop new products and services that make existing ethical standards more feasible. Likewise, a moral entrepreneur, as an innovator in ethics should not be confused with the ethical innovator who innovates in a normatively appropriate way. Neither is moral entrepreneurship the morality of entrepreneurship, which is the values and norms associated with being an entrepreneur.

The concept of moral entrepreneurship does not suggest that a person or organization is a leader in ethics regarding every relevant norm. Moral entrepreneurship is norm-specific. The moral entrepreneur can display moral entrepreneurship regarding one issue while being reactive or passive regarding another.

### Origin

The concept of moral entrepreneurship has its origin in the sociological literature. Becker coined the term in 1963 to explain how moral reforms happen. Becker’s central thesis was that social groups create deviance by making rules and applying these rules to people who deviate and then labeling the deviants as outsiders. For Becker, moral entrepreneurs are people who make this moral reform happen. He differentiates between two kinds of moral entrepreneurs: those who create new norms and those who enforce these new norms. The crusading reformer, as rule-creator, is the moral entrepreneur par excellence. The moral entrepreneur experiences some evil that profoundly disturbs him and that he wants to correct by translating a preferred norm into legal prohibitions; however, he also risks becoming an outsider himself when he is not successful in his attempt to create support for the new rule or norm, as Becker argued.

---

This chapter is largely based on my article “The moral entrepreneur: a new component of ethical leadership”, published in the *Journal of Business Ethics* in 2019.

## Examples

Outside the business and professional literature, the concept of moral entrepreneurship has been applied to the challenges faced by non-governmental organizations concerned with human rights, to the conditions under which global norms become part of the agenda of global governance, to the transformation and institutionalization of international commercial arbitration as the leading contractual method for the resolution of transnational commercial disputes, and to cooking shows on television that tackle some social problems like health and social exclusion. Other examples of moral entrepreneurship analyzed in the literature are the development of moral norms against smoking, drunk driving, underage drinking, and copyright infringement. A scale has also been developed to assess the personality of moral entrepreneurs.

In the business and professional literature, the concept of moral entrepreneurship has been employed in analyzing the careers of exemplars of the moral entrepreneur, to the actions of multinational enterprises fighting corruption in largely corrupt regimes, and in explaining why employees who observe wrongdoing speak up to correct the wrongdoing or wrongdoers. Other examples provided in the literature are:

- A CEO who, based on the belief that once goods are delivered the money for it belongs to the supplier, decided to pay invoices immediately even though the norm in the sector then was to only pay suppliers after 90 days.
- A manager who, out of respect for animals, led his airline company to be the first to introduce a ban on the transport of dead animals as hunting trophies.
- A lingerie shop manager who, out of respect for women, made his shop the first in his country to stop portraying scantily dressed women on advertising billboards.
- An organization that, out of respect for the stakeholders, established the new norm requiring employees to prevent not only conflicts of interest but also the appearance of it.

## Importance of Moral Entrepreneurship

Demonstrating moral entrepreneurship is important. Some reasons for this are:

- Moral entrepreneurship has a positive influence on society: the creation of a new ethical norm that will be followed can contribute to a better society.
- Moral entrepreneurship improves trust: Moral entrepreneurship indicates that the moral entrepreneur values ethics by going further than what is expected, has a good will, and the drive to improve society.
- Moral entrepreneurship creates efficiency: by being proactive the moral entrepreneur demonstrates self-regulation that may prevent interventions and measures, like rules and regulations, set by others.
- Moral entrepreneurship is good for self-actualization: making a moral difference can advance individual (or organizational) self-fulfillment and self-development.

## Dimensions

Moral entrepreneurship can be described in terms of its various dimensions. Some of the relevant ones are:

- The actor: Who is the moral entrepreneur? Is it an individual or an organization? If an individual, then the hierarchical level of this individual can be employee, manager, or CEO. If an organization, then is it a business or a sector organization, or is it a team or division within an organization? Is the moral entrepreneur one or more individuals or organizations?
- The object. What type of ethical norm is created? To which value, principle, or stake is the norm related? What issue does it aim to solve, and how big is the difference with the current ethical norm?
- The process. What is the process of creating the new ethical norm that others follow? Is it gradually or suddenly, formally or informally, individually or collectively, iteratively or

- straightforwardly, consciously or unconsciously? What type of arguments does the moral entrepreneur use to convince followers?
- The subjects. Who are the followers? Are they inside or outside the organization, sector, or country? How many followers are there? What are the other characteristics of the followers and nonfollowers?
  - The context. What is the context and situation in which the moral entrepreneurship takes place? Is it a crisis or a stable situation? One of scarcity or abundance? Is it well-ordered or complex, with many or few pressures and issues?
  - The output. To what extent is the new ethical norm observed? Is it followed sometimes or always? Is the new ethical norm deeply or only superficially embedded? Does the government adopt it in its laws and regulations and is there supervision and enforcement? Are there further innovations by others on the new ethical norm?

## Relationship with Other Concepts

The concept of moral entrepreneurship is closely related to other concepts. Three of those concepts discussed here are ethical leadership, corporate social responsibility, and proactive leadership.

Moral entrepreneurship is one of the three layers of ethical leadership. There is one widely used definition of ethical leadership developed by Brown et al. (2005). They define ethical leadership as “the demonstration of normatively appropriate conduct through personal actions and interpersonal relationships, and the promotion of such conduct to followers through two-way communication, reinforcement, and decision-making” (p. 120). According to Brown et al., managers become ethical leaders, firstly, by being and behaving ethically, that is, by fulfilling the role of “moral person”; and secondly, by promoting the ethical behavior of others through two-way communication, reinforcement, and decision-making, that is, by fulfilling the role of “moral manager.” This definition suggest that ethical leadership is consistent with what a particular

society or culture defines as right and wrong or as good and evil. According to this definition, the ethical leader follows current morality. However, the ethical leader can also lead morality. So, an ethical leader can also be a moral entrepreneur who creates new ethical norms. Thus ethical leadership is “the demonstration of normatively appropriate *and new* conduct...” The moral entrepreneurship component complements the two other components of ethical leadership: whereas the moral person is oriented towards *who* the leader is and the moral manager towards *how* the leader influences others, the moral entrepreneur is focused on *what* norms to establish.

Moral entrepreneurship relates to the highest level of corporate social responsibility. Studies on corporate social responsibility are concerned with how companies can contribute to societal development not only in the sense of solving social problems but also in the sense of improving social welfare, promoting social progress, and creating new social value. According to Carroll's (1979) widely used typology, there are four kinds of strategies that companies can follow to contribute to the development of society: obstructionist, defensive, accommodative, and proactive. These strategies are in a continuum, from doing nothing to doing much. The difference between an accommodative and proactive strategy is that companies that adopt an accommodative strategy meet stakeholders' demands without initiating voluntary actions for the common good, whereas companies with a proactive strategy initiate voluntary actions for the common good, and they lead the sector or industry. Thus, being proactive coincides with the highest level of social responsibility. It is only at this level, according to Carroll, that leadership takes place. It is also at this level that moral entrepreneurship takes place.

Moral entrepreneurship is an example of proactive leadership. Based on a literature review, Wu and Wang define proactive leadership as “generating and enacting self-initiated and future-focused leading actions that are persistently sustained to bring changes toward the environment” (2011, p. 305). In their view, proactive leadership requires leaders to do more than what is required and expected of them. This kind of

leadership is also forward-looking, responsive to opportunities or challenges in advance rather than merely focused on the problems or demands at hand. Such leaders actively set goals to create a better future. Proactive leaders actively master and effect changes in their environment. Proactive leaders are innovative. The quality of proactiveness also distinguishes leadership from management. A crucial difference is that management concerns the implementation of what is set and what others expect, whereas leadership concerns, first and foremost, the setting of new standards and the formulation of new ambitions and goals. Moral entrepreneurs are in this sense proactive leaders who set new standards to create a better future.

## Antecedents

Moral entrepreneurship has many antecedents. They can be grouped into the opportunity for moral entrepreneurship, the vision on moral entrepreneurship, and the capability for moral entrepreneurship.

### Opportunity for Moral Entrepreneurship

*A1. Moral Issues.* Moral entrepreneurship depends on whether there are moral issues that need to be addressed or that will arise in the short or long term. These moral issues, whether they are problems, dilemmas, or challenges, are conditions for or enablers of societal improvement and development. It is not only the number of moral issues that creates room for moral entrepreneurship but also their urgency. The urgency of an issue is its magnitude in terms of potential harm and its proximity in time and space. The more urgent an issue, the more morality or an appropriate normative response is required. Moral entrepreneurs are critical for norm emergence because they call attention to moral issues or even create them.

*A2. Moral Void.* Moral entrepreneurship is required only if morality is lacking or inadequate with respect to a particular issue; in other words, if there is a moral void. Moral void is the absence of a shared and adequate moral orientation. The moral entrepreneur can only introduce a new ethical norm when that norm does not exist yet. This

means that moral entrepreneurship is not a moral obligation for everyone in an organization or profession. When there is no opportunity for moral entrepreneurship, we cannot blame people and organizations for not showing it.

### Vision on Moral Entrepreneurship

*B1. Moral Awareness.* Moral awareness – the recognition of the moral aspects of a given situation – is essential for moral entrepreneurship. It is not enough that moral entrepreneurs recognize the moral dimensions of a given issue; they should also recognize that an issue is (potentially) arising. The process of anticipating moral issues is clearly critical to the success of moral entrepreneurs: they have an image of the future of a society, including what will happen and what might happen. Moral entrepreneurs may show their leadership in situations where others have not yet recognized an issue, or where the issue is still at a very early stage of development, or where the issue has not yet manifested itself. Moral entrepreneurs have the moral awareness or sensitivity to recognize moral issues as such.

*B2. Moral Development.* How to come up with a new ethical norm after recognizing a moral issue is crucial for moral entrepreneurship. Moral entrepreneurs have an image not only of what will happen and what might happen but also of what ought to happen. Following Kohlberg's three levels of moral development, moral entrepreneurship is negatively related to the second level (where people follow the moral conventions in their environment) and positively related to the third level (where people base their arguments on principles that they believe are right and good for society).

*B3. Moral Identity.* Where there is an abundance of moral issues for which there is no or inadequate morality, moral entrepreneurship does not require that a person or organization shows leadership on all those issues. The moral issue(s) to which an individual or organization decides to commit is likely to depend on their moral identity, understood as their self-conception around a set of moral traits. Some specific traits of a person's or organization's identity may be related to the specific issues with regard to which they will choose to demonstrate moral

entrepreneurship. For example, one whose moral identity is linked to caring for the natural environment is more likely to select issue(s) and norms in that area than someone who identifies with being a good employer or fair competitor.

### Capability for Moral Entrepreneurship

*C1. Drive Towards Transition.* Moral entrepreneurship coincides with transitional leadership in the sense that these persons or organizations are not focused on improving current practices to catch up with current ethical norms. Instead, they are focused on improving current ethical norms through the introduction of new and better ones. An antecedent of moral entrepreneurship is thus the extent to which a person or organization is driven toward transition, i.e., toward focusing on improving one or more ethical norms. This drive is important because improving ethics is a struggle accompanied by conflict and resistance. Therefore, moral entrepreneurs are committed and dedicated. They persevere because they have a deeply rooted drive to change.

*C2. Capability to Gain Power.* Moral entrepreneurship is successful when others adopt the new ethical norm. This points to the importance of moral entrepreneurs gathering support for their proposed new norm. Therefore, it is crucial for moral entrepreneurs to gain power. There are many sources and tactics of power. Power can be developed through relationships, reputation, credibility, networks, competence, information, skills, and expertise. Moral entrepreneurs can encourage the inclusion of issues on the agenda in various ways, for instance, through their use of the media, lobbying, and testimony. Through role modeling, that is, demonstrating the new norm through one's own behavior, moral entrepreneurs can also gain power. What is relevant for moral entrepreneurs is the extent to which they are capable of building their power and applying that power in a manner that gets others to adopt the new ethical norm.

### Finally

Moral entrepreneurship is a useful concept to describe not only the development of ethics of businesses and professions but also of people

and organizations that become leaders because they create new ethical norms and are able to get followers for these norms.

### Introduction

Moral self-awareness theory stems from a growing consensus that burgeoning inequality,

ideological division, and the detrimental effects of climate change together suggest that if capitalism is to be globally sustainable, it will need to be based on a more integrated and aspirational conception of self-interest – one that can activate – and not simply dissipate moral virtue. For ultimately, moral and social responsibility require more than thinking in terms of mere financial or reciprocal self-interest. Otherwise, economic actors run the risk of rationalizing negative individual actions that only become problematic in the aggregate. This conflict of incentives between social and financial purpose presents business leaders and policy makers with the challenge of how to motivate economic actors to engage in more virtuous behavior. Moral Self-Awareness theory offers a way forward for how virtue may be built back into capitalism by leveraging the powerful psychological forces of pride, shame, and guilt.

The approach builds on historical, psychological, and philosophical research demonstrating that financial incentives have never in fact been the only motives behind free markets, but that markets themselves are representations of our individual and collective moral identities.

Organizational scholars have observed that the influential *homo-economic* conception of human nature as intrinsically self-interested has led to a default reliance on economic incentives, leading to a gradual dissipation or *crowding-out* of civic and prosocial dispositions across society over the late twentieth and early twenty-first centuries. Moral self-awareness provides a corrective to this tendency via a four-stage motivational construct anchored in systems theory, leading consumers, workers, and business leaders to progressively higher levels of virtue for increasing human flourishing and positive externalities.

## The Moral Dimensions of Markets

While free markets are traditionally characterized as amoral transactions between self-interested actors, organizational scholars over the last 30 years have demonstrated that those interactions are in fact also determined and conditioned by myriad moral considerations. It is often forgotten

that the essential underpinnings of market transactions – specifically, (1) what can be owned and traded, (2) who can own and trade, and (3) the conditions under which trade may occur – already embody a moral assessment of who we are and who we aspire to be, both individually and collectively. Indeed, the continuing moral progress of markets is realized by such self-reflective considerations.

### What Can Be Owned and Traded

From ancient to modern times, children and adult persons were openly owned and exchanged through networks of international trade. On strict utilitarian grounds, this might arguably not have been unjust so long as it could be shown that such trade dramatically increased economic output, thereby maximizing total happiness for all concerned. Slave owners became intensely efficient at exploiting their property and many of their practices developed to extract the greatest value from those assets – from production quotas to asset depreciation – are still in use today.

Had profit maximization been the only determining factor as to whether slave markets would continue, these markets might still be widely in existence. The fact that they are not – and indeed quite repellant to our common sensibilities – owes to our increasing levels of moral self-reflection as a society. Gradually, it became abhorrent to own and trade human persons simply because it became increasingly recognized as an immoral business practice by the same individual stakeholders who once embraced it. This is a clear example of how evolving moral self-awareness functions to effect collective social progress in business practice. Looking forward, nonhuman animals have started to garner their own legal rights against torture and abuse, and moral vegetarianism and veganism are globally on the rise – fueled very much by increased moral self-reflection.

### Who Can Own and Trade

The second structural dimension of markets informed by moral self-reflection is who can own and trade. Children, for example, might benefit financially from trading their labor, and strict free market principles would maintain that they

should be allowed to do so. However, those with longer-term perspectives on children's interests will point out that they – and society – would be better served by their staying in school. For these reasons, most states, with glaring exceptions including in Sub-Saharan Africa, have deemed child labor abhorrent and illegal, though the reverse was often true in the past. These restrictions did not just apply to labor, as women were widely banned from owning property in the UK and USA until the late 1800s. By extension, women were not generally granted the right to vote in public elections until well into the next century.

Beliefs regarding who should or should not own property, or be able to trade in markets, or participate in electoral decisions, are evolving morally self-reflecting assessments of who we are as individuals and who we collectively aspire to be. They are not mere financial considerations and to even construe them as such is now properly considered vile.

### **The Conditions Under Which Trade May Occur**

The third structural dimension of markets that is informed by moral self-reflection is the condition under which trade may occur. Strict free market proponents would argue that the conditions of any sale are entirely subject to the transactors concerned. However, there are three classical problems with this argument: (1) what is enforceable in court evolves, as noted above regarding what and who may trade, (2) information asymmetry between buyers and sellers places greater risk on the former, who does not know the true quality of the product or service being traded, which is why consumer protection laws exist, and (3) not all dimensions of the transaction are necessarily priced into the trade, as negative externalities such as pollution may exist.

In sum, what can be owned and traded, who can own and trade, and the conditions that allow for trade, all define what we value as a society. Indeed, the mere existence of a market may communicate social information about the appropriateness of trading itself, potentially rendering what is morally questionable to be considered more allowable. As such, markets themselves

may tend to corrode moral virtues. They therefore continually require the moderating influence of moral self-reflection by the economic actors that create, innovate, and perpetuate them.

## **The Structure of Moral Self-Awareness**

Social psychology has established a relationship between moral identity and moral thought and action, and the wider literature on civic mindedness indicates that pride and shame are the most effective moral motivators of civic behavior. Furthermore, ethical consumers are happier and have stronger repurchase intentions when motivated by their moral self-image. This indicates that economic actors are more likely to engage in responsible behavior when focusing on how their actions reflect upon themselves than when focusing solely on the potential harm they may be alleviating.

Moral self-awareness (MSA) is a four-stage evolving mindset informed by reflection on moral identity, namely, what one's actions say about oneself given (a) the negative impact on others or society that one's action may produce, and (b) what one contributes to others and/or society by taking a given action. While operative at the lower levels, the painful emotional triggers of shame and guilt become progressively less important at each successive stage of self-awareness, ultimately becoming unnecessary at the highest level.

### **MSA Level 1 – Social Reflection**

At the first level, individuals rely chiefly upon negative feedback from observers in order to guilt or shame them into changing their behavior. In a college classroom *tragedy of the commons* exercise in which students were incentivized to be self-interested, participants gradually learned to temper their self-interest in subsequent rounds of decision-making after being shamed by fellow students left with fewer resources. Eventually, all students showed preference for mutually lowered returns in favor of equitable and sustainable longer-term outcomes. This example demonstrates the power of shame avoidance in inhibiting negatively impactful behavior.

**MSA Level 2 – Self-Reflection**

At the second level, individuals become more self-reflective. Rather than relying solely on outside observers to bring negative impacts on others to their attention, actors themselves start to take on the role as their own source of feedback. This occurs by following the positive example of others. In another classroom experiment, subjects were 2.5 times less likely to litter in a room containing swept litter than in a litter-strewn room. Observing the swept nature of the litter informed them that a clean room is desirable, thereby increasing their propensity to join in to help keep the room clean.

**MSA Level 3 – Anticipatory Self-Reflection**

At the third level, individuals start to become forward looking, foreseeing potential future negative impacts on others before acting. This forward-looking behavior that often comes after self-reflection on prior behavior has led to an internal sense of guilt or shame. For example, at a crucial turning point in the above-mentioned *tragedy of the commons* experiment, one student anxiously asked aloud, “are we bad people?” in an evident attempt to reconcile a glaring inconsistency between prior action and self-perception.

**MSA Level 4 – Proactive Self-Reflection**

At the fourth and highest level, agents become increasingly forward looking, considering not just their potential negative impacts on others but also their potential positive impacts, and

actively engage in appropriate actions to realize those positive outcomes. At this level, individuals internalize the ideal of the self as potential hero rather than potential villain. By recognizing their place within a broader system and taking positive actions to improve it, agents self-actualize by benefiting others. At best, these decisions are conscientiously habit-forming, bringing persons closer to becoming whom they aspire to be (Table 1).

**System-Theoretic Dynamic**

MSA leveraging can gradually result in virtuous managerial and employee behavior, being crowded-in across the entire system. This process is structurally reinforced system theoretically. Systems theory is an ecologically inspired approach to describing the interrelated nature of complex systems, such as the different moving parts of a firm, namely, manufacturing, research and development, supply chain, finance, human resources, marketing, etc. Given this interrelation, levers can be pulled by actors in certain parts of the system that will have immediate or delayed effects in other parts of the system, which will in turn create feedback for future decision-making. This approach has been used to describe numerous organizational logics including structuring human resource practices for sustainability strategies. For example, this approach worked well for [Amazon.com](https://www.amazon.com), a company once widely criticized for wasteful packaging. After years of social media backlash, the company developed a series

**Moral Self-Awareness, Table 1** Four stages of moral self-awareness

|                                                | Recognition of Externalities                        | Externality Focus | System Theory Focus                            | Motivators        |
|------------------------------------------------|-----------------------------------------------------|-------------------|------------------------------------------------|-------------------|
| Level 1<br><b>Social reflection</b>            | Via others                                          | Negative          | Feedback                                       | Guilt/Shame       |
| Level 2<br><b>Self-reflection</b>              | Via reflection on outcomes achieved by others       | Negative          | Self-feedback                                  | Guilt/Shame/Pride |
| Level 3<br><b>Anticipatory self-reflection</b> | Via forward-looking consideration                   | Negative          | Self-feedback with consideration of the System | Guilt/Shame/Pride |
| Level 4<br><b>Proactive self-reflection</b>    | Via self-actualization of one’s internalized values | Positive          | Consideration of the System                    | Pride             |

Adapted from Friedland and Cole (2019), Friedland (2019)

of new packing systems to reduce its carbon footprint. This produced lowered shipment sizes via reuse of original packaging and combined shipments of multiple orders, which in turn improved shipping algorithms, optimized transportation networks, and increased efficiency in storage and distribution, totaling millions in savings.

### **Activating Consumer MSA via AI**

For MSA to function as a positive motivational tool requires clear conceptual framing and messaging to relevant stakeholders via management and marketing. Instead of appealing solely to financial incentives, the appeal is directed to moral self-image. Of course, for this to be effective, it needs to be in an area with an obvious social or ethical component. Once this connection is plainly and clearly articulated, various strategies can be used in order to guide actors up the scale from the first to fourth levels. A rapidly growing area is in the use of artificial intelligence (AI) for activating consumer moral agency.

Showing notices embedded in digital choice architectures can provide users with snapshots of their behavior, for example, time spent online or steps taken in a day. Such notices allow actors to take greater control of their own behavior through positive habit-forming that demonstrates to themselves – and to others – that they are becoming whom they aspire to be. Such experiences are self-affirming and personally gratifying as users gradually move from the lower levels of self-awareness where negative feelings like guilt and shame primarily drive moral behavior, toward the higher levels where positive aspirations are the main encouragement. Allowing users to share their progress with others in a social context further enhances the effects. Five lifestyle categories in particular hold significant potential for this type of innovation: health and well-being, sustainability, media and civics, skill maintenance, and personal edification:

#### **Health and Well-Being**

Myriad health and wellness apps are already in existence, from personal fitness, mindfulness and

sleep management, to screen-time settings on cell phones and personal computers. Smart refrigerators are another frontier. For example, showing notices highlighting patterns of consumption of sugary, highly-processed, canned or frozen versus fresh food, including calorie counts could help users improve their nutritional habits. Combined with data from grocery delivery services, such notices can guide consumers to order groceries according to healthier recipes and locally or sustainably sourced products, based on personal preference.

#### **Sustainability**

Investors can also be encouraged to make responsible choices that align with their social values. Some apps highlight possible ethical concerns in financial portfolios, flagging optional sectors to avoid things such as alcohol, petroleum, and tobacco and potential trouble spots firms may be involved in. Smart refrigerators could also provide consumers with the carbon footprints of groceries purchased. Such notices could extend to other areas, such as air and water pollution, resource depletion, and green packaging.

#### **Media and Civics**

Media-quality applications can use showing notices to alert users to misleading or biased news sources, either case-by-case or in overall news consumption. They can also allow users to curate their newsfeeds for decreased partisanship and increased factual reliability, nudging users out of ideological echo chambers. Similarly, smart citizen phone apps can allow users to develop localized crowd-sourced maps revealing problem areas for litter, broken street lights and windows, vandalism, poor air or water quality, pot holes, etc. Aptly designed interfaces can encourage residents to increase their civic awareness and engagement on local, national, and global levels, prompting them to take action when and where help is needed.

#### **Skill Maintenance**

Our tendency to outsource tedious tasks to technology may lead to significant losses of ordinary skills. GPS maps and autonomous vehicles are

cases in point. When following visual or voice commands, users no longer rely on landmarks for orientation. Showing notices can offer a potential corrective, whereby AI-enabled systems could describe a route with 3-D images of key landmarks where the next turns must be made. This would allow users to orient themselves to their surroundings and acquire memory of the landscape. Other designs could encourage drivers to stay alert and maintain their driving skills so that they may be able to continue driving should the automated system crash or fail.

### Personal Edification

Ultimately, what aptly designed MSA-leveraging systems provide is technology that acts less like an object and more like a coach that helps users develop to their fullest potential. AI systems can hence encourage greater discernment in domains such as the arts, cuisine, fashion, and entertainment. Instead of exposing users to whatever products they may react most impulsively to, they could show alternatives with high quality ratings based not merely on popularity but also on a blend of expert opinion and personal and shared social preferences. Users could also be given increasingly fine-grained rating categories as their sensibility improves.

AI-assisted platforms provide consumers with extraordinarily powerful tools for controlling and managing their daily lives, activities, and interactions. If designed to leverage MSA, such technology has the potential to activate virtue and enhance well-being on a massive scale. But if designed shortsightedly, without features to counteract its own negative habit-forming effects, it can instead foster widespread passivity, ignorance, vulnerability, and irresponsibility.

### Moral Simpliciter of Ethical Giving

Sanjit Chakraborty  
Indian Institute of Science Education and  
Research Kolkata, Mohanpur, West Bengal, India

### Synonyms

Charitable giving; Consequentialism; Decision theory; Philanthropy; Universalized principle

## Introduction

Uniformity in human actions and attitudes incumbent with *the ceteris paribus clause* of folk psychology lucidly transits moral thoughts into the domain of subject versus object-centric explorations. In *Zettel*, Wittgenstein argues, “Concepts with fixed limits would demand uniformity of behaviour, but where I am certain, someone else is uncertain. And that is the fact of nature.” (Wittgenstein 2007, 68). Reflecting on the moral principle of “ethical giving” revives a novel stance in modern moral philosophy. An “ethical giving” is a moral position that looks at giving from the context of harmonizing the changing demands of situations with normative ethical principles. Despite giving more prominence to the query of intuition, the chapter brings up the justification of normative moral principles pertaining to their applications and purports. Human activities aimed at decision-making goals conducted by the moral compass are nothing but the sanction of certain ethical norms and rules. In this context, two principles, the *normative aspect* and the *perspective aspect* need to be expounded in parallel.

The *perspective-based* principle seeks practical guides to action, whereas the *normative aspect* principle looks for the concrete moral justification behind it. Normatively based moral decisions hinge on the probabilities and interests of agents that can sometimes lead towards a better choice. Thomas Nagel’s thought sounds more appealing, since his idea of practical conflict bends towards “...conflict between values which are incomparable for reasons apart from uncertainty about the facts.” (Nagel 2013, 128). Positions on moral personality and equality of justice collide with the conception of verities of the agents’ reason that cogitate a minimal aspect on the morally significant properties (range properties), which can hardly be possessed by all human beings equally. This argument sounds reasonable in light of Singer’s thought of “the principle of equal consideration of interests.” (Singer 2003, 21–22)

The concern of this section is deliberative about how an agent could balance the demand of moral situations and the spirit of the moral

principle devoid of being close to the relative truth. The conception of the moral decision remains capricious in line with the agent’s mood, time, and situation. The germane queries are:

- (a) How could one get the *simpliciter* of moral balance in “ethical giving” or offering help to the poor, orphans, and so on, who need helps from the agents and society?
- (b) Can we find any *universalized principle* in defense of ethical giving?

## Entangling with Moral Values

If we look from a different angle, you may ask how we could try to influence one to make decisions by appealing to what one should do. Inspiring an individual to execute moral action seems a social function that makes claims upon moral sentiments. From this point on, norms inform the social endeavors as we persuade others to carry these out. Our personal moral exhortation (for instance, “Lalon doesn’t like the Valentine celebration”) cannot be a norm, since it has no social accords. Actually, norms are based on ethical principles that have been articulated and supported by a group of people. One can ask, “whether the values are entirely the result of a *manmade process* with some fact-centric experimental mode?” If we think so, then does it not follow that the culminating values from the fact would be a *situation centric* appeal?

Another interesting question is, if we take an anti-realist stand regarding the emptiness of objective reality, then the process of resistance leads us to the “subjective” way of understanding values. The concern is whether the subjective way of understanding value could mingle with universalized principles like “Always speak the truth,” “Always respect women,” and so on? This reflection is the specter of an added type of question-begging: how could we strive for “universalized moral principles?”

Moral values appear subjective because they can differ according to varied cultural backgrounds and the subject’s preferences. Moral values can also appear objective, as they are held by people across various cultures, and the polygonal belief-desire psychology is arguably

universal. Suppose we adopt a liberal view on the idea of objectivity. In that case, we will notice that our subjective experiences influence our knowledge of the external world. Yet, it is undoubtedly objective as our knowledge of the external world is open to “inter-subjective verification and agreement.” (Chakraborty 2018, 49–50). The principle of universalizability gets a strong position here. Singer writes:

...the universalisability of ethical judgments requires us to go beyond thinking only about our own interests, and leads us to take a point of view from which we must give equal consideration to the interests of all affected by our actions. (Singer 2003, 315)

One can opt for a non-universalizability principle and hinge on their interests, but the principle will collide with the Kantian advocacy “Act only on that maxim through which you can at the same time will that it should become a universal law.” (Kant 1972, 84). This is apparent enough on the surface. We think the term “reason” is a universally and objectively valid principle similar to the concept of freedom. More specifically, we believe that morality cannot be subjective as it depends on the situation, and it also manipulates the communication process towards disagreement. But it would be a peculiar thesis if we argue that moral values draw from an objective set of natural principles, because without the conscious being, morality does not have any existence. Only the self-reflection or conscience of a human being can think and behave based on conscience. Moral values are an indispensable part of humans’ conscience that holds normative outlook.

In Rawls’ sense (Rawls 1999), people should not be restricted by others’ presumptions regarding what one should be worthy to act upon or think about. The Kantian view also opposes any kind of coercion against rational human thoughts and freedom. In Korsgaard’s words, “We are bound only by restrictions that spring from the requirement that everyone’s liberty or autonomous pursuit of her own conception of the good should be equally protected.” (Korsgaard 2018, 25)

Before taking care of the charge of analyzing the principle that a moral agent should give with

the *provision* that their giving to the extent of *x-amount* must not affect somebody else’s interest or even the agent’s own interest, here a moral agent may prefer to stress the concept of moral values that underpin the self-interest and the moral balance (impartiality) together.

### Decision Theory and Consequentialism?

Decision theory advocates a reason-based underlying approach of an agent’s moral choices that could turn out to be challenging in terms of some practical conflicts of values. The practical conflict emerges when the agents are aware of the distinction of the alternative courses. That is, they are assured about the facts or the consequences of their action that they prefer but are unable to bring together the decision into a single evaluative judgment. In the case of exceedingly balanced choices of different actions, it would be consequently uncomplicated to reach a decision from an arbitrary level, like choosing between Harvard University and Princeton University as an institution for pursuing a degree in philosophy. However, for one who advocates reason-based choices, where the act of reason becomes more pertinent, arbitrary choices look untenable.

But the conflict arises when we focus on the delineation of values. We both have an obligation and general rights together, and most people experience a conflict in determining these in a single judgment, like children who have a lot of responsibilities to their teachers and schools, but who also have the general right to think in their ways that often collides with their parents and teachers’ consciences and policies. Besides, the intrinsic nature of value initiates the dominance of objective values based on utility or benefits that an agent preserves. But the commitments or the utility approaches of an agent should not go against the agent’s self-interest. Similarly, one’s decision should be underpinned not only by self-interest but by the interests of others as well. Still, the question that bothers one’s mind is how a mode of decision could become absurd? Nagel argues,

For example: never infringe general rights, and undertake only those special obligations that cannot lead to the infringement of anyone’s rights; maximize utility within the range of action left free by

the constraint of rights and obligations; where utility would be equally served by various policies, determine the choice by reference to perfectionist ends; and finally, where this leaves anything unsettled, decide on grounds of personal commitment or even simple preference. Such a method of decision is absurd, not because of the particular order chosen but because of its absoluteness. (Nagel 2013, 131)

So, here the absurdity of a particular decision depends on the unbalanced pursuit of probing absoluteness. It turns towards an unsteady circle as it has hinged unreason by prioritizing the hypothesis that a utility approach cannot prevail over an incurred obligation.

Consequentialism, another normative stand, supports normative properties depending on their consequences. Frank Jackson urges,

Consequentialism approaches the question of whether an action is right or wrong in terms of a comparison of the possible outcomes of the action with the possible outcomes of each available alternative to that action. The notion of a possible outcome of an action is interpreted so as to include the action itself and the comparison of the various outcomes is carried out in terms of a consequentialist value function. (Jackson 1991: 462)

The different variations of consequentialism like hedonism, universal consequentialism, act consequentialism (morality of an action depends on actual consequence), evaluative consequentialism (morality of an action relies on the value of the consequence) establish their claims in a logical-cum-ethical manner. It would be puzzling to execute all values in a single ground of judgment; so far, pluralistic values marginalize rigid individualistic values and advocate context-sensitive values in particular situations. Besides, a *utilitarian right* that maximizes respect for moral rights in Rawls' work *A Theory of Justice* (Rawls 1999) synchronizes the "justice of fairness" anchored in the constitutive idea of "original position" by underscoring impartiality for the individuals who have a reasonable conception of justice. Equality is not something that can be measured by an individual's external affairs and physical body. Rawls points out that all human beings are equally possessed of moral responsibility, a property that is undoubtedly related to the sense of justice or

being concerned with the conception of moral appeals. Rawls writes:

I have said that the minimal requirements defining moral personality refer to a capacity and not to the realization of it. A being that has this capacity, whether or not it is yet developed, is to receive the full protection of the principles of justice. (Rawls 1999, 445–446)

There may be some controversies, since it somehow minimally entertains the principle of equality, as does a choice for Amartya Sen's argumentation in support of Rawls' dictum. Sen writes:

Equal personal liberty is given priority over the demands of the second principle which relates to the equality of certain general opportunities and to equity in the distribution of general purpose resources. (Sen 2009, 59)

The notion of balance most concerns liberty, justice, and equal consideration. These are not only bound by others' interests in the stage of distributive equality apart from there being a personal sense (subjectivity), but difficult to find equality in an exact sense. An "egalitarian" approach vindicates *equality for something*, not from a definite ground, as one variable of equality may differ from the other variable of equality maintained by a non-egalitarian stance. Equality may conflict with the pervasive diversity of humans. Because of the focal variables that have some internal pluralities, it may lead towards inequality, as Sen admirably articulates in his book *Inequality Reexamined* (Sen 1992). This is perhaps to go too far, but a significant numbers of philosophers are inclined to concur with Sen to the extent that freedom submerges in rational control.

What matters for human beings is to dispose of giving more to a charity that nourishes the requirements of compassionate persons than to one that simply cites statistics or newspapers reports. No amount of moralizing is going to prevail over such an elemental, evolutionarily embedded retort. An agent would require a clever advertising campaign to maneuver our normal responses in the desired direction. If we mount moral giving as an agent's subjective choices instead of group choices, then the conception of ethical giving will mislay its universalized stance. The

“universalized principle of ethical giving” indicts against any sorts of subjective etiquette.

This is a picture of ethical life that goes beyond personal interest by taking account of the interests of others. Although it seems inevitable that almost all our moral conduct and decisions will be concerned about our own or others with whom we maintain good relations, living an ethical life always enshrines ethical conduct and moral decisions from an altruistic sense that goes towards humanity and global welfare. In an Aristotelian dictum, becoming virtuous is a constant practice of virtue and moral conduct like becoming a good *lyre-player* (Aristotle 2009, 11). Ethics is an inevitable part of human life and the choice of doing moral acts for humanity, in general, is a sort of ethical ramification of an individual’s moral decisions that hinge on the ways they live and act in the world. Rationality and intelligence can facilitate us to resolve our moral ambiguities. We would not probe into here the idea of the good and its controversy on whether the concept of the good is an attributive or predictive adjective etc. One may be fascinated to revisit Williams’ analysis on Aristotle’s weakness on the good that is called the “Gauguin problem” (Williams 1972, 70–71).

To find out a moral *simpliciter* is doubtlessly a difficult task. We can partially relinquish it to the subject’s moral conscience. On the face of it, considering personal connection should never be allowed; but if the giving is morally justified, then it must be done irrespective of whether the recipient is a friend or loved one or not. The spirit of all ethical principles is to promote the good; keeping this in mind only, the agent must respond to situational facts. And that is universalizable as it will apply in all relevantly similar situations. One criterion that sounds promising is the motivation or principle of the particular person who prefers to engage with some charitable works. A person who has a moral disposition in pursuing charity for self-interest or a person whose motivation is to do charity for the sake of charity itself or others interest without being deluded by any personal interest usually delineate a different valuation. Leaving aside some general opinions, if we

prefer to draw out the moral standard of an agent’s charity or moral acts, we need to refrain from the self-interest or personal profit of the particular donor. The foundation of the practical reason of doing something (i.e., charity) for poor or incapable persons, who require our attention and help, should be guided by compassionate ground and more especially from the perspective of “Equal respect for conscience.” (Nussbaum 2013, 59–97)

The orientation of morality is a checkpoint that engenders the usual upshot of prudence for the subject and others in an integrated sense. But a completely synchronized human being is fully incorporated with the collisions of moral disciplines, and charity sounds more ambitious as Aristotelian depicted or the Bhagavad Gita cultivated. Human beings are the amalgam of self-interest and other-interest concerning sensibilities and moral obligations. They are neither static nor a determinate alliance of moral values even if it seems categorical and inescapable. Singer says, “If we are to make properly considered ultimate choices, we must first become more aware of the ethical ramifications of the way we live.” (Singer 1997, 201). Morality in the human sense is a sort of deliberative choice that one can practice and carry out in their wills within the sphere of moral rules and conducts maintained by the society or the world in a broader nuance. We should give the highest deliberate priority to the moral consideration that should be equally beneficial for us and the others of the world.

## Introduction

Max Weber's (1976) seminal work identified Protestantism as a major factor in the success of capitalism in Europe. Weber noted that Protestantism could be distinguished from other Christian faiths, particularly Catholicism, and some other major religions in that it brought spiritual values into the everyday operation of capitalist work systems by advocating thrift, hard work, and diligence in the service of God. Thus, for example, although Protestantism professes an omnipotent God who knows what individual lives are inexorably destined to become, it strongly encourages our struggles to improve ourselves in the sight of God in our daily lives, despite our inevitable and predetermined destinies. This immanent form of religious belief, unlike, for example, Catholicism where the service of God is strongly separated from the service of mammon, brings God's service directly into the world of industry. Max Weber in *The Protestant Ethic and the Spirit of Capitalism* (1976) argues that Protestantism is a causal variable in the explanation of the emergence of capitalism in Europe. As Ferguson (2012, p. 261) puts it, "It contains one of the most influential of all arguments about Western civilization: that its economic dynamism was an unintended consequence of the Protestant Reformation. Whereas other religions associated holiness with the renunciation of worldly things—monks in cloisters, hermits in caves—the Protestant sects saw industry and thrift as expressions of a new kind hardworking godliness." The capitalist calling was, therefore, religious in nature. Although Weber's thesis has been criticized for not recognizing that some of the initial steps toward capitalism occurred in Lombardy and Flanders prior to the Reformation, and that many reformation leaders held strongly anti-capitalist views (Tawney 1926), Ferguson (2012, p. 265) indicates, "There was indeed, as he assumed, a clear tendency after the Reformation for Protestant countries in Europe to grow faster than Catholic ones, so that by 1700 the former had clearly overtaken the latter in terms of per-capita income, and by 1940 people in Catholic countries

were on average 40 per cent worse off than people in Protestant countries.”

Although Europe has become increasingly secular, Weber’s spiritually based explanation of capitalism’s rise in Europe has recently been seen as a factor in the success of Protestant business enterprises in China, and this aspect is dealt with in more detail later in the chapter.

There can be little doubt that business has been rocked by crises recently. Financial crises have diminished trust both between and within businesses themselves and between businesses and their customers. This turbulence shows little evidence of abating and leads to the need to present a more detailed explanatory analysis of economic benefits of trust and particularly that derived from spiritual commonalities. To show the centrality of spiritualism to business network trust and trust to business efficiency, it is necessary to:

- Present an analysis using the conceptual framework of the prisoners’ dilemma of how trust is a core factor in repeated business relationships.
- Show how trust articulates with bureaucratic control mechanisms. (Trust is presented as being inversely related to administrative and bureaucratic controls and positively associated with network efficiencies.)

Spiritually based value orientations have been shown to be associated with trust enhancements in capitalist networks by Ferguson (2012); however, this entry aims to show the importance and interconnectivity of spiritualism (specifically, in this case, Protestantism) with trust and business network efficiency. To achieve this goal, the entry analyzes interrelations of aspects of trust enhancements brought about through spiritual capitalism on economic costs and network efficiencies using recent Chinese business experiences as exemplars.

Although the entry concentrates specifically on network efficiency from spirituality derived from Protestant religion, because this has a historically well-documented association with capitalism and economic growth, it is in no way meant to suggest that other religions cannot also positively affect economic growth. For example, Barro and

McCleary (2003) indicate in a study of 59 countries that religiously based beliefs in *heaven* and *hell* alone positively influence individual values of honesty, hard work, thrift, and openness to strangers, which are aspects of behavior that have been found to positively impact on economic growth.

## The Concepts of Trust and Distrust

Trust and distrust are not opposites of a unidimensional bipolar construct. “Trust and distrust are not opposite ends of a single trust-distrust continuum and the opposite of trust is not distrust” (Lewicki et al. 1998, p. 448). Trust emerges from positive expectations of a trustee’s behavior, while distrust arises from negative expectations of the trustee’s conduct. Also, it is quite possible for trust and distrust to coexist simultaneously in the same person at different times and in different situations (Lewicki and Tomlinson 2003).

Trust is often conceptualized on a continuum ranging from “thick” to “thin” trust and from personalized to generalized trust (Torche and Valenzuela 2011). “Thin trust and thick trust represent the ends of a continuum,” “thick trust refers to trust with a short radius, encompassing only others who are close to the truster. . .,” and thin trust “refers to trust. . .with a long radius, encompassing people at greater social distance from the truster” (Putnam 2000, p. 466).

Close community-type trust occurs largely on a *personal level* and is distinguishable from *generalized trust* which occurs in impersonal social interaction among strangers (Burt 1992).

Torche and Valenzuela (2011, p. 186) note that trust offers a resource to reduce risks attached to strangers’ freedom to act, without personal thick trust’s more onerous and binding interpersonal constraints. Generalized trust is a modern phenomenon made necessary for reliable social action beyond the domain of “closed networks” (Torche and Valenzuela 2011). Here the risk of trust breakdown is obviously greater but can be diminished by common commitment to a spiritual belief with its expectations of dependable behavior.

## The Concept of Spiritual Capitalism

Spiritual capitalism is defined as a new *sustainable* form of business which emphasizes responsibility and integrity. Here, it refers specifically to the trust element on which enhancements in responsibility and integrity are made. Spiritual capitalism is regarded as promoting “lean trust” of that is it is seen as potentially generating trust deeper than thin trust but less deep than thick trust. Lean trust built through spiritual commonality is regarded as providing a double advantage in the business context by presenting reliable and predictable trust without the costs of bureaucratic controls, while avoiding the emotional entanglements of thick trust.

## The Concept of Network Efficiency

Latora and Marchiori (2001) define network efficiency in terms of information exchange. Global efficiency measures information exchanges across the extent of a given network. Local efficiency measures small network’s resistance to failures in information exchanges. Quantitative models of information exchange efficiency in networks measure the number of nodes and the length of information paths between nodes. Efficiency is seen as the shortest information path between one node and another. Network efficiency analyses tend to adopt quantitative approaches (Latora and Marchiori 2001); however, qualitative aspects of network efficiency such as trust in interpersonal relations also can be expected to affect the speed information passes from one node to another and the number of nodes required for bureaucratic control.

## The Concept of “Lean Trust” and Its Advantages in Business Networks

The importance of “lean trust” behavior in increasing group advantages over other competing groups is most forcefully demonstrated, according to Darwin (1989), not at the micro group level of a nuclear family (thick trust) but at the macro level of a community (i.e.,

community level of “lean trust”). As Darwin (1989, p. 166) puts it, “...although a high standard of morality gives but slight or no advantage to each individual man and his children over other men of the same tribe. ...A tribe including many members who, from possessing a high degree of the spirit of patriotism, obedience, courage, and sympathy were always ready to aid one another, and to sacrifice themselves for the common good, would be victorious over most other tribes, and this would be natural selection.” The “spirit of community” Darwin (1989) alludes to draws on a trust relationship in the community that is thicker than the thin impersonal, contractual-type trust generally found in most businesses yet is distinct from the thick trust which characterizes trust within a family.

Pfaff (2015) suggests all human interactions require trust of some sort, whether they are the thick trust of family relationships or the thin trust involved in purchasing a phone on eBay. We need to feel confident that, in the latter case, those we are doing business with are not aiming to cheat us. Thin trust situations that generally characterize business transactions incur large bureaucratic control costs which impede business network efficiency. In short, when trust is entirely absent, interpersonal relationships necessary for human existence vanish altogether (Pfaff 2015). It follows from this that if “lean trust,” which stands somewhere between thin and thick trust and is evident in “community spirit,” can be established in the business context, it is likely to generate beneficial economic outcomes. As Fukuyama (1996, p. 31) suggests: “A high trust society can organize its workplace on a more flexible and group-oriented basis, with more responsibility delegated to a lower level of the organization. *Low-trust societies, by contrast must fence in and isolate their workers with a series of bureaucratic rules*” (Emphasis added).

## Trust Derived from Personal Ethic and/or Spiritual Belief

Uslaner (2002) suggests that trust encompasses the norms and mores governing giving and

receiving trust: it concerns being trusting and trustworthy to others. Trustworthiness, a closely related concept to trust, can be regarded as reputation arising from personal responsibility shown in reliably fulfilling agreements and obligations, both with people known personally *and* strangers.

### Heuristic Model of Hypothetical Business Transaction Payoffs in Trusting and Untrusting Business Contexts

In the first model (Table 1), “the business person’s dilemma,” hypothetical “payoffs” from spiritual capital are analyzed using a derivation of the prisoner’s dilemma game (Axelrod 1980). There is the possibility of two types of behavior: cooperation (trusting behavior) or defection (untrusting behavior) among two persons. The purpose of the model is simply to show that business trusting behavior is most likely to lead to optimum payoffs for both parties over time. Trusting behavior proves to be the most favorable iterative strategy.

In Table 1, cooperation corresponds to trusting business behavior, while defection is seen as untrusting behavior. Two time periods,  $t_1$  and  $t_2$ , are considered. The  $t_1$  period refers to first-time business transactions with a business person. In the first-time ( $t_1$ ) business interaction, both parties have no knowledge of the other’s likely business behavior (whether they are likely to cooperate or defect). Table 1 shows hypothetical payoffs at  $t_1$  and  $t_2$ .

If both act trustingly (cooperate) at  $t_1$  and  $t_2$ , they both receive a three-point payoff as transaction costs are relatively low because both parties

behave in a reliable and predictable way. If both act untrustingly (defect), in the first round, they each receive only a one-point payoff because the transaction costs are increased considerably by additional checks required to verify the reliability of the other’s behavior. In  $t_2$ , such mutually untrusting behavior would mean that business might not take place at all (zero payoff) or that it would continue with heavy transaction costs (one-point payoff).

Finally, if one business person acts trustingly (cooperates), while the other behaves untrustingly (defects), the payoffs are, respectively, zero points and five points to the business persons. The defector makes a “profit” (five points) by “duping” the cooperator in the transaction who obtains zero or even minus points from the transaction, depending on the extent and depth of the duplicity. Assuming the unscrupulous business person gets away “scot-free,” he/she wins total profit *in the short term* ( $t_1$ ).

If both business persons behave untrustingly (defect) in the first round ( $t_1$ ), they will receive zero from business at  $t_2$  as there is unlikely to be further business.

Why should business persons behave in an untrusting manner? Zhao (2011) suggests:

For many people in this market environment, the reason why they do evil things is because the overall market environment is not very good. Under these not-so-good market conditions, they utilize this method of doing evil things to protect themselves. Or when they predict that other people might do evil things to them, they do it first. We call this the ‘prisoner’s dilemma,’ in which people do bad things not because they are bad people but because they worry that others would ruin them, so they ruin others first. This kind of behavior we find very common in the marketplace.

If trusting (cooperative) behavior in the first round is continued in the second round, both parties achieve a three-point payoff, and, as trust deepens over time, transaction costs can be expected to decline and payoffs increase. Such cooperative reciprocity can be self-policing so long as the probability of future reciprocity makes cooperation stable. Unlike in the traditional tit-for-tat outcome, the development of trust produces benefits well beyond a specific transaction by generating loyal business and customer

**Moral Spiritualism and Network Efficiency, Table 1** The business person’s dilemma. (Adapted from Coldwell 2016)

| Business person’s behavior | Trusting             | Untrusting               |
|----------------------------|----------------------|--------------------------|
| Trusting                   | $Tt_1 = 3, Tt_1 = 3$ | $Tt_1 = 0, U = 5$        |
|                            | $Tt_2 = 3, Tt_2 = 3$ | $Tt_2 = 0, Ut_2 = 0$     |
| Untrusting                 | $Ut_1 = 5, Tt_1 = 0$ | $Ut_1 = 1, Ut_1 = 1$     |
|                            | $Ut_2 = 0, Tt_2 = 0$ | $Ut_2 = 0/1, Ut_2 = 0/1$ |

networks and by indicating new business opportunities. Thus, building and consolidating trust in “tit-for-tat” business transactions can lead to enhanced economic payoffs and benefits. Zhao (2011) points out, “If this market consists of more people with morality, then we can discover that it does not matter whether we talk of externalities or of the prisoner’s dilemma . . . these phenomena would decrease. This is especially so if they do business with one another *within a group of moral individuals*. Then, they can form mutual trust among them. They will have a common position and a common relationship based upon trust” (Emphasis added).

### A Heuristic Model of Network Efficiency and Trust Interfaces

Figure 1 presents a heuristic model of the effects of different kinds of trust on network efficiency. In general terms, the model suggests that as trust increases among business persons, from “thin” to “lean” trust, there is a corresponding improvement in network efficiencies through the elimination of bureaucratically required nodes now made redundant, the shortening of distances between nodes, and the quickening of communications between nodes.

Figure 1 indicates how “lean trust” can improve network efficiency. The model suggests that for low levels of trust such as the thin, bureaucratically bolstered trust commonly found in businesses, network efficiency tends to be low and

transaction costs correspondingly high. The bureaucratic control that thin trust requires in “normal” business situations creates extra nodes for checking particular transactions and slows down business communications. However, the model displayed in Fig. 1 also suggests that as trust increases to “thick trust” levels, network efficiency tends to decline because the intensity of the emotional bond slows down network communication, shortens the potential *span* of the network (as in the case of Chinese *guanxi*), and adds economically inefficient baggage.

The network improvement brought about by lean trust generates economic benefits by reducing transaction costs and the lengths of bureaucratic structural lines (and their staffing), speeding up business decision-making, adding social capital, and generating worker and customer loyalty. Lean trust of the kind derived from spiritual capital, helps run and maintain networks more efficiently, and increases the rewards of trusting, cooperative businesses.

Beneficial effects of such trust-based networks are evident in the superior economic performance of companies embracing spiritual capitalism in China.

### The Protestant Community in China

Chua of the Harvard Business School points that business networks in the USA and China are built on different approaches (Working Knowledge, 2009). American managers *separate* work from their personal relationships and behave impartiality and objectivity when dealing with workplace issues. Chinese managers prefer to have their work and personal relationships merged together. For example, Chinese *guanxi* networks are built on “thick trust” involving personal socioemotional ties which encourage considerable overlap between business and personal relationships.

From examples of US and Chinese management networks, Chua (2009) distinguishes between premises on which trust can be built. According to Chua trust can be built “from the heart” (affect-based thick trust) or “from the head”

**Moral Spiritualism and Network Efficiency, Fig. 1** Network efficiency and trust interfaces. (Adapted from Coldwell 2016)

cognition-based “thin trust,” with the latter usually requiring bureaucratic structures as controls. Affect trust focuses on care for the welfare of others in a relationship and their intrinsic value. Affect-based trust is driven by feelings and emotions. Cognition-based trust emanates from recognition of the other’s competence and reliability in specific situations, underwritten by formal bureaucratic controls. Weber’s theory on the emergence of the capitalist spirit in the west through Protestantism indicates the importance of affect-type (lean) trust built from spiritual beliefs.

Tong (2012) notes that Weber’s essay entitled “The Protestant Sects and the Spirit of Capitalism” suggests that belonging to business communities with common belief systems provides a level of trust which goes beyond the “thin trust” norm in the business context. As Towse (2013, p. 59) puts it, “. . . we trust information that comes from people we know. . . . personal networks provide psychological support as well as information and resources.” The benefit of spiritual capitalism in networks derives from the fact that, in business situations where impersonality tends to prevail, “lean trust” engenders sustainable business environments without the burdens and constraints imposed by thick trust. “Lean trust” business networks based on spiritual beliefs also have span advantages over Chinese *guanxi* business networks as the latter tend to be limited to the size of specific extended families. Clearly, the finite boundaries of extended family size impose greater constraints on network development than business networks comprising people joined in relationships through common spiritual belief.

Lean, spiritually based trust networks are better able to provide up-to-date information that helps locate business opportunities (Hendry et al. 1991; Mulholland 1997) than thin, bureaucratically based business networks. “Lean trust” networks also provide better network access to limited resources (Burt 1992) and generate higher levels of commitment, loyalty, and trust among workers and customers (Bates 1994).

Tong (2012) presents a good example of the benefits of “lean trust” with the example of “ZD” a businessman whose business network is based on

Christian spiritualism and generates a large number of loyal customers. ZD remarking on the advantages a spiritually based network provided in recruitment and selection of personnel states: “It saves us a lot of money to find a suitable candidate to fill the post in our company. . . . You inform him [the manager] what you want, and he can find a suitable person for you. I think he is not only helping us to find employees, but he is also matching Christian employees with Christian bosses; it is like sending and putting people into the right places. So I see it as ministry and not only business” (Tong 2012, p. 115). In such circumstances the thin trust systems that operate in most business bureaucratic networks would require, *inter alia*, the intervention of a recruitment professional, a formal selection process involving an interview, and follow-up credibility checks of the candidates. And, even after the selection process has been completed, this thin trust-based bureaucratic process involves an increased risk of employing misfits, whereas lean trust emanating from spiritually based networks can make such transaction-type costs less laborious, costly, and time-consuming.

## Movies and Business Ethics Training

Simone de Colle 

IESEG School of Management, Paris and Lille, France

## Synonyms

Movies as pedagogical tool in business ethics training

## Introduction

Business ethics training refers to the introduction of the key concepts and approaches of moral reasoning to so-called practitioners, that is, employees, managers, entrepreneurs, members of NGOs, and public officials who need to be able to apply the business ethics approach to solve real, business-related issues in their professional life. These training programs are also relevant – and, in fact, getting more common – for graduate students in general MBAs and in specialized Master Programs.

The audience for business ethics training, delivered both within universities, business schools, and other educational organizations – like the Institute of Business Ethics (IBE) in Europe and the W. Michael Hoffman Center for Business Ethics in the US – and in the form of in-house corporate training through dedicated programs, may include managers and employees across virtually all functional areas (e.g., Finance, Procurements, Marketing and Sales, Human Resources, Legal, Health and Safety, etc.). Additionally, business ethics training is particularly important for executives whose main responsibility is, in different ways, directly linked to the design, management, monitoring, and reporting of the organization’s ethics program, such as Corporate Ethics Officers and their staff, Compliance Officers, experts in ethical investigations, staff of Speak-Up and other internal reporting functions,

Corporate Social Responsibility (CSR) and Sustainability Directors.

The main theoretical concepts and frameworks that are applied in business ethics training clearly overlap with those used for business ethics teaching, which generally aims at:

- Understanding the key concepts of the main normative ethical theories (e.g., deontology, virtue ethics, and utilitarianism);
- Enabling participants to apply these moral frameworks to analyze moral dilemmas;
- Appreciating the influence of situational (e.g., authority, incentives, organizational culture, etc.) and individual factors (e.g., ethical blindspots, cognitive biases, unconscious drives, etc.) on ethical decision-making processes; and
- Stimulating personal reflection on values in life and business.

Additionally, according to the IBE (2021), the goals of business ethics training delivered to executives include:

- Raising awareness of what is acceptable business practice and where support can be found, for example, in the code of ethics;
- Raising the ethical sensitivity of staff so that they know when a decision they are faced with involves an ethical choice.

Compared to general business ethics education, business ethics training has therefore a stronger practice-oriented focus to enable executives to make ethical deliberations and demonstrate ethical behavior not only with the help of the normative ethical theories, but as well in light of their own organization's (and profession's) informal values and formal code of ethics. In other words, according to IBE the purpose of business ethics training is to develop "ethical capabilities" of staff and executives to support legal and regulatory compliance (ethics as protector) and strengthen the business (ethics as enabler).

This more practice-oriented form of executive education offers many opportunities to constantly innovate training approaches and educational

content, adapt to the specific audiences, and maintain the training as relevant and updated as possible.

One of the ways to deliver business ethics training that has become more widespread in the new millennium is the use of movies (as well as documentary films and series, available on TV and through many digital platforms such as Netflix, etc.) as the basis for classroom discussion.

The advantages of using movies in business ethics training include at least six aspects:

1. Help to focus in depth on a clearly written (and portrayed) business ethics issue, typically in around 90 minutes (making the *case-study* method more effective);
2. Enable participants (viewers) to empathize with the human side of business (*reducing psychological distance*);
3. Foster participants' *moral imagination*;
4. Movies are a form of contemporary art that can foster our sense of beauty and have positive relationships with ethics (*pedagogical value of art*);
5. Watching movies is engaging, entertaining, thought-provoking, and fun! (*enhancing classroom engagement*);
6. Movies are a great integration to face-to-face teaching (*supporting blended learning*).

The sections below discuss each of these aspects more in detail. It also provides numerous examples of popular movies to illustrate specific benefits of using them for the purposes of business ethics training.

### **Making the Case-Method More Effective**

The case-method is the preferred approach for teaching business ethics, as it enables education of students in the most important goal of business ethics education, that is, to apply (*general, abstract*) normative ethical theories to address (*specific, practical*) problems in business life. Typically, students are required to read the case before classroom discussion and prepare their answers on some preliminary questions (individually or with their study group). In the classroom, the instructor raises additional

questions and “steers” the discussion in ways that enable participants to reflect on their original answers (*moral intuitions*) and try to create a shared interpretation of the case being confronted with different opinions in the room. This pedagogical methodology is very well established, especially in the US universities, and can just work very well by substituting a written case with a movie. The key element of success for the case-method approach is, in fact, to enable students to put themselves in the shoes of executives of real companies: watching a movie that includes some fictional (but realistic) corporate decision-making might just achieve this goal in a very effective (and entertaining) way.

Focusing a classroom debate on a specific movie can provide plenty of excellent topics for a deep case-study discussion. For example, Werner (2014) illustrates how *Margin Call* (2011), portraying the fictional decision-making process happening in a financial investment bank the night before the start of the 2008 financial crisis, can help participants focus on the different motivational aspects of the different decision-makers in the bank (brilliantly impersonated by a stellar cast including Jeremy Irons, Kevin Spacey, Demi Moore, and Paul Bettany, among others) as well as stimulate a reflection on the influence of power structures, reward incentives, and conflicts of interests in the banking industry. Similarly, Berger & Pratt (1998) examines the ethics of business communication analyzing two movies based on David Mamet’s plays: *Glengarry Glen Ross* (1992) and *House of Games* (1987). Rob van Es (2003) illustrates how to create a workshop on practical ethics around *The Insider* (1999). Finally, Darden Business School decided to produce their own movie to promote business ethics discussions even beyond the walls of their MBA and executive courses: *Fishing with Dynamite* (2020) is a documentary film featuring Darden professor R.E. Freeman and real case-studies of contemporary business and entrepreneurs, reflecting on the key lessons of stakeholder theory.

Together with *Margin Call*, movies like *Wall Street* (1987), *The Wolf of Wall Street* (2013), and *The Big Short* (2015) and documentary films like

*Enron: The Smartest Guys in the Room* (2005) and *Inside Job* (2010) are all excellent basis for case-study discussions on the ethical issues in the financial services industry, the real case of the Enron bankruptcy, and the conflicts of interest and ethical failures linked with the 2008 financial crises.

Other examples of movies that can be used for business ethics training on a specific industry (e.g., the issues within the tobacco industry) or to focus a case-study discussion around a specific issue (e.g., sexual harassment) include:

- *Philadelphia* (1993) to discuss *stigma* and *LGBT rights*.
- *Disclosure* (1994) and *Spotlight* (2015) to discuss *sexual harassment*, *sexual abuse*, and the *ethics of journalism*.
- *The Insider* (1999) to analyze legal and ethical aspects of the tobacco industry and reflect on *whistleblowing*.
- *Erin Brockovich* (2000) and *Michael Clayton* (2007) to discuss the social and environmental responsibilities of corporations and the legal aspects linked with *corporate responsibility*.
- *Thank you for Smoking* (2005), focusing on the tobacco and other controversial industries such as alcohol and weapons, for a discussion on the *ethics of corporate lobbying*.
- *Up in the Air* (2009) and *The Company Men* (2010) to discuss ethical issues in HR management (*downsizing*) and managerial culture.
- *The Net* (1995), *The Social Network* (2010), and *Snowden* (2016) to stimulate reflection on the many ethical issues raised by the impact of technology, use (and abuse) of internet, and industry application of Artificial Intelligence for commercial or military purposes (*privacy*; *cyberbullying*; *cyberterrorism*; *identity theft*; *surveillance*; *internet addiction*).

### Reducing Psychological Distance

Movies show us faces. It may seem a trivial remark, but it has been argued that many problems of contemporary business are due to the fact that managers (and management books) often talk about employees, suppliers, customers, shareholders, and other stakeholders in a

de-humanized way, as “human resources,” “drivers of cost,” or “value generators,” forgetting that beyond these labels and groups there are human beings. Yet, one of the central messages of stakeholder theory is that stakeholders have names, faces, families, and ethical values: managers should never forget that business is a “human institution” and is “fully situated in the realm of humanity” (Freeman et al. 2010). Movies have a strong emotional impact on the viewers that can be very beneficial in this perspective. By portraying the complexity of human personality, movies help viewers to appreciate the human dimension of business decisions – and the effects that they may have on other human beings. Psychologists and behavioral economists argue that separating ourselves from other people spatially, temporally, or experientially – what is called “*psychological distance*” – may have strong influence on our moral awareness (i.e., realizing that our decisions may affect the well-being of other people) and, therefore, our ability to activate a moral reasoning process.

Movies like *Flight* (2012) or *The Wizard of Lies* (2017) are good examples pointing out this aspect. In *Flight*, Denzel Washington plays the role of a commercial air pilot struggling between heroism, personal failures (alcohol addiction), and truth-telling: watching all these tensions and contradictions in a human life through the character played by Denzel Washington enables students to empathize and “put themselves in the shoes” of the protagonist, which is again the key for a successful (and rich) case-study discussion. Similarly, in *The Wizard of Lies*, Robert De Niro’s masterful acting enables students to resonate with complex personality traits a respected businessman (Bernie Madoff, the former Chairman of NASDAQ) who turned into the largest fraudster of the history, running a Ponzi scheme worth about \$65 billion. Beyond the financial elements of the rise and fall of Mr. Madoff (who was sentenced 150 years of prison), students watching this movie become aware of the human tragedy embedded in this “business” story (one of Madoff’s sons committed suicide).

### Fostering Moral Imagination

Movies can be a powerful “philosophical medium” to initiate philosophical discussion around right and wrong practices in business and to stimulate personal reflection on the way we should live our life. More than representing and describing reality, as in a case-study text, movies have the power to push us to imagine different possible scenarios and future development of our society – some of them might be worrying and raising ethical concerns. In business ethics scholarship, moral imagination is an idea rooted in the work of Adam Smith and Immanuel Kant and has been defined by Patricia Werhane as “the ability in particular circumstances to discover and evaluate possibilities not merely determined by that circumstance, or limited by its operative mental models, or merely framed by a set of rules or rule-governed concerns” (Werhane 1999). Developing executives’ moral imagination is therefore very important in order to support the activation of moral reasoning processes within organizations. In fact, Werhane argues that it is precisely the paucity of moral imagination that can explain several decision-making disasters, from both an ethical and an economical point of view.

Movies like *Limitless* (2011), *Contagion* (2011), *Her* (2013), and the TV-series *Black Mirror* (2011–2019) are good examples to stimulate reflection on the ethical issues linked with human enhancement medicine, the challenges of a pandemic health crisis (before COVID-19!), the possible impact of Artificial Intelligence on human interaction, and (several) dystopian futures made possible by the (mis)use of technology.

### The Pedagogical Value of Art

Movies, like literature, poetry, visual arts, and music (which are, by the way, often employed within a movie), are a form of contemporary art. The relationship between art and ethics has been discussed by various philosophers. As the American Pragmatist John Dewey says in the conclusion of his *Art as Experience*, “art is more moral than moralities,” pointing out that art is always beyond the “consecrations of the *status quo*, reflection of custom, reinforcement of the established order”: art has the power to enable us

to imagine possibilities that might be in contrast with actual conditions (Dewey 1934: 362). The beneficial use of art for management education, and, in particular, for business ethics training, has been supported by various scholars. Koehn (2010) points out that discussing works of art in the classroom may be useful both pedagogically, “as a way to develop students’ capabilities for moral reasoning,” and for awareness raising purposes, “as a way to get students thinking more deeply about the differences between ethics and morality, about modern society’s norms, and about the challenges of living in a potentially alienating world that tends to valorize instrumental reasoning.” Purg and Sutherland (2017) argue that the key value of arts is *meaning*, that is, “how the arts afford reflection, conversation, and challenge to the meanings and purposes of what we do.” Therefore, presenting art in a classroom of tomorrow’s managers may facilitate a conversation around *purpose* in their present and future career. Moreover, embracing beauty and hope – central messages in the work of artists – may positively inspire future leaders’ innovation and creativity (Adler 2015). At the same time, it is important that instructors acknowledge “the multivalent relationship between art and ethics and morality” (Koehn 2010), since movies may also disinform, distort facts, indulge in prejudice, and prey on unconscious and unwelcome desires (Cox and Levine 2011). All movies mentioned above might be seen under their artistic value as well.

### Enhancing Classroom Engagement

Most people like watching a good movie. Thanks to great acting, movies are just catalyst of attention – and this can be extremely useful to enhance students’ engagement when dealing with a classroom of MBA students who are moving from one course to another and busy executives who squeeze training hours in their hectic schedule. (Great) movies are popular, entertaining, and enable everyone in the classroom to quickly empathize with the “case-study” represented in the fiction. Even just playing a short clip from a well-known movie might be very beneficial to gain a higher level of engagement in the classroom. A great example is the famous “*Greed is good*” speech delivered by Gordon Gekko, played

by Michael Douglas in *Wall Street*: “*The point is, ladies and gentlemen, that greed, for lack of a better word, is good. Greed is right. Greed clarifies. Greed works. Greed in all its aspects ... greed for life, greed for love, for money, for knowledge.*” By showing this 30-second video in the classroom is, in many business ethics instructors’ experience, a great boost in students engagement: “is one of the best ways to engage student participation and foster the learning process. [...] Film clips give an opportunity to pull ethical issues and conflicts that permeate the business and popular culture into the classroom, and give students a chance to deal with them creatively” (Shaw 2004).

### Supporting Blended Learning

Especially in the last decade, with the rise of technological innovation and applications to record videos and online streaming, there has been a great increase of online business ethics training offerings. Offering courses online clearly has the benefit to potentially reach a global audience and reduce costs and the need for travel. The COVID-19 pandemic has undoubtedly contributed to accelerate this process. While most of the benefits of business ethics education are best achieved with face-to-face training, the opportunity to design some form of blended learning, that is, courses with both online activities and face-to-face learning, has been pursued by most universities, business schools, and other educational centers. Clearly, including movies in a business ethics training can ideally support this form of blended learning via streaming a movie simultaneously online to participants across the globe or allowing participants to watch the movie offline and come to class (either face-to-face or online) for the follow-up discussion.

## Multiculturalism and the Ethics of Immigrant Integration in the Twenty-First Century

Arjun Tremblay  
Department of Politics and International Studies,  
University of Regina, Regina, Canada

## Synonyms

Minority accommodation; Polyethnic rights;  
The politics of recognition

## Definition

Multiculturalism is increasingly being used to describe an ethical alternative to the process of cultural assimilation and, more precisely, a way in which governments can “ensure that the terms of integration [for minority cultural communities borne out of individual and familial immigration] are fair” (Kymlicka 2001: 162). In immigrant-receiving societies, public institutions (e.g., courts, public schools, legal frameworks, and the military) tend on the whole to reflect the languages, customs, and/or religion of the majority; this may, in turn, prevent members of some minority cultural communities from being able to fully exercise their citizenship rights and to participate in the political, social, and economic arenas of the receiving society. Traditionally, immigrant-receiving societies sought to assimilate immigrants into dominant cultures and languages in order to facilitate their political, social, and economic integration. By contrast, multiculturalism policies are designed to recognize diversity and intended to accommodate cultural, religious, and/or linguistic differences. The accommodation of difference can entail implementing exemptions from general rules (such as allowing a Sikh police officer to wear his turban instead of regulation headwear) or providing assistance in interactions with public institutions (such as producing official governmental forms in minority languages or having a minority language interpreter available for on-sight communication with government officials). The first official multiculturalism policy was adopted in Canada in 1971; following that, a number of immigrant-receiving countries have implemented their own multiculturalism policies.

To be clear, multiculturalism is a polysemic concept. The word multiculturalism is sometimes used in public discourse to describe demographic diversity in terms of language, religion, race, and/or ethnicity. In popular discourse, multiculturalism is generally equated with the celebration of the customs, traditions, and cuisines of cultural minorities. Political theorists (e.g., Taylor and Gutmann 1992) have used multiculturalism as a synonym for a “politics of recognition” in liberal democracies that must, on occasion, allow the pursuit of collective goals to trump the protection

of individual rights. And, during the late stages of the twentieth century, political activists began to employ multiculturalism as shorthand for a worldview that ascribes equal value to all cultures and advocates their equal representation across public institutions.

### Historical Origins, Ideological Roots, and Recent Developments

Multiculturalism as public policy is a distinct and characteristic phenomenon of the age of migration and, more specifically, of the late twentieth and early twenty-first centuries. The first official multiculturalism policy was adopted in Canada on October 8, 1971. On that day, and in response to the findings presented in the *Report of the Royal Commission on Bilingualism and Biculturalism, Book IV: the cultural contribution of the other ethnic groups* (1969), Pierre Elliott Trudeau, the then Prime Minister of Canada, declared that the Canadian government would heretofore implement a policy of “multiculturalism within a bilingual framework.” This policy change was guided by a moral imperative to recognize the importance of group belonging and by a pragmatic desire to enhance the life chances of ethnic minorities in Canada (Trudeau 1971).

Canada deepened its commitment to official multiculturalism in 1982 when the Canadian constitution was repatriated from the jurisdiction of the British parliament; included under the ambit of The Charter of Rights and Freedoms – the Canadian Constitution’s newly enshrined bill of rights – was a clause that it be “interpreted in a manner consistent with the preservation and enhancement of the multicultural heritage of Canadians” (Canadian Charter of Rights and Freedoms, s 27 1982). And, in 1988, the Canadian Multiculturalism Act achieved royal assent thus creating the Department of Multiculturalism and formalizing the federal government’s duty to both recognize the diversity inherent in Canadian society and to take action to facilitate the full participation of ethnic minorities in Canadian public institutions.

In the late 1970s and during the 1980s, national governments in Australia, New Zealand, Sweden,

and the Netherlands implemented their own official multiculturalism policies. Each of these official multiculturalism policies was designed and implemented by a center-left government, and, to this day, multiculturalism remains a policy project that is inherently consistent with the goals and objectives of left-leaning ideologies, including the radical erosion of social hierarchies through democratic means and the institutionalization of equality of opportunity. The only notable exception to the connection between the political left and emergence of official multiculturalism took place in Canada when Brian Mulroney’s Conservative government passed the Canadian Multiculturalism Act in 1988. Nevertheless, this exception occurred well after the left of center Liberal governments of Pierre Elliott Trudeau entrenched the first two iterations of Canada’s official multiculturalism policy in 1971 and 1982 and, in so doing, also established the celebration of cultural diversity as a key feature of Canadian national identity.

To be clear, immigrant-receiving countries have implemented multiculturalism policies other than official multiculturalism in the aim of recognizing and accommodating immigrant cultural communities. Such policies include changes to national curricula in order to include greater representation of minority cultures, religions, and languages; the funding of transitional bilingual and mother tongue instruction; increased representation of minorities in public media programming; and affirmative action/positive action in public sector employment and in public universities. A recent empirical study conducted by Keith Banting and Will Kymlicka (2013) shows that, by the end of the first decade of the twenty-first century, a number of countries without official multiculturalism (such as Austria, Belgium, Germany, Norway, France, and Italy) had nonetheless implemented one or more multiculturalism policy.

### Criticism and Alternative Models of Immigrant Integration

Multiculturalism is not without its detractors. It has been criticized (1) for diluting national

identities and for threatening the persistence of national consciousness; (2) for essentializing minority cultures and for other potentially deleterious effects on minorities and minority cultural communities; (3) for obfuscating institutionalized racism and demobilizing anti-racist activists; (4) for stifling mobilization along class lines; (5) for protecting patriarchal minority cultures and thus preventing the realization of gender equality in minority cultural communities; and (6) for failing to integrate immigrants into the receiving society and for creating separate majority and minority cultural communities.

Criticism of multiculturalism sometimes translates into policy-making, as it has in the Netherlands and in Britain. In the Netherlands – in response to the apparent failure of Dutch official multiculturalism – successive national governments instituted, between 1998 and 2007, “civic integration” policies (i.e., the Civic Integration for Newcomers Act 1998, the Civic Integration Abroad Act 2006, and the Civic Integration for Newcomers Act 2007) that acknowledged demographic diversity but offered little in the way of cultural and linguistic accommodation for minorities on the path to integration. And, in a speech at a security conference held in Munich in 2011, David Cameron, the then Prime Minister of the United Kingdom, denounced “state multiculturalism” for creating parallel communities and for contributing to the rise of Islamic extremism in Britain and went on to declare that his government would practice a policy of “muscular liberalism” moving forward (Cameron 2011). According to one prominent observer (Joppke 2014), the Netherlands’ civic integrationist turn and the rise of “muscular liberalism” in Britain might be indications of a “retreat” from multiculturalism.

## An Uncertain Fate

Recent electoral developments suggest that multiculturalism – if it is not already in “retreat” – may have to persist in an increasingly inhospitable environment. In the last two decades, far-right political parties across Eastern and Western Europe (i.e., the Austrian Freedom Party, France’s

National Front, the Danish People’s Party, Greece’s Golden Dawn, and the Sweden Democrats) have made unprecedented inroads into mainstream politics. At the same time, social democratic and center-left political factions have steadily declined in power and influence, while some center-right political parties (i.e., the *Volkspartij voor Vrijheid en Democratie* in the Netherlands and the *Österreichische Volkspartei* in Austria) have adopted anti-immigrant positions more commonly associated with the far-right. Due to multiculturalism’s historical and ideological roots as a project of the political left, the rise of the political right at the dawn of the twenty-first century therefore not only threatens the survival of existing multiculturalism policies, it may also prevent the future attempts at recognizing and accommodating the diversity borne out of immigration.

## Music and Business Ethics

Timothy L. Fort  
Department of Business Law & Ethics, Kelley  
School of Business, Indiana University,  
Bloomington, IN, USA

### Introduction

The work on music and ethics looks at the ways in which emotions may be engaged by music in order to make optimal ethical decisions and also the ethical issues that arise in the use of music, for example, on politics or by businesses themselves. A primary driver has also been the connection between ethics and peace studies, and so much of the writing on music, business, and ethics also connect to peacebuilding.

### Music and Business Ethics

A relatively new effort to integrate music, business, and ethics with peace studies began in 2016. This collaborative effort was initiated by two conferences at Indiana University led by scholars at the Jacobs School of Music, the Kelley School of Business, and the College of Arts and Sciences. Music certainly stands to be a candidate for a cultural artifact that brings people together. It is not that we believe that we could find a single song that we all sing; it is the fact that we all do sing, and to broaden the concept, we all music and we know that musicking (Small 1998) touches emotions that can help to make us all instruments of peace. To push the metaphor further, the peacebuilding musicking provides more than just harmonizing.

Yet, it is even more than that too. Perhaps the most powerful tenet of the research into music and peacebuilding is the suggestion that music can contribute to empathy. It follows that empathy is required for compassion, and compassion is required for conflict resolution or peace. Music provides a language: it can be a unifying anthem of protest and of solidarity; it can be the rallying point for charitable acts that alleviate suffering. It can articulate, in ways, more powerful than words, the hopes, dreams, and fears of a community, nation, and world. The power and potential of music – and musicking – is enormous.

Such assertions, however, are loaded with ambiguities in at least two ways. One ambiguity lies in exactly how different nations might characterize a cultural artifact as being a shared heritage or something divisive. Any cultural artifact could be used for ill or for good. Music can be peaceful or violent. Sports can be welding or divisive. Religion can reach the most humanitarian aspects of love and justify the torture of an infidel. Business can bring people together to peacefully exchange good, and it can be exploitative. The difference between these kinds of uses lies in the normative aims.

To turn to normative thought may seem hopeless itself. How do we agree on what is moral and ethical? Yet, we do know something about what makes peaceful societies, and so by making peace itself an aim, we can move beyond endless philosophical speculations and instead look to the ways cultural artifacts – such as music – lead toward peacefulness rather than toward violence. It is with this dimension in mind that this special issue features the ways in which various cultural artifacts can lead toward peace. Without neglecting the ambivalence noted, what can music do to enhance peace or sports, business, religion, law, and film?

Readers of this encyclopedia will be familiar with business ethics. Kathleen Higgins provides a foundational understanding for the connection between music and ethics. Higgins, a professor of philosophy with a particular expertise in music and ethics, provides a philosophical methodology for disentangling the ambivalence of music. More specifically, she examines music's mechanisms

for creating solidarity, its risks in fostering enmities, and the use of music to build thriving relationships. Thus, drawing upon issues and concepts of relationality, she demonstrates models of how music can constructively nudge cultures toward peace or not (Higgins 2018).

More specifically with respect to Higgins' earlier work (Higgins 2011), she notes music's psychophysiological power that deeply impact not only our emotions but our very bones, thus orienting us to certain ways of thinking and behaving. She also describes music's metaphorical and symbolic capacities that help us understand tensions and their resolution, the notion of harmony, and the importance of listening, all of which can have application in ethical living.

Carolyn Calloway-Thomas studies intersections between empathy and conflict, and pedagogy and civil engagement. Calloway-Thomas has strong interests in the role of the arts in creating cultural connections and communication. Her article on empathy highlights the essential nature of communication and its powerful impact on relationships (Calloway-Thomas 2018).

Moving back toward the business side of things, in Timothy Fort and Todd Haugh's *Cultural Foundations of Peace: Sketching the Terrain, Business* (Fort and Haugh 2020), the authors set out a number of ways these three areas can interact. Included in this interaction is an understanding of the cognitive processes that are stimulated by both music and ethical business conduct, which may be similar and may reinforce each other. Because the authors argue that ethical conduct is related to peace itself, this reinforcement provides potential for music and business to constructively build on each other with results for peacebuilding itself. This intersection draws upon the ways in which both music and business depend on relationships in order to exist, the place of emotions in decision-making and musicking. They are also linked in their ubiquity and their ambivalence.

The authors provide a more in-depth assessment of the way ethical behavior connects with peace, and they then explore the ways in which music touches the emotions in ways that may be conducive toward nudging individuals toward

engaging in ethical behavior. Drawing on current thinking in behavioral ethics, they suggest that music may be able to play a proactive role in fostering ethical conduct in business. Drawing on the aforementioned, Higgins and Fort and Haugh describe how music can ethically impact human conduct in a naturalistic way as well as providing a narrative vehicle for ethical reflection. They also note music's ability to bring people together, literally in common song, that provides a sense of unity of common purpose.

In a response to musicologist Olivier Urbain (Urbain 2018), Fort also offers the example of an assignment from his business ethics class. Synthesizing several models of moral development, Fort then asks his students to identify a piece of music that corresponds to each level. Not only does this novel experience help students understand the levels of development, it also provides them with a musical touchstone to relate to during their career that may help them reorient whatever mind-set they might currently be in and a way to move to something different (Timothy Fort 2018).

There are additional, practical connections between music, business, and ethics. Jerry White, who earned his EMBA from the Ross School of Business at the University of Michigan and also shared in the 1998 Nobel Peace Prize, provides a commentary on how social movements are launched, grow, and become successful. Drawing on his own experiences in such movements, he weaves music themes throughout his message of how one might make music and business (and one could add other cultural artifacts such as film or sports) into agents of peacebuilding. Among his interesting insights is his view that in order to be successful, leaders must "come in from the right." That is, peace-related movements often find their homes and energy in left-leaning organizations and individuals. Yet, if one can find a way for more conservative individuals and organizations to see how a movement resonates with them, then one can be in a position to weld a non- or bipartisan movement that transcends contemporary politics (White 2018).

Cindy Schipani, Waterman Professor of Business Administration at the Ross School of Business, co-authoring with Kate Peterson (Schipani

and Peterson 2020) in *Recording Artists, Music, Social Change, and the Business World*, provides an analysis both in terms of how the lyrics associated with music can enhance cognitive awareness and movements toward peace and the business of music and the models for it to be constructively governed. More specifically, they remind us of the ways in which music has been used in social movements in the United States, ranging from the songs sung by slaves to Bob Dylan, John Lennon, and Bruce Springsteen. They also note its importance globally, including use of jazz as an international tool of cultural diplomacy and concerts such as Live Aid on behalf of the fight against AIDS. With this as background, they then address the business ways in which music is used, for example, to obtain charitable donations for a cause, such as Farm Aid, which in turn can have impact on legislation. The other side of the coin of music having an impact on government is the question of the censorship of musical expression either from the government itself, for example, with respect to lewd or violent lyrics, or within the music industry.

Finally, Joshua Perry and Arlen Langvardt, professors at the Kelley School of Business, look at a unique issue of the use of music and other cultural artifacts in political campaigns when such use is directly at odds with the issues of the artist. They introduce the topic by reciting some common appropriations of music in campaigns likely to resonate with the reader: Donald Trump's use of the works of Neil Young, Mick Jagger, Steven Tyler, Adele, and Queen as well as other disputes between Michelle Bachman and Tom Petty, Barack Obama and Sam & Dave, and John McCain and Jackson Browne. Drawing from legal (copyright and tort) law as well as from

ethical analysis, the authors assess the controversies associated with the appropriation of music that is contrary to the wishes and intents of the artist (Perry and Langvardt 2020).

## Narcissistic Leadership

Clive R. Boddy  
Tasmanian School of Business and Economics,  
University of Tasmania, Hobart, TAS, Australia

### Synonyms

Egotistical leadership; Machiavellian leadership;  
Psychopathic leadership; Toxic leadership

### Definition

Narcissistic leadership is understood as existing when the head of an organization or part of an organization is self-interested, self-admiring, self-absorbed, and self-prioritizing. In other words, the organizational chief puts their own needs, aims, and objectives before those of the organizations and followers they are supposed to be guiding and managing. Suboptimal organizational outcomes are associated with such leadership, because there may often be a lack of alignment with organizational objectives and the personal objectives of the leader.

Like the definition of a psychopath or a Machiavellian, the definition of a narcissistic leader is human-made and has changed over time. The common definition of a narcissist is anchored in the myth of Narcissus. However, a degree of conceptual drift has occurred. For example,

Falkenbach, Howe, and Falki report that extreme narcissism is psychopathic in nature and they have described pathological narcissism as being particularly related to violence and vengeance (Falkenbach et al. 2013). Similarly, Lubit's 2004 description of a narcissistic manager as being grandiose, arrogant, and lacking in empathy, remorse, and conscience and as people who are exploitative of others and disregarding the normal rules of society is very similar to common descriptions of workplace or corporate psychopaths. In line with the view that conceptual drift has occurred, some commentators on narcissism have commented that there are competing and contradictory definitions of narcissism (Rosenthal 2006). For example, for some researchers, narcissists are confident and realistic, while for others, they are unreliable and self-deceptive. Rosenthal suggests (2006) that because there is no "gold standard" criteria on which to base a definitive description of narcissism, such disputes are nearly impossible to settle. However, it can be argued that an examination of the myths of Narcissus can provide just such a gold standard. (See entry on "Narcissus" for this brief examination.)

### Discussion

#### Modern Conceptualizations of Narcissism

Some conceptualizations of narcissistic leadership or narcissistic behavior do correspond with

classical account of Narcissus, while others don't. For a review of what the elements of narcissism are from the literature, see especially Higgs (2009). Higgs paper mentions grandiosity, arrogance, exploitativeness, need for power, need for achievement, dominance, lack of empathy, and need for admiration as being among the elements of narcissism and narcissistic leadership. Current conceptualizations of narcissism in management research also find that as a personality, it is associated with a desire to be admired, deceptiveness, aggression, grandiosity, vulnerability, power-seeking, and dishonesty. Similarly, the American Psychiatric Association defined narcissism in 2014 as including grandiosity, fantasies of unlimited success, a need for admiration, an exploitative nature, a lack of empathy, and arrogance.

The traits, attitudes, and behavior accredited to narcissistic leaders but which nevertheless veer away from the descriptions of classical Narcissus include a desire to be liked by others, being aggressive, being exploitative, deceptive, bullying, grandiose, vulnerability to the perceptions of others, a need for power and prestige, and dishonesty. Similarly promiscuity involving short-term mating strategies and unrestricted sociosexuality is ascribed to the modern characterization of narcissism, but Narcissus himself, as a self-involved young adolescent, spurned all potential suitors and was probably a virgin.

Traits, behavior, and attitudes ascribed to narcissistic leaders and which do correspond with the classical Narcissus include a tendency toward derailment, striving for prestige, disagreeableness, a lack of empathy, failing to abide by the norms for polite social conduct, and unethical decision-making.

Excessive self-focus, attention seeking, exploitativeness in personal relationships, and extreme vanity are measured by the Narcissistic Personality Inventory (Jakobwitz and Egan 2005). Narcissists are reported to have grandiose, unstable self-concepts, an inflated sense of entitlement, and a tendency toward establishing superiority. They are reported to be arrogant and aggressive in terms of their personality (Alwin et al. 2006).

A need for prestige drives them, and they gravitate toward leadership positions after which their personality flaws help to create outcomes which are negative. People with high narcissism are reported to be arrogant, duplicitous, self-centered, and self-enhancing and also to have dominant personalities with a sense of superiority over others (Nathanson et al. 2006). However, the outward self-confidence, ambition for power, and ruthlessness of these narcissistic (and other toxic) managers can look attractive to employers, and this facilitates their rise up to the ranks of the powerful (Lubit 2002).

Potentially, narcissism, especially in its roots in classical-historical mythology, could arguably present the clearest difference between the three dark triad personalities. In its classical roots, it is a self-absorbed, passive, and coldly disengaged personality rather than being actively malevolent and manipulative. However, narcissism has drifted far from the classical myths of Narcissus, and modern characterizations are often Machiavellian and neo-psychopathic in nature.

## Narcissus

Clive R. Boddy  
Tasmanian School of Business and Economics,  
University of Tasmania, Hobart, TAS, Australia

### Definition

Narcissus is included in this encyclopedia because its derivative, Narcissism, has been associated with dark, selfish, self-promoting, and unethical behavior in the workplace and in leadership (see entry on ► [“Narcissistic Leadership”](#)).

There are several differing accounts of Narcissus in classical literature, but many descriptions are directly based on Ovid’s poem and Graves’s authoritative accounts (Hamilton 1993). Authors reports of passages from Ovid’s writing in Latin (in his book “*Metamorphoses*”) or of translations of the Latin e.g., (Hannan 1992; Tomkins 2011) can be referred to as these are close to the original surviving myths. Narcissus was the extraordinarily beautiful son of Kephissos (Cephissos), a river god, and Leiriope, a nymph. Narcissus was adored by others but only interested in himself (March 2008). Young men, and girls alike, fell in love with the beautiful 16-year-old Narcissus (pp. 510–513), but his adolescent heart was cold and proud and he scorned them all (March 2008).

Reports of earlier, Greek versions of the myth, suggest that one of the male suitors even committed suicide after being spurned by Narcissus. In Greek versions, Narcissus was brought up in Thespeia, in central Greece, and matured into an extremely handsome young man. However, Narcissus reportedly never discovered anyone else whom he considered to be as attractive as he

was, and he left a line of broken-hearted, male and female admirers behind him. One of these admirers was Ameinias, a young man who was repeatedly rejected by Narcissus and eventually killed himself with a sword that Narcissus gave him. Ameinias called on the gods, as he died, to take revenge on Narcissus.

Among those others who fell madly in love with him was Echo, a nymph (Holme 1981), who seeing him when he was out hunting, tried to embrace Narcissus and asked him to lie with her. Narcissus contemptuously spurned her, roughly shaking off her embrace and saying he’d rather die than give himself to Echo.

Echo was broken hearted and in despair, eventually wasted away until only her voice, itself only able to repeat the last few words of others, was left. In retribution for his coldness, Nemesis, hearing the story of Echo and Narcissus or Ameinias and Narcissus, fated Narcissus to experience unrequited love so that he may suffer the same fate as his rejected suitors (and perhaps gain some empathy).

Subsequently, 1 day, after hunting, Narcissus walked up to a cool, shining, undisturbed silver pool of water where he stopped to quench his thirst. However, when he saw his likeness in the silver water, he fell in love with the gorgeous reflection. Some versions report that Narcissus first thought that the reflection was a beautiful water-spirit and he tried to kiss its luscious lips in the lake but as he touched the water the reflection disappeared. At first Narcissus cannot understand why he cannot reach and touch the beautiful image he sees before him and which he desires.

Nonetheless, ignoring the real Echo – the nymph, Narcissus stayed there admiring what he eventually realized was his own visual echo, his reflection. Then unable to embrace or kiss the likeness in the water and therefore incapable of pulling himself away from his unrequited desire, he remained, until worn out by thirst, hunger, and his hopeless love (Ovid) he faded away and died. His body was not discovered but the narcissus flower grew at the spot he passed away and can still be found at lakesides and riversides. A narcissist was thereafter characterized as

someone who was emotionally immature and cold to others because they loved only themselves. Further, narcissists are deemed to love themselves too much for their own good.

In summary, the classical Narcissus was young and immature, an adolescent at the key stages of the myth. He was beautiful, self-absorbed to the point of being in-love with himself; proud, coldly, contemptuously, and passively indifferent to the affection and well-being of others. Although self-absorbed, he is not very self-aware, and at first, he does not recognize that the reflection he loves is his own and that he cannot embrace the image in the pond. He was also self-neglectful to the point of being ultimately self-destructive.

## Discussion

Comparing this classical description of Narcissus to the more recent characterizations of narcissism (see entry on ► [“Narcissistic Leadership”](#)) illuminates the degree of conceptual drift which has occurred in modern characterizations. The commonalities between classical Narcissus and modern narcissism are fewer than the dissimilarities, and a large degree of conceptual drift has occurred. For example, the original Narcissus displayed no grandiosity, rage, or desire to lead others. Similarly, the classical Narcissus was self-occupied to the point of self-destructiveness and this self-destructiveness is not reflected in modern measures of narcissism. Furthermore, Narcissism has been described as entailing pathological self-absorption, which fits with the classical Narcissus, but also with an inflated self-image and tendency to exploit others, which does not. The adolescent Narcissus did not exploit anyone, he only ignored them due to his pride and self-interest.

## Synonyms

Bystanders; Organizational ethics

## Introduction

Many types of unethical behavior persist in organizations despite the efforts of legislators, scholars, and responsible people in all occupations and professions. Not only is unethical behavior persistent, it is often an open secret, ignored, tacitly supported, and hidden from the public. It causes great harm to victims, organizations, and society. As such, an intriguing question is, “Why does unethical behavior persist when it is so damaging?” What is known about why unethical behavior occurs in organizations is outlined in the next section before the research question is explored.

## Why Unethical Behavior Occurs

For many years, researchers have attempted to understand the antecedents of unethical behavior

in work organizations. In the 1960s, researchers used surveys to identify and rank-order factors influencing unethical behavior: (1) behavior of superiors, (2) formal policy or lack thereof, (3) industry ethical climate, (4) behavior of one's peers, (5) society's moral climate, and (6) one's personal financial needs (Baumhart 1961). These factors formed the basis of models subsequently designed and tested to explain unethical behavior (e.g., Ferrell and Gresham 1985). Such models examined a variety of individual factors (e.g., age, experience, gender, moral philosophy, and locus of control) as well as organizational factors and situational factors (e.g., leadership, ethical climate, organizational culture, conduct of peers, stakeholder ranking, ethics management systems, and human resource practices).

Researchers also examined the roles of bystanders, people who know about unethical behavior yet do not try to intervene or help – behavior labelled “the bystander effect.” (See the seminal meta-analysis of bystander research by Fischer et al. 2011). The bystander effect was stronger in some situations: in hierarchical organizations, when information was widely known, when situations were ambiguous, and when some employees had high-quality relationships with managers (Hussain et al. 2019). There have been recent calls for research in workplace settings where bystanders are not strangers and when groups, such as human resource (HR) professionals, can act as “permanent bystanders” (Hussain et al. 2019; Parkes and Davis 2013).

## Theoretical Background

Recent conceptual articles (e.g., Zuber 2015) have proposed that two theories may be particularly helpful in addressing why unethical behavior persists: social network theory and behavioral ethics. Rather than focusing on unethical individuals – the bad apples – social network theory prompts researchers to focus on the relationships surrounding the perpetrators – their social networks. It posits that ongoing social relationships influence how individuals act in organizations (Granovetter

1978). Individuals' desires to develop and maintain social relationships often outweigh ethical considerations (Brass et al. 1998). Behavioral ethics posits that people make most decisions instinctively, rather than rationally, and it focuses on cognitive errors, social and organizational pressures, and situational factors that can undermine ethical decision making (Bazerman and Tenbrunsel 2011; Drumwright et al. 2015). It is especially helpful in explaining why people who believe they are acting ethically fail to do so.

## Networks of Complicity

Using social network theory and behavioral ethics as lenses, various types of persistent unethical behavior in diverse organizations and professions were studied (e.g., Cunningham et al. 2019). A primary finding was that perpetrators of unethical behavior built social networks around themselves that protected them and enabled them to continue their unethical behavior. These groups were labelled “networks of complicity” since they were composed of a group of people who were complicit in that they actively or passively supported the perpetrator. Networks of complicity are a primary and compelling explanation for the persistence of unethical behavior in organizations, and social network theory and behavioral ethics were pivotal to understanding them and explaining their impact on organizations.

Networks of complicity protected perpetrators in many ways. Some network members protected perpetrators proactively through actions such as making excuses for them, covering up their bad behavior, and undermining those who resisted or threatened to expose the bad behavior. Others were more passive in their support of the perpetrator and merely turned a blind eye to the bad behavior. How could members of the network do such things? Network members had succumbed to the behavioral ethics conditions of incrementalism and motivated blindness. Incrementalism is a cognitive bias that is often referred to as the “slippery slope,” and it occurs when people unconsciously lower their ethical standards over time, so they do not notice the change as minor ethical

infractions gradually give way to major ethical infractions (Drumwright et al. 2015). Motivated blindness is the tendency not to see the unethical behavior of others when it is not in one's best interests to do so (Bazerman and Tenbrunsel 2011). This moral blindness was supported by cognitive biases such as the in-group/out-group bias in which network members rationalized that other members of their in-group would not be capable of bad behavior. To acknowledge that a fellow in-group member would engage in unethical behavior would damage their favorable perceptions of their personal and professional relationships and ultimately of themselves. Given the evidence of the presence and negative impact of these networks, another question needed to be addressed, "How could such networks come about?"

Networks of complicity were built by perpetrators over time. Perpetrators were talented relationship builders who networked effectively inside and outside of their organizations. Their effective networking enabled them to assume a central position in the network that they created. Their network centrality provided them with network cognition, which refers to the ability to understand the network. Centrality and network cognition translate into increased power (Granovetter 1978). Perpetrators often had formal power from their organizational positions of authority as well as informal power derived from their network centrality and cognition.

Perpetrators drew people into their networks and secured their loyalty by providing them benefits – e.g., perks, bonuses, rewards, and promotions. Often the recipients did not merit these benefits, but they received them because they were willing to support the perpetrator. These rewards typically invoked the self-interest bias (Drumwright et al. 2015). The self-interest bias motivated network members to interpret information about the perpetrator and the unethical behavior in a way that benefitted themselves, and it kept them from seeing the unethical behavior for what it was.

Network members also justified their support of the perpetrator and their membership in the network as a result of the obedience to authority

bias and the conformity bias (Drumwright et al. 2015). The obedience to authority bias compels one to accept the unethical behavior of an authority figure, and as noted above, perpetrators typically had formal and informal power. The conformity bias prompted members of the network of complicity to conform to the unethical behavior of others in the network. This finding led to the next question, "How did perpetrators maintain their networks?"

Perpetrators used fear and their formal and informal power to intimidate, dominate, or exclude others, often using techniques such as verbal and physical intimidation. Victims and others who might expose the perpetrator were typically excluded, isolated, and marginalized.

Perpetrators were also masterful information manipulations, and their ability to control and shape information was increased by their central positions in their networks of complicity. Perpetrators maintained their networks by building myths about themselves to enhance and manipulate information about their importance, accomplishments, and abilities. For example, perpetrators would build myths about their indispensability to the organization even when they were incompetent. To decrease the chances that their unethical behavior would be detected and reported, perpetrators adeptly used the framing bias to their advantage. They framed information about their unethical behavior or the harm it caused in a way that camouflaged it. For example, one perpetrator framed the harm he caused as a necessary part of organizational change, and another framed his bad behavior as harmless humor. Perpetrators also would start rumors about their victims or others who resisted them, and they would disparage these people's accomplishments. In turn, network members spread the misinformation and myths. Perpetrators' network centrality combined with their ability to control and manipulate information typically succeeded in disguising their bad behavior. These findings raised a further question, "What are the effects of networks of complicity?"

Networks of complicity spread unethical behavior. The network property of contagion set in (Granovetter 1978); that is, attitudes, behaviors,

values, and norms spread rapidly through the network of complicity as members adopted some of the perpetrator's bad behavior. A vicious cycle was perpetuated. Protected by the network of complicity, perpetrators continued their persistent bad behavior, and others, given license to be uncivil, abuse authority and behave badly, joined them. As more and more employees witnessed managers' failures to address abuse and other unethical behaviors, it became less and less likely that such behavior would be reported or countered. As a result, the perpetrator and the network of complicity's became more and more entrenched. As unethical behavior increased and persisted, the culture of the organization became increasingly toxic.

The effects were devastating, not just for victims but also for other organizational members and for the organization as a whole. Victims typically experienced physical and psychological symptoms from the trauma they had experienced, and these symptoms were often severe. The perpetrator's unethical behavior, combined with favoritism in hiring and promotion, changed the power and decision-making structure of the organization. Trust in the organization broke down among the employees who remained outside the network of complicity. Without trust, cooperation and collaboration were often absent, and disillusionment was typically widespread. Often, the most talented people left the organization. Those who remained became less and less motivated to fulfill their roles in a high-quality fashion. Organizational performance declined, and innovation came to a halt.

It is important to note that unethical behavior persisted and spread despite formal policies against it. One might ask, "Where were the human resource professionals who create and enforce the policies?" Ironically, human resource professionals were often perceived as part of the problem – as active members of the network of complicity – or at least as permanent bystanders, who failed to speak up, step forward, and enforce the policies. This failure heightened distrust in the organization, and the negative spiral accelerated.

## Conclusions and Directors for Future Research

Social network theory and behavioral ethics are indeed helpful in understanding how and why networks of complicity develop and become entrenched, and why and how they enable unethical behavior to persist in organizations. They also can provide guidance regarding how to minimize the influence and the negative effects of networks of complicity. Perpetrators obviously must be removed, but because of the power the network has accrued, and the strong relationships among the members of the network of complicity, the network itself is likely to remain intact. If it remains intact, its counterproductive and unethical behavior is likely to continue. As such, leaders need to understand the social dynamics within their organizations, so that they can detect networks of complicity and work to erode the connections among members or disband the network and limit its power. For example, units and teams can be reorganized, and responsibilities can be reassigned to weaken formal ties and connections among the members of the network of complicity.

Leaders must work to increase transparency and have open discussions with employees about their concerns and the harm unethical behavior has caused. This is especially important since informal connections are harder to control than formal connections. Leaders need to make it clear through both words and actions that there are negative consequences for those who persist in their unethical actions or those who attempt to participate in a network of complicity. Rebuilding trust and changing an organization culture are among the most daunting tasks leaders will face. Thus, leaders must use all of the communication vehicles at their disposal to correct misinformation, dispel myths created by perpetrators and their supporters, and articulate a positive vision of how the organization can move successfully into the future.

Bystanders can and must play key roles in countering networks of complicity. Perpetrators and their networks cannot thrive without the passive support of bystanders who remain silent.

Bystanders can also be trained to detect networks of complicity, understand the devastating harm they create, and confront the bad behavior by speaking up. For example, training based on behavioral ethics research can help bystanders recognize the cognitive biases, social and organizational pressures, and situational factors that might prevent them from recognizing and coming to terms with the unethical behavior.

As noted above, victims are often isolated and pushed to the fringes of the organization by perpetrators and their networks of complicity. Victims must be connected and integrated into networks of support. Many victims feel reluctant to report unethical behavior, so organizations must provide them access to support services, such as counseling and confidential legal advice, without requiring them to make a formal report. When victims do make formal reports, ombudspersons must provide them with support and ensure that the investigation process is fair and confidential. Victims can benefit from mentoring programs that help them build relationships with others, especially those with influence and power.

HR departments and the professionals within them need to take the lead and demonstrate that they are committed to their roles as organizational ethical stewards who enforce policies and proactively follow-up on and address any indications of unethical behavior. Senior leaders must make sure that HR professionals are empowered and rewarded for fulfilling their ethical stewardship role rather than acting as bystanders.

Research questions associated with these findings abound. For example, achieving a deeper understanding of how perpetrators gain power, and the types of power they yield, would further the understanding of network of complicity formation and operation. Research to better explain the tools leaders use to detect networks of complicity early on and prevent them from fully forming and activating is needed. Studies, aimed at understanding how the negative effects of networks of complicity can be overcome once they form, are required. Such studies need to explore how the toxic organizational cultures created by networks of complicity can be reversed, so that

trust in the organization can be restored. Research needs to address how networks among victims and bystanders can be formed to counteract unethical behavior or used to support ethical behavior in positive ways. Much remains to be learned about networks and their effects on both ethical and unethical behavior in organizations.

## New Models of Finance

Steve D. Lydenberg  
Domini Social Investments, Providence, RI, USA

### Synonyms

Financial innovation; Financial theory; Future of finance

### Introduction

To cope with the complex, interrelated global challenges of the twenty-first century, finance will need to supplement its current focus on managing risk and reward at the investment portfolio and individual security levels with an understanding of its impacts on the environmental and societal systems within which it operates. The dominant investment paradigm today operates according to the principles of Modern Portfolio Theory – a theory of investment based on observations about the benefits of diversification, the connection between risk and reward, the efficiency of markets, and the usefulness of derivative securities. Increasing attention is now also being paid to such concepts as “impact investment,” which can be defined as “investments made with the intention of generating social and environment benefit along with financial returns”; and “triple bottom line investment,” which can be defined as

investments that “generate a return to people, planet, and profits.” This chapter examines the ways in which the latter two concepts are coming to complement the former and represent an evolution in the practice of contemporary finance.

## Evolution of Contemporary Finance

Best practice in investment today focuses on risks and rewards at the portfolio level but does not give equal weight to risks and rewards at the global systems level.<sup>1</sup> That is to say, it ignores investments’ relationship to the global environmental, societal, and financial frameworks within which they take place.

Best practice today is generally governed by the precepts of modern portfolio theory (MPT).<sup>2</sup> MPT focuses on portfolio-level risks and rewards, since the portfolio is its explicit domain. Just as modern portfolio theory represented an important step forward from the previous best practice of risk control in individual security-level selection, so does our understanding of investments’ implications now need to extend beyond portfolios’ bounds.

The management of risk at an individual stock or security level evolved in part as a result of two spectacular stock market crashes in 1720 – that of the Mississippi Company in France and the South Sea Company in Britain. To prevent such abuses in the future, Britain and the United States subsequently required legislative approval for the issuance of publicly traded stock until the late nineteenth century. In addition, until well into

<sup>1</sup>“Portfolio” here refers to the aggregate holdings of a single investor, the stocks, bonds, or other securities in which he or she may be invested at any given time. “Systems” here refers to basic infrastructures of environmental resources, social laws and customs, and financial rules and regulations within which investment are made and upon which investors (and corporations) depend for their ability to produce returns (and profits).

<sup>2</sup>The broad outlines for modern portfolio theory were elaborated between 1953 and 1972 and adopted by the financial community starting in the late 1970s. MPT’s investment disciplines now form the basis for institutional investment practice worldwide.

the twentieth century, financial fiduciaries were restricted to “legal lists” of high quality bonds and the occasional blue-chip stock.

This conservative, security-specific approach to investment worked well while investment opportunities were relatively limited, assets under management relatively small, and most investors relatively unsophisticated. The mid-twentieth century, however, saw an explosion of assets under management – especially by pension funds; the availability of new and diverse investment opportunities; the disclosure of relatively reliable financial information; advances in powerful information technologies; the development of academic theory about innovative investment techniques, particularly risk control; and the emergence of sophisticated institutional investors as the dominant players in the financial markets. As a result, simply assessing single-security risks and rewards was no longer an investment approach adequate to the times.

The next step in the evolution of finance was the management of investments with an eye to the overall risks and rewards of entire portfolios. Elaborated from 1953 through 1972 and put into practice starting in the late 1970s, modern portfolio theory (MPT) was a true revolution in finance. It supplemented the practice of simply avoiding individually risky securities with sophisticated disciplines for managing portfolios as a whole, adopting axioms such as the benefits of diversification, the efficiency of markets, and the correspondence of risks taken and rewards received.

MPT assumes that systematic risks – that is, those inherent in the market or in an asset class (such as stocks or bonds) as a whole – are beyond the ability of investment professionals to influence or control. Money managers therefore should not be penalized, or given credit, for portfolio losses or gains due to the “systematic” rewards or risks of the markets, but only for their own “idiosyncratic” contributions to their portfolios’ performance, positive or negative, relative to that market. The assumption that portfolio decision-making can be treated as independent and disconnected from the markets within which these decisions take place – and by implication, from the world at large – may have been appropriate when

finance was a less powerful tool than it is today and when few investors had adopted the tenets of MPT. As institutional investors throughout the world have come to accept and implement MPT in practice, however, it has become increasingly reasonable to raise questions about their impacts at systems levels.

## Limitations of Modern Portfolio Theory

The benefits of MPT are clear. Rewards at a portfolio level can be increased through diversification in security selection and asset allocation without increasing overall portfolio risk. Risk can be measured by calculating the volatility of securities relative to the market and an adequate level of return calculated for that risk taken. Derivative securities such as options, futures, and swaps can be adequately priced and used to reduce portfolio transaction costs. And inefficient markets where securities are mispriced can be exploited through superior data collection and analysis.

Over the years, to address some of MPT’s shortcomings, academics have proposed incremental modifications including the arbitrage pricing theory, the adaptive market hypothesis, and the discipline of behavioral economics with its observation that those participating in financial markets do not always act in their own best interests.

Although these elaborations did not call into question the basic advances that MPT represented, the unqualified faith in MPT was shaken by the global financial crisis of 2008. How could highly sophisticated, highly compensated, highly educated investors running the largest financial institutions in the world create a situation that resulted in the collapse of Lehman Brothers, the rescue of Merrill Lynch from bankruptcy, and a US government takeover of General Motors, American International Group, Fannie Mae, and Freddie Mac? How could such disastrous mistakes have been made?

In the spirited debate that followed, pundits identified various factors that had contributed to this systemic crisis. Legislators and regulators put

a number of technical reforms in place with incremental fixes. Others called for a more fundamental reevaluation of MPT in part because the crisis suggested that its precepts may have undermined the stability of the financial markets. One line of thinking was relatively straightforward: restore judgment to the investment process. MPT's reliance on sophisticated mathematical models had substituted for judgment in the investment process to a large extent. "The problem on Wall Street at the end of the housing bubble is that all judgment was cast aside. The math alone was never going to be enough," as the *New York Times* columnist Joe Nocera observed in a 2009 article (Nocera 2009).

By eliminating individual, case-by-case judgment, MPT took the human element out of finance and left managers open to the vagaries of poor data inputs (e.g., incompetent credit rating analyses), cons and fraud (e.g., Bernard Madoff), and imprudent lending practices (e.g., the "robosigning" of mortgage documents). In addition, when institutional investors all used similar mathematical modeling techniques they made similar investment decisions that created "herding" effects in the marketplace.

Although the idea of returning to good old-fashioned finance has its appeals, one cannot simply turn back the clock to a by-gone era. The "legal lists" that limited financial fiduciaries' investments to the highest-rated bonds and stocks are clearly impractical and unwise today. Nevertheless, there remains an uncomfortable sense that the overly mechanistic approaches of MPT need modification.

## Systemic Frameworks

As the world of the twenty-first century continues to evolve, institutional investors are increasingly asking whether as a group they impact, positively or negatively, the financial, environmental and societal systems within which they operate. That the question of impact is arising now should not come as a surprise. The absolute amount of assets controlled by the financial services industry has grown to an almost inconceivable size, totaling an estimated \$250 trillion as of 2014. This endows

the financial services industry with an enormous potential influence. The fate of the chemical composition of the Earth's atmosphere and oceans and the durability of arable soil globally, for example, lies largely in the hands of industry and its financial backers. Conversely, these same institutions can direct their considerable assets toward providing the two billion persons at the bottom of the global economic pyramid with access to financial services, information technology, health care and consumer products that would not only enhance their quality of life but also generate a broad range of new investment opportunities.

The next logical step in investment practice in an increasingly populous world, globally connected by telecommunications and transportation, and aspiring to ever-higher standards of living, is therefore understanding the systems-level impacts of investment decision-making, along with their risks and reward characteristics at portfolio levels. It is not only the 2008 financial crisis and ongoing concerns about the stability of the financial systems that is driving investors to look to their role in systems-level risk management, but the potential for systems-level disruption from such complex environmental challenges as global warming and ozone depletion and the challenges to societal stability from such developments as increased inequality, global youth unemployment, and patterns of migration.

Crucial to understanding how these potential risks and rewards can be managed will be a set of metrics for measuring environmental, social, and governance (ESG) factors at both the narrow portfolio and at broader systems levels. Substantial progress is being made in parallel efforts at both levels today, but little work is being done to document and understand the feedback loops between the two. Among the progress made in the development of tools that help in the incorporation of ESG factors into portfolio-level management are methods for:

- Measurement of the ESG performance of companies relative to their peers
- Measurements of the ESG performance of companies relative to absolute standards or scores

- Measurement of company progress toward specific ESG goals

These measurements can be used to assess the overall effectiveness of a portfolio of companies in addressing a specific challenge.

At the same time, an analogous set of measurements has been developed to assess the strength and resiliency of the broader environmental, societal, and financial systems themselves. These include:

- Measurement of progress in various alternatives to gross domestic product (GDP)
- Measurement of progress in human, development, poverty alleviation, and preservation of natural capital, such as those implied in attaining the United Nations Sustainable Development Goals
- Measurement of the stability of the financial system, such as those implied in stress tests for large banks

In both exercises, valuation of nonfinancial assets or capitals is challenging, with economic and accounting flows often serving as a convenient tool for value measurement; relevant non-economic or accounting data being difficult to define and gather; and the incorporation of this additional data tending to complicate comparability.

Little work has been done to date to bridge the gap between these two parallel areas of research. Still unanswered are questions such as: What is the relationship between the standards and goals set by investors at portfolio levels and the general indicators of progress at systems levels? In what ways and to what extent does the management of portfolio-level risks and rewards translate into systems-level impacts? In what ways and to what extent do system-level developments affect portfolio-level performance?

Answering these questions and developing tools that can bridge this gap and understanding the feedback loops between the two sets of systems will be key to the future of finance in the twenty-first century. If we are to make progress in

this direction, asset owners and managers will need to:

- Acknowledge the connections between investment decision-making and risks and rewards at a systems level
- Understand the feedback loops and information flows between their total portfolio policies and practices and the systems-level issues with which they are primarily concerned
- Construct portfolios and engage with issuers, industry standard setting organizations, and nongovernmental institutions in ways that minimize risks and maximize rewards at systems-level frameworks
- Collaborate with governmental agencies to align public policy with the preservation and enhancement of valuable systems
- Communicate publicly their commitments to the management of systemic risks and rewards and how these commitments manifest themselves in their investment practices and policies

## Conclusion

We cannot go back to only measuring security-level risks and rewards, nor are portfolio-level considerations alone sufficient to cope with the challenges of the twenty-first century. Finance must move forward while embracing intelligently and responsibly all three considerations of the risks and rewards to securities, portfolios, and systems. Sophisticated financial systems have been tried and tested over centuries; elaborate societal norms and standards have evolved over millennia; and rich, stable and resilient ecologies and natural resources have taken eons to create. These are among the key components upon which investments depend for current and future rewards and are well worth preserving and enhancing. Without an awareness of the impacts that investment decision-making has on these systems we run the danger of undermining our prospects for long-term prosperity. It is only with a keen perception of how investments can produce positive impacts beyond the narrow confines of the

portfolio that we will be able to act intentionally to assure that finance helps create the stable and resilient world necessary for successful investments and a prosperous society in the coming century.

## Normative Ethics

Andrew B. Gustafson  
Creighton University, Omaha, NE, USA

## Synonyms

Moral philosophy; Moral principles; Rules of conduct

## Introduction

Ethics are the principles guiding one's moral behavior. Ethics is also the study of these principles – namely, what is good, and which actions are right or wrong. Normative ethics is concerned with what people ideally ought to do (Kagan 1997). Typically it is thought that people ought to do the right thing, and ought not to do the wrong thing. People should be good, not bad. People ought (or ought not) to do certain things and when such claims are made, they set forth norms of behavior – the way things ought to be. Ethical behavior is not always common, and

this is why it is frequently said that it is difficult to do the right thing. Normative ethics also play an important role in providing moral justification for one's own behavior. One may ask, “why did you make this decision?” and what is being asked is “what is your moral justification for doing this? – why did you think this was the right thing to do?” and in asking this, one is asking them to provide a moral justification for their action. The goal is to know which normative ethical principles were underlying their deciding to do this instead of something else. If they say “I was just tired” that is not a moral reason (although it is a reason of sorts). A moral reason is what is sought – and it is best to see a moral reason which can demonstrate that they did what someone did makes sense in terms of an understandable normative ethic, so one can see why they thought they ought to have done what they did. So this is what normative ethics tries to discover – how one ought to live, behave, and act in the world.

First, consideration will be given to some of the typical ways by which normative ethics are frequently established, but first, to help clarify what normative ethics is, one should be clear about what is not normative ethics.

## What Normative Ethics Is Not

*Descriptive Ethics:* There are studies of behavior – ethical behavior – which tell us *what people do*, or tend to do. Such studies are not normative, but rather descriptive. Of course one can describe what sorts of principles guide someone's behavior, for example “Sally is always selfish” or “it's hard for John to tell the truth – he is a natural liar” and in those cases again one is providing descriptions of people's ethics. This is descriptive ethics. Descriptive ethics tells us how people do behave (what is the case), but not how they ought to behave (what ought to be). Traditionally, the study of ethics is normative – meaning that one is trying to discover how one ought to behave, not how people actually are behaving. This is why it is often said that it is hard to be ethical – to do the right thing – because frequently people do not act ethically. Those familiar with the saying “you

need to walk the talk” already understand the difference between the way people say one should behave and the way that they do in fact behave. So normative ethics will be principles helping us to know the good life to be and the right way to act.

*Behavioral ethics/Moral psychology:* There are also studies of ethical behavior which examine *why people do what they do*, and why they make the ethical or unethical decisions which they do. While ethics would pursue the question of why they ought to or ought not to have done such a thing, moral psychology or behavioral studies simply want to know why (from a non-moral perspective) people act in those ways. Psychological empirical studies pursue the psychological *why* to why the person acted as they did, but not the ethical *why*. Such studies may be quite helpful in understanding people’s moral blind spots, for example, pointing out how people rationalize particular sorts of bad behavior for example. Such studies may also help us understand how to help encourage moral behaviors through particular institutional policies or programs. For example, it may be shown that workers who work in an environment which has a lemon scent are actually shown to act more ethically, or that people tend to make more moral misjudgments when they are not well rested or under stress. These are all interesting facts to consider, and while it is very important to understand physiological factors affecting why people do what they do – particularly if you want to manage them and get them to act in certain ways – such studies are not normative because they are not trying to understand what *ought* to be done, but rather, *why people do what they do*.

*Legal rules:* It is common for people to justify their behavior as being moral because it does not break any laws, and this applies to business practice as well. For example, when accused of immoral behavior, people will often defend themselves by pointing out that they did nothing illegal. Very frequently, corporate “ethics policies” appear to be nothing more than *whatever the law will let them get away with*. But there are two problems with using the law to determine normative ethics. First, many laws are not oriented toward ethical practices, and so provide no

moral guidance. Many laws simply provide policy requirements to provide conformity and consistency in civil, business, or other activities. Wills must be written in a certain way, particular documents must be signed and sealed by a notary, marriages must be documented in a particular standard manner, and so on. Such procedural requirements, while codified into law, are not ethical requirements. For example, people frequently make handshake agreements without writing things down in a legal contract, and such handshake agreements are often not legally enforceable, because they are based only on a promise – and ethical commitment. But the people who make such handshake agreements frequently say “my word is my bond” and if the two people making the agreement trust each other, then the agreement still is morally binding, although not in a court of law.

A second problem with using the law to determine normative ethics is that frequently the laws people pass are trying to catch up with ethics, and there are many behaviors which may not be ethical, which are not restricted by law, at least yet. A society should not want laws for all ethical behavior in fact. It would be a very strange world where society had laws requiring that children do not speak disrespectfully to their parents, where society made it a legal requirement that one be kind to others, or to think of others before yourself. Of course many laws are established to legally prohibit behavior which society determined to be morally wrong (whether effectual or not, this is the intent of Sarbanes-Oxley act, and laws prohibiting collusion, extortion, bribery, or monopolistic practices). But the law is sometimes challenged on the basis that it is unjust, or unethical. For example, the US has had many laws which were later determined to be unethical and so changed (i.e., Jim Crowe and other segregationist laws, prohibition of women or the landless from voting). Finally, the law often lags behind in providing laws for right behavior in certain areas. There is such lag-time in rapidly developing fields such as bio-engineering, artificial intelligence, and big data use, areas which have evolved so quickly that it has been difficult for legislators and regulators to establish

thoughtful useful policy to give directions for compliant behaviors.

## Types of Normative Ethics

Normative ethics is an attempt to systematically provide a coherent set of rules or aims for behavior, including for professional fields, such as medicine or business (Smith 2008). What are the ideal ways people think people ought to behave? What are the values which people believe should guide and direct us in our activities? What kinds of behavior are to be encouraged, and which are unacceptable behaviors? The study of normative ethics supports these aims systematically by providing reasons for how one should act, and why one should behave this way instead of some other way. Most of these systems have particular starting points. One could say that there are different starting points, or first principles for ethical reasoning.

### Authority-Based Ethics

*Divine Command Theory:* One traditional view of ethics is that it is based on the divine decrees of God. On this view, what is right and good is whatever God says is right and good. The difficulty is, of course, determining what it is that God has decided.

*Theological Ethics:* Also called moral theology, theological ethics provides answers for how one ought to act by deriving it from theological truths of scripture and church teachings. This approach helps believers to determine what they should do in a particular instance.

*Faith or Upbringing:* A less philosophical but very common basis for determining norms for moral behavior is from your parents or family, for example, or your religion. Many of us have strong convictions about what is right or wrong from authorities which helped instill those beliefs in us – our family or our faith. Religions have guiding rules for personal conduct, and provide ideals for how life should be lived. If one is a member of a particular religion, you strive to live out your religious ideals in practice. For example, if I am a Christian, my faith will provide

some guides of what is right and wrong behavior for me. The teachings of Jesus Christ and the Bible and the Church will provide helpful guidance for my personal behavior as well as my civil and public behavior – including my business practices. Once one is a believer, the belief system provides the outcomes and reasons for right actions. But this basis for having norms of behavior is limited, because when one has encounters with people who are outside of our faith or our family norms, one may have difficulty finding common ground. For example, if I am a corporate executive of a public company, it will not work to establish all of the corporate ethics policies simply on the basis of “what my mom always said” or “these are the teachings of Mohamed” or “this is what the Bible says,” etc. For public ethical norms, I need to have some other common basis of deciding right and wrong, since not everyone shares our family or faith norms of behavior.

### Reason-Based Ethics

In the public sphere, and in the realm of business, normative ethics is more often derived from non-religious sources, especially in western cultures. Because not all of the people involved in business transactions in the public sphere have the same religious beliefs or convictions, normative ethics is usually based on reasons which do not require adherence to a particular religion. These norms are usually thought to be discovered through reason – so that anyone with properly functioning reasoning abilities will see the reasoning and potentially agree with the norms.

Even if there is not always agreement, when normative ethics is grounded in reasons which are generally accessible to everybody, there is at least opportunity for everyone to join in the discussion and possibly come to agreement with others. There are a variety of ways to try to derive ethical norms. The field of normative ethics might be divided according to the various ways of conceiving of and justification of what is right and wrong behavior. Here consideration will be given to a few of the more common systems of normative ethics.

One important distinction is between consequentialist and non-consequentialist norms

(Gustafson 2018). Those who determine what is right or wrong according to consequences are consequentialists. For example, you may think that an action is right or wrong depending on whether or not it brings about the greatest happiness overall. Non-Consequentialists derive ethics from ideals or formal principles, not from consequences.

*Egoism* is the view that the right action is whatever will benefit me personally the most. An advantage of egoism is that it is one of the most simple of normative ethical theories, because it has only one consideration – what benefits oneself. But egoism has great difficulty accounting for many of our traditional moral intuitions. It seems that ethics usually require us to make sacrifices for others, or at least consider the interests of others – and that I have certain duties I should perform. Egoism has little place for such concerns. Yet it seems that frequently we find our moral conscience is asking us to give up our own satisfaction. I may want a third piece of chocolate cake, but my moral conscience speaks up saying “you’ve already had two and some have had none – you must let others get some and not be a pig” but for an egoist, such a concern for others would be nonsensical, and so it seems egoism does not capture many of our common ways of thinking about ethics.

*Social Contract Theory* (contractarianism or contract theory) arrives at ethical norms through discussion and agreement (Donaldson and Dunfee 1999). The legitimacy of ethical principles is rooted in demonstrating that the principles are those which would be agreed to by objective actors in a fair and impartial decision procedure (Rawls 1971).

*Utilitarianism*, rather than considering the interest of just myself, is concerned with the greatest happiness overall. Basing ethics on the consequences of actions, Utilitarianism is the view that one can determine which actions are right which ones are wrong on the basis of whether those actions will bring about more or less happiness overall (Gustafson 2013). Actions which bring about more happiness will be the right ones, and actions which bring about less happiness or unhappiness would be the wrong

ones. Utilitarianism may require me to make sacrifices and give up some of my happiness for the greater happiness overall. It also is primarily empirically based on outcomes – the right act is the one which has the best outcome of greatest happiness. A key difficulty is trying to determine or calculate the greatest happiness (Eggleston and Miller 2014).

*Deontological Ethics*, sometimes called duty or rule-based ethics, is the view that ethics is not determined by consequences, but rather by a formal criterion. What makes an action right or wrong is due to its being in line with particular rules (Guyer 1992). For example, Kant said that one can determine which actions are right and which ones are wrong by asking ourselves the question “could I make this into a universal rule?” He also believes the rules one follows must consider people as ends in themselves, not as a means to an end. All individuals have dignity, and that should not be traded as a means for some other end (Arnold and Harris 2012).

*Virtue Ethics*, traditionally conceived, is concerned primarily with what sort of person I should be – and what kind of positive character traits (or virtues) I should develop in myself through habit (Crisp and Slote 1997). Of course there are actions I should practice to become a virtuous person, but the goal is to be virtuous. Its normative focus is on proper character traits, not merely right action in a given instance (Hartman 2015).

*Natural Law*: This is the view that one can discover the rules of what people ought to do by rationally examining our inclinations. For example, from my inclination to try to not get killed (by falling pianos, etc.) one can derive that life is good and one should preserve it (our own and others). Natural law is thought to be available to anyone with a properly functioning mind and inclinations.

*Intuitionism* is the view that basic ethical truths are self-evident, and then one must reason from those to make ethical decisions. Your intuition gives you the fundamental ethical principles (i.e., do not lie) and then reason helps us to determine how to choose what to do in a given circumstance.

*Pragmatic Ethics* consider the discovery of ethical principles as akin to scientific inquiry – ethical norms and principles, like science, are able to be improved upon through discovery, and they may change over time due to societal evolution, which is why the inquiry is ongoing (Rosenthal and Buchholz 2000).

*Market Failures Approach* or Ethics of Competition: More recently, some have attempted to develop a market failures approach to provide normative business ethics by reference to the basic rules of the market itself (Heath 2014). For the market failures approach, norms will come from regulation, but beyond that, individuals and companies need to follow ethical imperatives, which avoid market failures that arise from negative externalities, information asymmetries, barriers to entry, opportunistic behavior, and other activities which undermine the markets proper functioning.

What all of these theories of ethics share in common is a belief that there are norms of behavior which one ought to follow or live by, and that it is possible for us to discover them. Despite the fact that there are so many differing starting points or reasons given for deciding what is right or wrong, in fact there is often a great deal of agreement about the norms of ethics, even from different theoretical perspectives.

## Notion of Personhood from a Spiritual Perspective

José Ignacio Murillo<sup>1,2</sup> and Gonzalo Alonso-Bastarreche<sup>1,3</sup>

<sup>1</sup>University of Navarra, Institute for Culture and Society (ICS), Mind-Brain Group, Pamplona, Spain

<sup>2</sup>University of Navarra, Department of Philosophy, Pamplona, Spain

<sup>3</sup>University of Navarra, School of Education and Psychology, Pamplona, Spain

## Introduction

The concepts of *personhood* and *spirit* are quite usual in business and professions. However, the use of both terms is not univocal. Some authors even question such concepts because they are not easily measurable (Alzheimer-Europe 2013), while others do not accept that they can refer to any reality. Facing these difficulties, this entry

will methodologically assume that *personhood* must not be confused with neither *person* nor *personality*. *Person* refers to the concrete human individual, and *personality* refers commonly to the convergence of his or her psychological and moral individual characteristics. But *personhood* refers to something more basic and profound: the necessary condition that enables a person to be considered as such.

The approach that will be developed here is not empirical and claims that the human individual has a spiritual dimension beyond the body, but complementary with it. It has been said that reductionism is perhaps the most complex topic that any theory about the person must address (Garrett 1998, 320), and the same can be said for personhood. Considering personhood from a transempirical perspective, two principal kinds of reductionisms rise up: firstly, those theories that understand personhood as a result of some mental or cerebral processes and, secondly, more generally and deeply, those which consider personhood as an abstract or general quality. This would critically contravene the reality and irreducibility of personhood (Spaemann 2006, 68; Raeff 2017, 8–9; Mascolo 2017). On the contrary, “personhood” refers to a dimension of human being that is not a mere object, that is, a thing or some quality of a thing, and cannot be reduced to anyone else, that is, that personhood is neither the brain of the person nor her intelligence, nor her feelings, nor a result of her behavior. The spiritual perspective starts from a gnoseological point of view that avoids the misunderstanding of any possible objectification of the sphere of the person (Frings 1996, 99).

We will begin by analyzing the notions of spirit and personhood before dealing with the topic of this entry.

## Notion of Spirit

The first difficulty that faces an approach to the notion of *spirit* is the polysemy of the term. This term admits a religious approach but here will be treated from a philosophical perspective, taking also into account the importance of that notion for

some religions. The second difficulty is the reductionist approach to the notion of spirit, which considers it not as a genuine entity, but because of previous conditions or entities, such as the body or the brain. A historical review of its use could be helpful in order to lead us to a precise notion of spirit (Swinburne 1998; García Cuadrado 2010; Ferrater Mora 1994).

The etymological origin of “spirit” is the Latin term “spiritus,” which translates the Greek term “*pneuma*.” In ancient Greek philosophy, this term is closely linked to the term “soul.” The soul is the principle that enlivens living beings and is responsible for its activity. In ancient medicine “*pneuma*” was also applied to certain rhythmic movements proper to living beings like the beat of the heart. Our current concept of spirit finds its homologue in classical philosophy in the term *nous* (Ferrater Mora 1994), which is translated as “mind,” “intellectus” (Latin), or “Geist” (German). In late Greek thought, “*pneuma*” will acquire the meaning of the supreme dimension of the soul, endowed with immateriality and immortality.

For the first time in Greek philosophy, Plato proposes a clear distinction between the realm of the spirit (the “*nous*”) and that of the senses. For him, it is the intellect and not the senses that reaches true reality, while the senses attain only the corporeal reality which is a shade of the intelligible world, and so a derivative and inferior reality and only completely intelligible in relation to ideas. This conception produces a dualistic anthropology where the human being is divided into a spiritual part, the soul, which can contemplate the ideal world, and the body, which is only temporarily attached to the soul, more as a burden than as a sort of perfection. Some later platonic philosopher will see the union of the body to the soul, at most, as an instrument of the soul during the time they both are united.

Christian thought developed the sense of the term in continuity with later ancient Greek philosophy and Hebraic thought. This way, the supreme spiritual being would be God, and men are spiritual in the measure they are endowed with rationality and free will. In contrast with the ancient view, as expressed by Plato and

Neoplatonism, now the body is neither an instrument nor any kind of burden. Spirituality and corporality are not separated or opposed, but complementary dimensions of the description of human beings. In this line, Aquinas, rooted in Aristotelian anthropology, strongly defends the unity of the person.

In contrast to Aquinas, Descartes considered body and soul as two distinct kinds of substances and so introduces an opposition between both realities: the body is *res extensa* (a thing with extension), whereas the soul or spirit is *res cogitans* (a thinking thing). He not only separates both dimensions but also identifies the spirit with its conscious activity. After Descartes, Kant does not reject this dualism, although he does not substantialize the objective and the subjective side of human experience. Hegel tries to go beyond the finiteness and limitation of the intellectual knowledge in Kant and comes to the apex of the idealism: he considers the spirit, in the last and absolute moment of its development, as an impersonal reality where subjectivity and objectivity are definitely unified. Post-Hegelian philosophers are strongly influenced by this thought. Some of them reject the characterization of the Absolute as spirit and claim it is nothing but matter, while others try to overtake the impersonal character of the spirit: they think that human individuality must recuperate its well-deserved preponderance. In this line stand out Kierkegaard, the personalists, Neo-Aristotelians, and the neo-Scholastic thinkers of the twentieth century. The impossibility of reducing the spiritual dimensions of human being to the methodology of natural sciences finds an influential expression in Dilthey's distinction between two scientific methodologies: natural sciences *explain* the sphere of nature in terms of causes and effects, while the sphere of the spirit must be *understood* attending to the meaning that human productions entail (Dilthey 1989).

For any of the most widely held religions throughout the world, including those of ancient Asia and the three great monotheistic faiths, the human being is composed by a spiritual element (the soul) not reducible to mere matter. This element is considered the basis of freedom,

responsibility, and moral behavior and of the inherent openness of the person to transcendence (Melé and González Cantón 2014, 68–74). These approaches see the spirit as a genuine dimension of the human being, sufficiently distinct from others such as the biological and the psychological, and irreducible to matter.

Finally, it must be considered that *spirit* is not the same as *spirituality*, which is the expression of human longing to approach a supreme entity or power situated beyond human control and grasp (Gross 2006, 425).

## Notion of Personhood

The understanding of the notion of personhood requires an explanation of other notions that are in connection to it. When we try to speak about *personhood*, sooner or later, some key concepts appear that must be highlighted.

*Singularity.* The term *personhood* is related to the singularity of every human being, while another term, *human nature* (or *humanity*), refers to what is common to any of him or her. Why not to use only the term “individuality?” The use of the term “personhood” implies that the singular being it refers to is beyond the simple individuality understood as a case of a species: each person is absolutely unique, that is, not interchangeable (Melé and González Cantón 2014, 94–95; Naughton 2015, 183–184; Spaemann 2006, 236–248).

*Subjectivity.* The special singularity of the human being lies in what can be called subjectivity: the singular human being has a rich inner life, a realm constituted by emotions, perceptions, thoughts, memories, and a personal worldview (Polo 2016a, 23; Melé and González Cantón 2014, 94). The existence of this realm is almost a trivial evidence (broadly speaking there is a certain kind of subjectivity also in some animal species). What is relevant to the notion of personhood is if subjectivity can take control over the individual behavior and development. Personhood as a special subjectivity is directly related to this possibility (Mascolo 2017; García González 2014, 204–206).

*Identity.* Personhood is closely connected with the unity and continuity of subjectivity over time. From a psychological point of view, this feature presupposes memory but does not depend totally on it. Personhood is connected to the living body through which it exists and manifests itself, and this makes also possible the identification of the person through time for her and also for others (Spaemann; Güell et al. 2017). The concept of identity is the key concept to understand the psychological and biological approaches to personhood.

*Self-possession.* The priority of the domain that has been mentioned above, if given, is usually called self-possession. This aspect is opposed to the external causation and therefore related to a strong concept of freedom (O'Connor 2016; Melé and González Cantón 2014, 94, 159–162). With the concept of freedom as the ultimate origination of action are linked the concepts of *indeterminacy*, *choice*, and *self-determination*. Self-determination implies the possibility of distinguishing between first- and second-order desires, that is, those desires related to other desires, which allow establishing an order among desires (Frankfurt 1971). This possibility is rooted in choice, understood as the capacity of acting on the basis of a certain global representation of one's life (Vigo 2016, 180). However, to properly understand this notion, it is important to clearly distinguish between the mere capacity of self-determination and its development or achievement. This capacity is related to the dynamic character of personhood, which must be considered the ultimate center of acts (Scheler 1985, 387–389; Polo 2016a). On the other hand, the development of this capacity constitutes the maturation process, the shaping of the moral character, the emotional integration, etc. (Melé and González Cantón 2014, 171–177; Polo 2016b, 22).

*Intimacy.* Close to the above explained notions of *subjectivity* and *singularity*, this key concept gathers together the interior and unique (unrepeatable) characteristics of personal *subjectivity* (Polo 2016a), which can share his intimacy if she/he wants.

*Intersubjectivity or relationship.* As human persons can share his/her intimacy, *personhood* appears related to *intersubjectivity*. Many researchers consider that the most important feature of *personhood* is *intersubjectivity* (Mascolo 2017; Polo 2016a; Alzheimer-Europe 2013). This means briefly that *personhood* enables to establish some kind of relation with other persons (Martin Buber). It has even been said that “the person is not limited to being: she is *co-being*, co-existing, being-with” (Esclanda and Sellés 2016, 31).

These notions, when considered only as psychological achievements, can carry to an *operability-based approach to personhood*. This approach considers *personhood* as a property that appears as a result of some acts: someone would be person if and when (and while) he develops at some point a certain number of those capacities, either the self-possession or the capacity to perceive oneself as existing over time or the intersubjective relationships. On the other hand, there is the possibility of considering all those notions as ontological traits, where we come to an *inherent approach to personhood*: every human being is a person to the extent that is a human being (Polo 2016a; Melé and González Cantón 2014, 91–109; Spaemann 2006). The first approach relies on a previous objectification. Firstly it excludes from personhood the subject that is underneath, and, secondly, it considers *personhood* as a label that must be achieved (and can even be lost).

## The Spiritual Dimension of Personhood

Personhood, as the singularity of the human being, claims to be considered the key to or hinge of anthropology and ethics. In order to achieve an inherent approach to personhood, that is, a non-reductionist and non-objectifying approach to personhood, it is necessary to develop a spiritual perspective. Only through accepting a spiritual dimension of the human being, we can consider the notions explained above as ontological non-emergent traits excluding, at the same time, an alleged opposition to corporeality and to

psychology, which comes not from a spiritual approach but from a dualistic approach.

Some modern conceptions of personhood have been strongly influenced by the dualistic conception of Descartes. If the body can be considered as a material substance subjected to mechanical interactions, then subjectivity must be considered as a distinct kind of substance whose link with the body is difficult to understand. The post-Cartesian philosophy has faced this problem with different strategies. One of them is the position of Spinoza, which affirms that the whole nature is a unique substance that can be considered legitimately both as a connection of ideas and as a material realm that can be explained through mechanistic laws. In this context, Locke has advanced an influential definition of the person. According to him, the person is different from the living body and from the soul and resides on the conscious possibility of identification of past action as hers.

Nowadays most approaches to personhood have traits in common with the Lockean perspective: they claim that personal identity should be defined in terms of sameness of consciousness rather than sameness of substance (Schechtman 2011). According to Schechtman (2011) and Olson (2017), those approaches (Noonan 2006; Parfit 1984; Shoemaker 1984) focus the question of personhood in the concept of *psychological continuity* or *persistence* through time. A person at time  $t_2$  is the same as a person at earlier time  $t_1$  just in case she has a kind of psychological continuity. This view has experienced a development in the last century from first, simpler versions to wider, more sophisticated concepts of continuity. Updated psychological continuity theories face the problem posed by the existence of delusional memory-like experiences, and they define personal identity in terms of overlapping chains of psychological connections, rather than in terms of direct connections. A direct connection is the one between a memory of a past experience and the mental content of that memory, and an overlapping chain connection is the one between a memory, the mental content of it, and the real past experience of which it is a memory. With this difference, the delusional memory-like experiences, which are not caused by real past

experiences, must not be considered as real memory experiences and then cannot be considered as a criterion to define personal identity. These updated theories also take into account the problems posed by psychological connections other than memory, i.e., if I am now firing a gun, am I the same that yesterday decided to do it? (Schechtman 2011).

The debate around psychological continuity has found a difficult challenge in the so-called “fission” objection, according to which the brain of someone who has a redundant one (every experience in each hemisphere) is transplanted into the body of two different persons, in such a way that these last are in principle psychologically continuous with the former. Confronting this difficulty, it has been argued (and widely accepted) that personal identity should be understood in a reductionist way, so that the fact of a person’s identity over time just consists in the holding of certain more particular facts that can be explained in an impersonal way (Parfit 1984).

These conceptions of the person that follow the Lockean conception reduce personal identity to psychological continuity and operate a primary dissociation between the person and the living being that we consider a person (Güell et al. 2017). This view, which obscures the ontological reality of the person, has been very influential in posterior debates about personal identity. In fact, it weakens the concept of person and makes possible its rejection or the project of explaining it away as a delusion.

However, this conclusion can derive not from the inexistence of the person but from the lack of a good intellectual approach to the question. If we identify reality with objectivity, then what we call subjective must be reduced to it. This conclusion would be necessary if our intelligence were confined to understand reality only in an objective way, reducing it to what we can objectify in the same way we do with, for example, numbers, qualities, or things. However, this is not the case, for example, for Greek and Medieval philosophy, which accepts that we can know realities that we cannot objectify, as is the case for movement, causes, and principles. This is also the case especially for what we use to call subjectivity. Would it

be possible to extend intelligibility also to the realm of what we, in contrast to objectivity, tend to call the subjective side of reality? Some contemporary philosophical approaches open this possibility.

## Concluding Remarks

It is not possible to undertake a serious study of the notion of personhood without addressing the question of its spiritual dimension. As we have seen, the role we concede to this concept and to the features that belong to it is connected to the solution we offer to the questions about the ontology of the person and the methodology to study it. In summary, these two different views are possible. On the one hand, we can accept some kind of reductionist approach which considers personhood as a mere result or emergent property, and, on the other hand, we can accept personhood as the radical ontological feature of what we call persons, attributing to the spiritual and transcendent phenomenological characteristics of personhood a real status. From the outcome of this research depends not only our image of human beings but also the solution to relevant practical questions about the way of dealing with them.

### Synonyms

Pledge; Vow

### Definition

Professional oaths are arguably the oldest form of ethics management, going back at least as far as to Hippocrates of Kos (c. 400 BCE). They are promises made during public ceremonies that exhort oath-takers to treat the oath's beneficiaries in ways consistent with professional standards. They obtain their justification primarily from the social function of the profession. Their binding force and moral weight are generally larger than those of mere promises, from which they can be distinguished on account of their satisfying a number of additional formal and substantive conditions. Professional oaths, if carefully designed, may foster professionalism, facilitate moral deliberation, and enhance compliance with professional standards.

They can be criticized, however, for various reasons, including their dubious efficacy. Prominent examples of professional oaths are the MBA Oath, the Bankers Oath (part of law in the Netherlands), and the Hippocratic oath.

### Description

Despite their venerable history, professional oaths seemed to have lost their appeal as ethics management tools at the turn of the twenty-first century. Codes of ethics, ethics education programs, corporate social responsibility initiatives, and more had taken over their role. The only prominent oath (besides, perhaps, such things as coronation and loyalty oaths) was, at the time, the Hippocratic oath (or variants thereof) for physicians, due to Hippocrates of Kos or one of his students (c. 400 BCE). It has influenced most later professional oaths.

In the wake of the global financial crisis, however, professional oaths have reappeared. Oaths have been drafted for accountants, architects, asset managers, computing professionals, engineers, financial advisers, financial modelers, knowledge management professionals, micro-lenders, pharmacists, public health professionals, social workers, teachers, university managers, and veterinarians. Apart from the Hippocratic oath, the most prominent professional oaths to date are the MBA Oath and the Bankers Oath (part of law in the Netherlands).

Today, hardly any physician pledges by the original text of the Hippocratic oath. An influential version is the Declaration of Geneva, but various countries have their own oath or have no oath, while in other countries, each medical school uses its own version of the oath. Most of these variants address such concerns as patient confidentiality, discrimination, human rights violations, and respect for human life. The MBA Oath goes back to an initiative of Harvard Business School graduates (Anderson and Escher 2010), inspired by earlier initiatives at other business schools. It is probably the most famous oath in business today, with almost 9,000 signatories at the moment of writing, and addresses such topics as stakeholder management, self-interest, legal compliance, and sustainability. The Bankers Oath is the only recent oath with official legal status. It is part of the Banking Code of the Netherlands, effective as a code of conduct under Dutch civil law since January 2010 (Advisory Committee on the Future of Banks in the Netherlands 2009). Employees of most Dutch financial services firms are legally bound to pledge this oath. It contains references to integrity, legal compliance, confidentiality, and responsibility and obligates swearers to give priority to consumer interests in their daily decision-making.

## Formal Conditions

Professional oaths are a specific kind of promise, setting them apart from assertory oaths sworn to the truth of a statement (e.g., in courts). A promise must satisfy a number of additional conditions to qualify as a promissory oath (Sulmasy 1999; De Bruin 2016).

*Publicity* The promise has to be made in a public ceremony, allowing representatives of the profession, beneficiaries, and/or other parties to attend.

*Ceremony* Oaths are sworn during ceremonies that give the promise a particularly solemn character, often involving particular gestures, rituals, sacred or formal language, corporally touching certain sacred objects, etc.

*Commitment* An oath is a promise involving a fairly general commitment, both qua action and qua time frame, often speaking to the oath-taker as a whole person (with values such as integrity, honesty, and good faith) rather than referring to particular concrete actions.

*Beneficiaries* Professional oaths must refer to concrete beneficiaries (e.g., patients, consumers, and environment).

*Function* The promise contains a statement describing the social function of the profession (e.g., the health care of patients).

*Compliance* Oaths should describe the consequences of oath-breaking, legal, reputational, or otherwise.

*Transcendence* Oaths are promises sworn by reference to something that is held in general reverence and that typically transcends the oath-taker, including such things as religious deities, religious and non-religious concepts, objects, and texts (e.g., God, a country's constitution, the swearer's honor, dignity, and conscience).

Not all existing oaths satisfy these conditions. In particular, the consequences of non-compliance are often described not in the oath itself but rather in codes of conduct or legislation in which the oath is embedded. The MBA Oath is exemplary in the way it describes the social purpose of the management profession. Oath-takers declare that as managers, their "purpose is to serve the greater good by bringing together people and resources to create value that no single individual can build alone" and that therefore they will seek to enlarge "the value [their] enterprise can create for society over the long run." The transcendence condition is sometimes given up altogether (e.g., in statutory declarations).

## Substantive Conditions

Professional oaths have to satisfy three conditions concerning their content (De Bruin 2016).

*Beneficiaries* While the formal condition of beneficiaries is to the effect that professional oaths make reference to beneficiaries, the substantive condition holds that they specify the right beneficiaries, in light of the profession's social

function. In the context of professional and business ethics, this will generally be accomplished using stakeholder theory (Freeman 1984). The Declaration of Geneva refers to patients, primarily; and the MBA Oath mentions shareholders, employees, consumers, civil society, government, and environment.

All of the better-known professional oaths unjustifiably exclude competitors and suppliers among the beneficiaries.

*Principles* Oaths must name the principles professionals should use in ethical decision-making. *Compliance-based* principles are grounded in existing laws, regulations, and/or codes of conduct. The Declaration of Geneva, for instance, refers to human rights and civil liberties. *Deontological* principles are centered around such values as respect, dignity, personal worth, autonomy, and freedom and yield support for informed consent or consumer confidentiality. *Virtue ethical* principles are cast in terms of the oath-taker's honor, trustworthiness, or good faith, embodied in the ideal of the "good professional." *Consequentialist* principles raise awareness about the potential and likely consequences of the oath-taker's actions and typically stipulate a method of how to determine the relative importance of the interests of various beneficiaries. The Bankers Oath, for instance, makes clear that the interests of the client should take priority over those of other beneficiaries.

While some existing oaths use compliance-based, deontological, or virtue ethical principles, most draw from consequentialism primarily.

*Norms and values* The principle or principles contained in professional oaths offer general guidance. In addition, oaths mention norms and values furthering the specific social function of the profession. In most professional and business environments, this includes integrity, objectivity, competence, fairness, confidentiality, professionalism, and diligence (Ragatz and Duska 2010). *Integrity* is the ideal of the oath-taker's moral system forming a coherent whole (rather than an opposition between "family ethics" and "work ethics"). It also often is shorthand for the virtue of honesty. The aim of *objectivity* is to avoid conflicts of interest and to make oath-takers continuously aware of the potentially distorting

influence of behavioral biases on their professional judgment. Many professions require their members to hone their professional *competence* through permanent education programs. *Fairness* entails such things as equal treatment of similar cases or a principle of desert or merit. The Golden Rule (treat others as one would wish to be treated oneself) is also part of the norms and values of several professional oaths. *Confidentiality* is meant to ensure that clients feel free to share with their service providers the information that they need for optimal decision-making. Under the heading of *professionalism*, oath-takers are admonished to uphold and/or enhance the reputation of the profession. *Diligence*, finally, is a condition to the effect that professionals exercise due care and ensure that their support staff (who typically have not pledged a professional oath) act with a level of accuracy and integrity furthering the aims of the profession, consistent with the professional oath.

Few oaths include references to integrity and confidentiality. Most oaths seem to be primarily concerned with issues of objectivity, fairness, professionalism, and diligence.

## Function

Professional oaths fulfill three functions, roughly (De Bruin 2016).

*Fostering professionalism* Oaths may foster professional identity. Members are inducted in the profession in solemn ceremonies, rites de passage, in which the oath-takers show that they have completed their professional education. Professional oaths are also, if effective, a sign to the outside world that the oath-taker will conform to professional standards.

*Facilitating moral deliberation* Oath-takers use the text of the oath for guidance in concrete cases (e.g., quality control in hospitals, physician-assisted suicide, and confidentiality). It also provides teams of professionals with a common ground for moral discussions, given that they have pledged the same professional oath.

*Enhancing compliance* If effective, professional oaths may increase compliance with

norms, laws, regulations, and other normative expectations, particularly those made explicit in the text of the oath.

## Conceptual and Empirical Criticism

Professional oaths have been criticized on various grounds (De Bruin 2016).

*Redundancy* Professional oaths commit oath-takers to follow norms and values they have independent reason to conform to (general ethical norms, such as integrity, and legal norms such as confidentiality, professional requirements, etc.).

*Distrust* The obligation to swear an oath may be seen as condescending and as expressing unjustified distrust about the oath-taker's moral and professional capacities.

*Illusion* Professional oaths may give the public the impression that every profession member that has pledged the oath will live up to the highest professional standards. This is an illusion, however, because oaths are unlikely to deter scoundrels.

*Moral error* Professional oaths may contain proscriptions or prescriptions that some oath-takers may find immoral. Since oaths are promises with large moral weight and binding force, a conflict between the oath-taker's personal morality and norms and values expressed in the oath may lead to moral dilemmas (e.g., between client confidentiality and beneficence) that are difficult, if not impossible, to resolve.

*Ineffectiveness* There is little evidence supporting the belief that oaths actually enhance compliance or that they are necessary to facilitate moral deliberation and professionalism.

## Summary

Professional oaths are staging a comeback as ethics management tools. The most prominent examples, besides the Hippocratic oath, are the MBA Oath and the Bankers Oath (part of law in the Netherlands). Oaths are promises satisfying a number of additional formal and substantive conditions. While professional oaths are claimed to

foster professionalism, facilitate moral deliberation, and enhance legal compliance, emerging conceptual and empirical research leads to more somber conclusions. More research is clearly needed to examine the future prospects of professional oaths as a form of ethics management.

## Officer-Fiduciary Duties

Paul Weitzel  
University of Nebraska, Lincoln, NE, USA

### Synonyms

Duty of care; Duty of loyalty; Profit maximization; Shareholder value

### Introduction

Corporate officers owe a fiduciary duty to shareholders. The duties owed by a corporate officer are identical to those owed by members of the corporation's board of directors. These duties are divided into two subduties: the duty of care and the duty of loyalty. Statutes and case law have not clarified, and scholars disagree, as to whether these duties require profit maximization.

Courts often invoke the language of moral or ethical obligations when discussing these duties, making their cultural reach broader than what would be legally enforceable.

### Why Focus on Delaware?

In the United States, most major corporations are organized under Delaware law, so decisions about the internal duties within these corporation are governed by Delaware law. Because of this, most corporate legal practice focuses on Delaware law.

### Duty of Care

The duty of care requires that corporate officers “exercise an informed business judgment” when dealing with corporate interests (McMullin 2000). Essentially, they must be paying attention. The officer's good intentions are not relevant in a duty of care case, so an officer can breach the duty of care even when acting in good faith.

A typical duty of care case involves directors or officers who take some major corporate action too quickly and without thoroughly reviewing the data. Meetings surrounding major corporate decisions should be done deliberately, and minutes of those meetings should reflect that substantial care was taken to protect shareholder interests (Smith 1985).

### Duty of Loyalty

The duty of loyalty prohibits officers from acting against the interests of the corporation's shareholders. Unlike the duty of care, an officer's good intentions are relevant. To establish liability for breaching the duty of loyalty, a plaintiff must show that the officer “acted in bad faith” (In re Caremark 1996). Bad faith is not clearly defined, but there are a number of common ways this duty is breached.

The most straightforward breach of the duty of loyalty is when an officer takes assets, customer lists, or other resources from the company. Misappropriation is the clearest violation of the duty of loyalty.

Slightly less clear is when an officer takes an opportunity that might otherwise belong to the corporation. The analysis for misappropriating a corporate opportunity is more involved, but as a general matter, an officer cannot take an opportunity that the corporation would otherwise have been expected to take.

Another subset of the duty of loyalty is the duty of candor. The duty of candor prohibits a corporate officer from hiding critical information from the board of directors, which could include merger-pricing data, competing acquisition offers, or conflicts of interest (City of Fort Meyers 2020). The limits of this duty are not well defined. Advisors that are neither officers nor directors who have withheld critical information have been held liable for aiding and abetting breaches of the duty of candor (City of Fort Meyers 2020).

Another subset of the duty of loyalty is the duty of oversight, sometimes called *Caremark* duties. An officer breaches the duty of oversight when the oversight is so faulty that it constitutes bad faith.

These cases rarely succeed and have been called “possibly the most difficult theory in corporation law upon which a plaintiff might hope to win a judgment” (In re Caremark 1996). The lack of oversight must be over a mission critical piece of the company’s business, for example, food safety for an ice cream company or flight safety for an airline manufacturer.

### **A Duty to Maximize Profits?**

The dominant academic theory of corporate purpose is shareholder primacy, which requires officers to maximize shareholder wealth. However, scholars continue to debate whether profit maximization is theoretically sound, whether it is legally enforceable, and whether it accurately describes reality (Weitzel and Rodgers 2015).

Under the narrowest theory, corporations operate for the benefit of shareholders, and the only benefit shareholders universally value is profit, so corporations should maximize profits (Bainbridge 2008).

The “broad shareholder value” theory agrees that corporations operate for the benefit of the shareholders but recognizes that the ultimate shareholders are humans, and humans also value nonmonetary interests. These nonmonetary interests could include safety, environmental, social, or other considerations. In extreme circumstances, those nonmonetary interests could outweigh the monetary interests for a majority of shareholders. In those extreme situations, an officer best serves the majority of shareholders by prioritizing the nonmonetary interests. While these extreme situations may be rare, directors and officers must always ask whether the situation in front of them is one of those extreme situations. This means that in practice, directors and officers must consider the nonmonetary consequences of their decisions in each decision they make (Weitzel 2015). Under the broad shareholder value theory, weighing matters of conscience is not only proper but also inevitable.

Stakeholder theories go a step further, arguing that a corporation does not operate exclusively for the benefit of the shareholders, but that it operates for the benefit of all corporate stakeholders. These

theories vary widely in their boundaries and prescriptions, with some taking the more modest claim that stakeholder interests can be considered while others treat stakeholder interests with the same importance as shareholder interests (Stout 2012). Delaware has not recognized or adopted these stakeholder theories.

### **Theoretical Support for Officer-Fiduciary Duties**

Scholars have criticized the theoretical foundations of officer-fiduciary duties. Unlike most who owe fiduciary duties, corporate officers are directly supervised by experts in their field with full access to any records relating to the officer’s performance. This reduces the vulnerability and risk of opportunism that typically accompanies fiduciary relationships (Weitzel 2021).

Similarly, while most fiduciary relationships involve the beneficiary entrusting an asset to the fiduciary, here, shareholders have no claim on any assets that the officer manages. For example, an Amazon shareholder does not own some portion of its warehouses. Similarly, shareholders typically receive dividends not by right, but at the discretion of the board of directors. Share value and dividends are correlated with managerial performance, but correlation relationships are not a typical basis for fiduciary duties (Weitzel 2021).

### **Enforcement Considerations**

#### **Exculpatory Clauses**

Delaware allows a corporation to exculpate directors (but not officers) from the duty of care by adopting an exculpatory provision to its charter (Delaware § 102(b) (7)). Because claims are most often made against directors, rather than officers, these ubiquitous exculpatory clauses have shifted the litigation landscape toward the duty of loyalty and away from the duty of care.

#### **Business Judgment Rule**

The business judgment rule attempts to balance the need to hold corporate officers accountable while also recognizing the need for them to act

with limited information. It creates a presumption that “decisions are made in good faith and are based upon sound and informed business judgment” (Unocal 1985). A plaintiff must rebut this presumption to succeed on a duty of care claim. As a practical matter, this requires a plaintiff to show that the officer was self-dealing, entirely uninformed, or grossly negligent.

### Directors and Officers Insurance

Even if an officer is found to have breached the duty of care or duty of loyalty, any payment is likely to be predominantly from insurance proceeds. This further reduces the deterrent effect of fiduciary duties. An officer charged with violating the duty of care or duty of loyalty should review the corporation’s directors and officers’ insurance.

## Online Employees and Employer Relations

AnnaMaria Bliven

Management, University of Wisconsin-Whitewater College of Business and Economics, Whitewater, WI, USA

### Synonyms

e-commuting; Flex work; Remote working; Telecommuting; Virtual working; Work at home; Work from home

### Introduction

For any relationship to operate, there must be communication between the parties. For the relationship to grow and thrive, communication must take place frequently with openness and acceptance. Short of that, and the relationship is doomed to fail. In the case of remote employees and online employers, the failure of this relationship precedes the employee leaving their manager, not the company. Preventing this from happening takes a special tri-communication approach: intentional, interactional, and interpersonal.

## Online Employees and Employers Working Relationship for Best Outcomes: Covid-19 and Its Workplace Ramifications

COVID-19 Pandemic caused an office shut down in the United States lasting for 18 months. The office shut down occurred from March 13, 2020, when the USA President declared COVID-19 Pandemic a national emergency. Approximately April 2021 is when offices began re-opening (Smart 2022). From March 2020 to April 2021, the office shut down forced the management and supervision of employees to take place online, and not in a shared physical workspace. Both employees and employers were caught in a

whirlwind of sudden change in their physical, psychological, and social working relationship. What happened in this working relationship during the pandemic office shut down set a precedence for the future of the office workforce relationship.

Suddenly, in March 2020, and without warning or training, managers had to manage their employees working remotely. The managers and the [2020] remote employees were faced with a working environment very unfamiliar. Now there were more aspects of this relationship facing a challenge never faced before, such as trust (Norman et al. 2020), respect, value, equity, and inclusion. The shutdown workforce challenge became instant, and the employers and employees had to work together somehow to the satisfaction of both sides. Several months of the workforce working in the shutdown eventually found a way for managers to manage, and employees to continue their work effort.

The post-pandemic working relationship between employees and employers is consequently in an uproar (van Zoonen et al. 2021). Having had the experience of working at home, many employees wish to continue working at home citing the benefits such as work/life balance, the absence of childcare and transportation issues, and the overall satisfaction of having the time to work and be with their family. There is an increasing demand by employees for their employers to continue allowing them the freedom and autonomy that was inherent in the working arrangement during the pandemic shut down (Liu 2022). Employers, feeling the pressure by their employees, are in a quandary, like never before.

The freedom and autonomy of the employees continuing to work remotely is causing a challenge to the online employers' managers. Managing a remote workforce is not the same as managing a workforce sharing the same workspace. For the relationship to survive these challenges and thrive in a remote/hybrid working environment, managing remote employees takes intentional, interactional, and interpersonal communication.

## **Remote Management Relations with Intentional, Interactional, and Interpersonal Communication**

### **Intentional Communication**

Communication between a manager and their employee is paramount to job satisfaction (Jalalkamali et al. 2016), job retention (Tirta and Enrika 2020), the growth and development of both parties (Richardson 2010), and productivity (Campbell 2015). It is easier and natural for this communication to occur when the manager and the employee work in the same physical space, and not as easy when the employee is working remotely. For this reason, the communication flow only happens at the level of the **intention** for it to happen. The employer must have a culture that includes open communication policy and a frequent dialogue taking place, especially when managing employees working remotely. No one wants to speak into a void. The message spoken is meant to be heard and accepted, especially in a working relationship between the manager and employee.

### **Interactional Communication**

As managers of employees working remotely, constant and consistent communication is not the only way to stay in touch. Intentionally communicating with interactional communication takes managing remote employees to a higher level (Kyei-Poku 2014). When **interactional communication** occurs, there is active listening, empathy, and caring taking place during the interchange of information, ideas, opinions, etc. The manager is attentive to the employee and invites conversation. As a result, the employee is comfortable with sharing their thoughts and expressing themselves openly and honestly. In exchange, the manager does the same. This is the engagement of interacting taking place between a manager and employee. The level of engagement has been noted to be driven by the level of closeness and affinity felt between the parties.

### Interpersonal Communication

Interpersonal communication occurs when two people share their personal selves truthfully, openly, and honestly (DeKay 2012). How is this different than interactional communication? Interactional communication occurs with the other person listening, empathizing, and caring, and **interpersonal communication** occurs when the person is sharing and expressing themselves. The act of interpersonal communication taking place makes it possible for this employee and employer relationship to occur with equity. For that moment of interchange, the sender of the message, and the receiver of the message are on equal ground. There is no judgment or barriers, just openness and acceptance. So, for the manager and employee working apart from each other, interpersonal communication must ensue on a regular and predictable basis and take place with interactional communication happening intentionally.

### Advancing Diversity, Inclusion, and Equity with Remote Workplace Communication

Intentional communication taking place with interpersonal communication fosters trust. Making the effort to invite openness, vulnerability, and honesty with acceptance, honor, and value draws inward a bond between the manager and employee. This is especially needed when the manager and employee do not work in the same physical space. Having interactional communication intentionally, creates a work atmosphere that

is solidly based in a culture where people of diverse backgrounds feel accepted and included and where this is a sense of equity (Fig. 1).

### Expected Outcomes

Communication flowing intentionally, with a mix of interactional and interpersonal communication builds the basis by which a healthy working relationship occurs between the employer and remote employee. Trust and confidence on both sides is a byproduct of this type of tri-communication. We all know that communication is the key to establishing and maintaining any relationship, so it should come as no surprise that in the case of the working relationship between employers and remote employees, communication would be a chief factor and the focus of this article. Given the work climate of the post-pandemic, the pressures placed on the employers by employees demanding to continue working at home, and the future of the workforce development, it behooves us all to intentionally communicate using both interactional and interpersonal communication. What results from this is nothing short of trust, cohesiveness, closeness, affinity, loyalty, acceptance, motivation, productivity, collaboration, innovation, safe workplace, positive mental health. All factors of a healthy and thriving relationship between employers and remote employees. Remote working is here to stay and communicating interpersonally and interactionally,

**Online Employees and Employer Relations,**  
**Fig. 1** Tri-communication model. (Created by Dr. AnnaMaria Bliven)

with full intention is the one sure way for employers and remote employees to thrive in their relationship and face the challenges victoriously.

## Organizational Culture and Corruption

Davide Torsello

Center for Business Integrity, Department of Economics and Business, Central European University, Budapest, Hungary

## Synonyms

Corruption culture; Organizational corruption

## Definition

Organizational culture is “a set of taken for granted assumptions divided as ‘artifacts’ (visible organizational structures and processes), ‘values’ (strategies, goals and philosophies), and ‘underlying assumptions’ (unconscious and taken for granted beliefs, habits of perception, thoughts and feelings)” (Schein 1990: 9–10).

## Introduction

The relationship between organizational culture and corruption may appear not immediate, since the common assumption that corruption is determined by individual or organizational profit-seeking behavior tends to minimize the importance of cultural aspects in organizations. However, as abundant interdisciplinary literature and case studies have suggested, seeking for a general ethical standpoint in business relations is one thing, creating the environment in which an

organization builds up a compliance and integrity culture is another. The salience of the organizational culture approach to study corruption and white-collar crimes is situated in the understanding and providing empirically grounded analyses which focus on the visible and less visible aspects of organizations that influence ethical behavior, the dynamics through which ethical behavior and choice-making is transmitted within the organization, the processes through which members internalize ethical behavior and provide it meaning, and the ways how organizational change affects the communication and implementation of integrity mechanisms.

The study of integrity in business organizations is a wide research field that has gained momentum over the last two decades. Some recent literature reviews show that in the research agenda of this topic, at least three tendencies can be identified (Campbell and Göritz 2014). The first is toward conceiving organizational integrity in terms of a relationship between individuals and the organization. In this perspective, individuals may commit corruption because of their own, individual, decisions, and at the expenses of the organization. This is the classical “rotten apple” approach, in which a single, for instance, a sales manager, decides to pay a bribe in order to obtain a contract, without informing this action to his superiors in the company. Within this approach, integrity breaches, such as bribery, are identified mainly as outcomes of individual choices made in spite of the norms and policies regulating ethical conduct in an organization (Misangyi et al. 2008). The second tendency, on the opposite side, is to identify corruption and other forms of unethical behavior within a collusion pattern between the individual and his workplace. Rather than focusing on individual choices, this stream of research typically deals with forms of organized corruption and unethical behavior within organizations (Ashford and Anand 2003; Palmer 2008). This is the classic case of corruption in which a number of mid- to senior level of managers and other employees are involved to create a “system” of bribing schemes. In the third tendency, more recent work in the fields of social psychology,

sociology, and social anthropology has taken a different standpoint, focusing on cultural aspects, both internal and external to the organization, to deal with corruption. In this scholarship, corruption is, similarly to the other two approaches, the result of choices and strategies promoted by individuals, but these are framed within a cultural and behavioral analysis that draws on the specificities of the cultural origin of the individuals involved and of the culture of the organization (Torsello and Venard 2016).

The first approach prevalently tackles corruption from an individual profit-seeking perspective. This has its origins in from the leading assumption that corrupt individuals are profit-seekers and economically rational beings (Shleifer and Vishny 1993). Corruption would occur as a response to occasions of pursuing gain and the discretionary power to approach such gain. This perspective, however, tends to minimize the role of organizations and of the behavior of actors playing roles within them. This is the general focus of the second approach to organizational collusion, which relates to the study of “the normative and cognitive impacts of the social situations that inform and influence behavior in organizations” (Misangyi et al. 2008: 752). One main field of research in organization studies and organizational behavior is the interplay between organizational functions and forces. For example, one structural approach is developed by Luo (2005), which recognizes organizational corruption as built into four patterns that belong to a matrix of two dimension: hierarchic levels (power structures in the organization) and intensity of corruption. The four positions are described as procedural (low hierarchy-low corruption), structural (high hierarchy-low corruption), categorical (low hierarchy-high corruption), and system malfeasance (high hierarchy-high corruption). Procedural corruption happens in organizations where misconduct is not systematic but sporadic, and it appears mostly in subunit levels, with low hierarchy involved. On the contrary, in system malfeasance corruption is expected to take place at different levels and subunits of the organization, with different degrees of hierarchy involved.

Another approach in the organizational collusion perspective departs from the assumption that there has been in the specialized literature a good degree of exaggeration over the secrecy that accompanies individual unethical behavior (Anand et al. 2005). It is through a number of practices that take place at company level that individuals learn how to be corrupt. These practices include rationalizing (to make corrupt practices appear normal), denial of responsibility (to accept the “everyone does it” explanation or denying that circumstances can be changed at all), denial of injury (to believe that no one has been harmed), denial of victim (to believe that the victim, such as a competitor, deserved to be harmed or that there is no personalized victim at all), appeal to higher loyalties (to exalt group cohesion and interests as of primary importance), and balancing the ledger (to believe that the end justifies the means). Apart from these psychological forms of rationalization, a number of socialization tactics are used to rationalize corrupt behavior in organizations. These include co-optation (the idea that rewards justifies unethical behavior), incrementalism (the process through which newcomers in the organization are gradually introduced to forms of unethical behavior), and compromise (the idea that unethical behavior is accepted in order to resolve role conflicts and other internal organization problems).

Two distinctions have been fundamentally made about the organizational corruption control types: the first is outcome vs. process control orientation and the second is between controls transmitted through administrative vs. sociocultural channels (Lange 2008). The first set of differences focuses on the agency of individual decision-maker and the second to organizational issues. Outcome-oriented control focuses on rewards and sanctions, whereas process control are measures that are called in intervention previously or during the illicit act. On the other hand, sociocultural controls are carried by the beliefs, values, and cultural aspects of the organizations, and administrative forms of control are performed through formal structures and routines, particularly by authority.

## Organizational Culture's Aspects Influencing Integrity

Following the third approach to organizational and national cultural aspects, the organizational culture's features that influence corrupt choices are of uneasy delineation. Even if there is a general degree of agreement among scholars on their weight, apart from leadership, motivation, company structure, change, as well as the national cultures of leaders and managers, few attempts have been done to systematize their role in different organizations. One general agreement is on the idea that the incidence of cultural aspects needs to be weighed upon at least four aspects: the industrial factors; the internal or functional aspects of the organization, of its headquarter, and of its subsidiaries in countries of operation; the kind and degree of changes the organization has undertaken over the years; and determinant sociocultural aspects. Rather than thinking that each of these four aspects has its own weight, it is more appropriate to focus on their influence, not as a single but a set of synergies on managerial practices and their interpretation within the organization. In this way, the analysis of cultural aspects that may breed corruption becomes a dynamic approach which takes into consideration the possible array of factors without isolating them (Dong et al. 2013).

Concerning the inner environmental- or industry-level factors, these include typically industry cultures, norms, and histories, investment perspectives, payback periods and returns, concentration, environmental hostility, and environmental dynamism and heterogeneity (Zahra et al. 2007). Organization-level pressures may include separation of ownership and control systems, external and internal legal and regulatory systems, board composition, separation of the board chair and CEO, senior leadership style, and organizational culture. Organizational culture aspects of particular relevance are leadership, compartmentalization of identities, and climates of fear and social learning. Finally, individual factors can include age, gender, work experience, and self-control.

Among the functional aspects of organizational culture that lead to corruption can be pointed out: fragmentation of information, i.e., when information is present elsewhere in the organization, leading to insulation and also to incapability to get the big picture, which is needed for a long-term integrity strategy. Diffuse responsibility allows corrupt organizations to cover up frauds and make responsibility less detectable; rules, schemas, and scripts that guide task performance may have the negative consequence, when abused, of shifting focus on the efficient and effective completion of tasks rather than on the ends that their performance is deemed to achieve (Palmer 2008). Commitment processes can facilitate wrongdoing when organizational members initiate a course of action without properly assessing the intentions and possible outcomes. Communication channels determine the amount and type of information available and hence shape decisions accordingly. Technology, seen as a determinant of organizational structure, may intentionally or unintentionally influence wrongdoings in particular when the control and operationalization of technology is in the hands of small circles of individuals and not accessible to many in the organization. Social influence processes, in particular those expressed by the work of Cialdini (2001), may all be bearers of conditions that can fall into corruption. One of this is the norm of reciprocity, on which a well-developed literature exemplifies its cultural relevance, as it is described below.

### **Sociocultural Determinants**

In the recent literature from anthropology, what has been termed the “transactional approach” has studied corruption as a mechanism of interaction between different actors and levels of political and economic decision-making. A number of ethnographic studies have showed that corruption exemplifies a failure of the State to encompass local government or an incomplete bureaucratization process (De Vries 2007). Competition

between local governmental organizations and the State becomes one potential subject of analysis in reference to different sociocultural contexts (Smart and Hsu 2007; Goldstein 2003). For example, in his study about the effects of European Union structural transport projects in Central Eastern Europe, Torsello has been confronted with the issue whether corruption has been fostered by the attempt of the State to enforce its decision-making processes at local levels, or the opposite, by the attempt of local governments and companies to seek autonomy from State intervention (2012). He has found that one fruitful way to analyze the spreading of corruption in relation with EU enlargement politics is through attention to competition between State and local governments over EU funds and the role of business organizations to channel such funds. After experiencing a profound process of institutional transformation, Eastern Europe has entered a similarly problematic phase of alignment with EU accession requirements and afterward structural development policies. Corruption is a mechanism that not simply allows the classical “greasing of the wheel,” but it generates conflicting sociocultural dynamics of interaction and transaction between national, local, and transactional organizations. Some of these dynamics may have seemingly positive outcomes (such as building an infrastructure or ameliorating an urban space), but in most of the case, the loss of legitimacy of the public and private actors implicated in these transactions is under the eyes of the wide public.

Another approach to study sociocultural determinants of corruption that may facilitate corruption in organizations is the focus on petty corruption. During research, anthropologists and sociologists may become exposed to the observation of bribery and gift exchange patterns in economic transactions, be these semilegal or illegal practices. Being in the troublesome position to judge whose good are serving those practices, the common tendency is to objectivize the meaning of those practices framing them into the sociocultural context of belonging, which lead to the abovementioned distaste for clear-cut categories

(Haller and Shore 2005). One example is Yang's work on *guanxi* (personal connections) in China (2002). These are practices substantiated through the widespread use of gift exchanges in interpersonal relations where favors are granted. Yang reflects on the inappropriate use that some scholars have made of her interpretation of such practices which she saw emerging in the times of the Cultural Revolution as a reaction to conditions of excessive state inherence in the public life. This study treats *guanxi* not as a given set of cultural practices, but as historically specific product acquiring different meanings and deployments along several interest groups. As a culturally recognized form of gift exchange, *guanxi* and other similar practices observed in different world regions (Latin America, Southern and Eastern Europe, Africa) can be perceived as patterns of sociability that defines ways how different sets of actors can interact within and/or outside of schemes of state control and institutions. In the case of *guanxi*, connections are justified by the Confucian virtue of connectedness, according to which individuals are not single atomized beings, but social beings inserted in nested relations (from the family all the way up to the state), without which a person (contrarily to the western philosophical tradition) is not characterizable, or, as the Japanese say, he does not have a "social face" (*hitomae*). Some of these approaches in the anthropology of corruption have generated what can be called the "social exchange theory of corruption." Organizational collusion is, in this perspective, broadened to incorporate a number of sociocultural practices that facilitate the arising of petty corruption since gift-giving is considered an important form of politeness and local etiquette.

Consideration provided to the role of sociocultural determinants of corruption can help to shed lights onto the ways how organizations react to cultural awareness and diversity. In a global context, it is increasingly more important to be able to pinpoint those gray-zone practices which due to organizational and national cultural features may be uncritically accepted or eventually perceived as socially ethical, such as in the case of petty corruption.

## Panama Papers

Alex C. Michalos  
University of Northern British Columbia, Ottawa,  
ON, Canada

### Synonyms

Financial services intermediaries; Luxembourg tax files; Paradise papers; Shell company documents; Tax haven documents; Tax haven intermediaries; Tax havens

### Definition

The Panama Papers is the largest set of tax haven documents released so far, focused primarily on one company but revealing the worldwide use of financial intermediaries to help wealthy individuals and corporations avoid and evade taxes, rules, regulations, laws, and obligations at the expense of other citizens, competitors, and governments.

### Description

Sometime in 2015, Bastian Obermayer, a journalist with the German newspaper *Süddeutsche Zeitung*, was contacted by someone calling himself or herself “John Doe.” Doe was apparently

a whistleblower offering Obermayer “secret data” apparently stolen from a firm incorporated in Panama by the name of Mossack Fonseca, Mossfon for short. In a statement written for Obermayer and Obermaier (2016, pp. 340–344), Doe wrote,

For the record, I do not work for any government or intelligence agency, directly or as a contractor, and I never have. My viewpoint is entirely my own, as was my decision to share the documents with the *Süddeutsche Zeitung* and the International Consortium of Investigative Journalists (ICIJ), not for any specific political purpose, but simply because I understood enough about their contents to realize the scale of the injustices they described.

Insisting that banks, financial regulators, tax authorities, the media, and the legal profession had failed to address the serious violations of moral and legal principles he had discovered in the documents he released, Doe asserted that “when it takes a whistle-blower to sound the alarm, it is cause for even greater concern. It signals that democracy’s checks and balances have all failed, that the breakdown is systemic, and that severe instability could be just around the corner.” He reminded readers that notable whistle-blowers and ordinary journalists who had revealed violations and publicly criticized the violators and their witting enablers had been not only unprotected but even prosecuted by authorities and sometimes murdered by those exposed and their hired assailants. At a minimum, he wrote, “Legitimate whistle-blowers

who expose unquestionable wrong-doing, whether insiders or outsiders, deserve immunity from government retribution, full stop.”

Obermayer and Obermaier planned to have a very public, very international release of what came to be called “The Panama Papers” in the spring of 2016, recalling the famous Pentagon Papers from 1971. What came out became “the beginning of the largest international investigative journalism project of all time. Ultimately, around 400 journalists from over eighty countries... [including 90 media organizations, investigated] stories originating from this [sic] data.” The size of the data collection was far beyond any other collection released by or since then. There were 2600 gigabytes (2.6 terabytes = 2.6 trillion bytes), over 8.2 million files. “By way of comparison,” they wrote, “the diplomatic cables published by WikiLeaks amounted to 1.7 gigabytes; the HSBC Files, based on Hervé Falciani’s documents, 3.3 gigabytes; the Luxembourg Tax Files 4 gigabytes; the WikiLeaks Afghanistan protocols 1.4 gigabytes” (Obermayer and Obermaier 2016, p. 70). Initially the authors tried to visualize the size of their data in terms of numbers of printed Bibles, but they gave up because they found it “difficult to imagine a pile of more than a million copies of the Bible.”

What was found in the papers? Regarding Mossack itself, Jürgen Mossack, a lawyer and Ramón Fonseca, a politician and writer, formed the law firm Mossack Fonseca in 1986. The firm consisted of a huge web of roughly 100 active companies plus 100 shell companies, with a dozen holding companies, trusts, and some foundations pasting a variety of subsidiaries together. Fifty offices of these companies existed in 30 jurisdictions, countries, and territories, representing either subsidiaries or partners. The jurisdictions included notorious and not so notorious tax havens, e.g., Panama, British Virgin Islands, Seychelles, Bermuda, Samoa, British Anguilla, Colombia, Luxembourg, El Salvador, Hong Kong, and the US states of Nevada, Wyoming, and Florida.

In 2013, the web contained around 600 employees, with relatively few of this number playing the role of nominee director which is

a man or woman “ostensibly leading ‘their’ companies.” The leadership of nominee directors is as fictitious as shell companies’ productivity. For example, a woman named “Leticia Montoya,” who spoke little English and had never gone to secondary school, served as the nominee director of “more than 25,000 companies” over some years. In 2012, she was listed as a nominee director in 3,143 shell companies (Obermayer and Obermaier 2016, pp. 171–173, 322).

On top of all the in-house players, the web was supported by an enormous number of intermediary enablers. “Despite repeated fines and documented regulatory violations,” Obermayer and Obermaier (2016, pp. 343–344) wrote, [the web] “found allies and clients at major law firms in virtually every nation,” including over “500 banks worldwide” (p. 245). Clients owning over 214,000 shell companies included

“drug lords, financial fraudsters, mafiosi, arms smugglers, tax evaders, sanction breakers [and] pretty much every type of fraudster” (p. 217), “as well as investors who do not wish to reveal their true identities and their true intentions, senior politicians who’d like to spirit their wealth abroad (perhaps because they have accumulated it dishonestly) and companies looking to funnel bribes... [including] famous directors and actresses, South American singers worshipped like gods in their own country, brilliant chess players and a whole string of owners and chairmen of top-flight football clubs”. (pp. 11, 287)

Mossack and Fonseca had their own companies apparently shielding a variety of assets from tax collectors and perhaps creditors. The variety is quite extraordinary. For example, Mossack had individual companies owning “a couple of *fincas*, ... a penthouse, ... his helicopter hangar, ... his helicopter, ... his teak plantation, ... his gold, ... his yacht, ... his Mercedes, ... his Volvo, ... his Mazda and the Chevrolet Tahoe”. The Mossack Family Foundation, registered in Switzerland, owned most of his companies and the “primary beneficiary” of the Foundation was Mossack, with “children and stepchildren” listed as “subordinated beneficiaries” (pp. 174–175).

Following release of the Panama Papers, there were challenged and unchallenged news media reports, resignations and terminations,

indictments, and prosecutions around the globe. In February 2017, Jürgen Mossack and Ramón Fonseca were arrested and charged with money laundering. In April 2017, The Panama Papers won the Pulitzer Prize for “explanatory reporting.” In March 2018, Mossack Fonseca shut its doors, reporting that

The reputational deterioration, the media campaign, the financial siege and the irregular actions of some Panamanian authorities have caused irreparable damage, whose obligatory consequence is the total cessation of operations to the public. (Fitzgibbon 2018)

By November 2018, it was reported that over \$700 million in unpaid taxes had been recovered by governments in Europe, Africa, Asia, and the USA (Fitzgibbon et al. 2018). By April 2019, \$1.2 billion had been collected globally in “fines and back taxes resulting from the Panama Papers” (Dalby and Wilson-Chapman 2019). That is a very small percentage of the world’s total estimated offshore wealth of \$5.6 trillion (Alstadsæter et al. 2017), but it is a significant advance for international efforts addressing a very troublesome problem. Perhaps more importantly, there is an “enduring legacy of the Panama Papers . . . [through] its effect on behavior and public attitudes. . . Although many of the methods of evading tax detailed in the Panama Papers were legal, their use has since been widely condemned in the court of public opinion . . . a failure to pay a fair share of tax is no longer considered a victimless crime” (Dalby and Wilson-Chapman 2019).

Pay equality; Pay fairness

## Introduction

Fair compensation across demographic subgroups remains a salient issue in the modern-day workplace. Indeed, unfair compensation across gender (i.e., pay inequity) is an important contributor to the gender wage gap. This entry focuses on the gender pay gap and pay inequity between men and women in the United States, but simultaneously offers generalizable insights to pay inequity for other demographic subgroups and other regions of the world as well. This entry begins by defining terms and describing how pay inequity

contributes to the gender pay gap. Next, legislation passed to give employees a means to challenge gendered pay inequity is discussed. Finally, this entry concludes with options for organizations to monitor and address pay inequity.

## Pay Equity/Inequity Issues

### The Gender Pay Gap and Pay Inequity

For the purposes of this entry, *gender pay inequity* describes a woman and a man receiving unequal compensation despite performing the same work, and occupying the same position, absent any important differences in seniority, merit, quality, or quantity of production, or a job factor other than sex (Sady et al. 2015). The *gender pay gap* refers to an mean level difference in compensation between women and men. Utilizing a psychological and historical approach can provide insight into how gender pay inequity contributes to the gender pay gap.

Within the United States, female employees, on average, are paid significantly less than male employees (Sady et al. 2015). The root causes of the pay gap have been vigorously debated. Blau and Kahn (2007) provided insight into the factors that contribute to the gender pay gap, finding that, of the variables studied, occupational category contributed the most (27.4%) followed by industry category (21.9%), labor force experience (10.5%), union status (3.5%), and race (2.4%). Interestingly, incorporating educational attainment into the analysis did not narrow the pay gap as women in the USA now have a higher average level of education compared to men.

Considering the history and psychological factors associated with these variables sheds light on why they lead to women earning less than men, on average. For example, when examining why gender differences exist in labor force experiences (which lead to women being paid less than men), many women have, historically, entered and exited the workforce based on family care needs (Blau and Kahn 2007). The resulting lack of continuous work experiences for women subsequently decreases promotion and job training opportunities that lead to salary increases, thereby

widening the pay gap. As a second example, gender differences in vocational interests (Su et al. 2009) and the extent to which different occupations are family-friendly (i.e., allowing women to fulfill gender roles as caretakers in their families; Sabbatini and Crosby 2009) can explain why gender segregation exists across occupational and industry categories. When accompanied by evidence showing that the market has assigned higher value to skills and abilities utilized in male-dominated occupations (Blau and Kahn 2007; Junor et al. 2009), it becomes clearer why and how occupation and industry contribute to the pay gap. While systematic of an employment structure that (perhaps unfairly) advantages men, these variables do not constitute pay inequity as defined above, which focuses on pay differences between women and men in the *same job*.

Returning to Blau and Khan's study, 41.1% of the variance in the gender pay gap remained unaccounted for by the variables included in the analysis (i.e., those listed above). While there were multiple potential contributors to the pay gap that were not included, experimental research backs up the notion that at least some of this variance can be accounted for by pay inequity (i.e., differences in pay between men and women in the same job that is not attributable to legitimate factors). For example, Moss-Racusin et al. (2012) found that resumes of individuals with stereotypical male names were offered more money for the same job than identical resumes of individuals with stereotypically female names.

Social role theory may provide a means to explain the origin and perpetuation of gender inequity (Eagly et al. 2004). It lays out a series of mechanisms that begin with the biological differences between men and women. Men, on average, are larger and have greater physical strength than women whose reproductive abilities most saliently physically differentiate them from men. These sex differences have created different patterns of behavior among men and women. Historically, men's strength and size, on average, have allowed them to better engage in activities like hunting and warfare, while women who were occupied with reproductive activities and subsequent childcare responsibilities were limited from

engaging in male-dominated activities. Because of these differences, men have developed agentic characteristics (e.g., independence, assertiveness) and have typically carried out tasks that made them the “breadwinner,” whereas women have developed communal characteristics (e.g., caring for others, helping others) and occupied the role of “homemaker” due to their reproductive abilities and childcare responsibilities.

Stereotypes based on expectations that men and women will fulfill these different roles and endorse these different characteristics provide a potential means to understand not only why masculine occupations and skills would be valued more but also why individual women will be given less compensation than a man in the same job. For example, a woman in a leadership role may be compensated less favorably than a man in the exact same role because she is perceived as less competent and powerful and therefore deserving of less pay.

### Pay Equality Legislation

To counteract pay inequality, many countries have passed laws that require organizations to pay women and men equally when they complete the same tasks in the same role (Myors et al. 2008). As an example, this entry summarizes the primary US federal laws used to prevent and address pay inequity.

Following World War II, the US Congress began to consider legislation requiring equal wages as women represented a significant portion of the United States workforce at that time (Gutman et al. 2011). In 1963, the Equal Pay Act (EPA) was enacted by Congress amending a previous fair pay act and creating pay equality legislation that still stands today. To increase congressional support for the EPA, the terminology “equal” was used to denote that jobs that were equal, rather than comparable in worth, should be compensated equally. This law prohibits illegitimate differences in compensation between men and women who perform equal work (Sady et al. 2015). Furthermore, compensation differences are only legal and legitimate when explained using one of four defenses: seniority, merit, quantity or quality of production, or a job factor other than sex. Importantly, an organization cannot provide a

defense that argues market forces prompted lower pay, meaning that an organization cannot justify paying a female employee less than a male employee by arguing that the higher wage for the male employee was necessary based on what the market demands to successfully recruit or retain such an individual (Vodanovich and Rupp 2022).

Employees may also challenge pay inequity through Title VII of the Civil Rights Act of 1964 (Vodanovich and Rupp 2022).<sup>1</sup> Although the EPA and Title VII are similar in that they both protect employees from experiencing gender-based pay discrimination and signal to organizations the importance of pay equality; they also differ in a few key ways. First, the EPA requires that two individuals perform *equal* work to qualify as equivalent, whereas Title VII only requires two individuals to be *similarly situated* in their positions (EEOC 2000). Therefore, Title VII takes a more lenient approach to interpreting which individuals can be compared for the determination of pay equality. Somewhat unclear is exactly what “equal” work means in the context of the EPA; however, courts have generally interpreted equal work narrowly. According to the EPA, work must be equal in terms of skill, effort, responsibility, and working conditions. Another substantial difference between the EPA and Title VII is the burden of proof required (Vodanovich and Rupp 2022). For a difference in pay between two similarly situated employees to be illegal under Title VII, it must be shown that the pay discrimination was intentional. Alternatively, unintentional differences in pay between employees in the same role performing the same work are illegal under the EPA, unless explained by seniority, merit, quality, or quantity of production, or a job factor other than sex. Also, the EPA, unlike Title VII, requires that the two compared individuals work in the same *establishment*, which generally means the same physical location (EEOC 2000).

Because EPA and Title VII pay equality cases are civil cases, the burden of proof is met through

<sup>1</sup>In addition to prohibiting gender-based pay discrimination, Title VII prohibits pay discrimination on the basis of other protected group identities, including race, color, religion, and national origin (Sady et al. 2015).

demonstrating a preponderance of evidence, or more evidence than not (EEOC 2000). Initially, the burden of proof rests with the plaintiff who brings forth a *prima facie* violation, which often relies on demonstrating unequal compensation between a male and a female employee who perform equal work or are similarly situated. Then, the burden shifts to the defendant, commonly the organization, who must prove under the EPA that the difference in pay results from one of four affirmative defenses: seniority, merit, quantity or quality of production, or a job factor other than sex, or provide a reasonable explanation for the pay difference under Title VII. Finally, a plaintiff can then assert that pay discrimination has occurred if they can prove that the defense offered by the defendant was only a pretext for discrimination (Gutman et al. 2011). If a plaintiff wins a pay discrimination case, they are entitled to certain remedies that may come in the form of financial awards such as backpay or liquidated damages. To ensure protection for individuals who file pay discrimination claims, retaliation against a plaintiff is illegal.

Although the EPA and Title VII provide a solid platform for individuals to pursue pay equality, such legislation has limitations in that it does not protect all individuals equally. For example, Eisenberg (2010) illustrated that women in high-level positions have had trouble successfully pursuing pay equality cases because filing an equal pay claim typically requires finding a comparator that has performed the same tasks as the plaintiff, and many women in high-level positions cannot identify a male comparator who performs the same work. Eisenberg advocated for the expansion of pay equality legislation to protect individuals who are not currently protected under the EPA and Title VII. Recently, both statewide and federal legislation has increased the equal pay protections of the EPA and Title VII.<sup>2</sup>

<sup>2</sup>Recent legislation has been passed on the state level to increase equal pay protections. Additionally, in 2009, the Lilly Ledbetter Fair Pay Restoration Act amended previous pay discrimination law by stating that pay discrimination occurs each time a paycheck with a discriminatory sum is issued, thereby increasing the opportunities a plaintiff has

## Monitoring Pay Equity

To pursue fair employment practices and compliance with legal standards, organizations can proactively monitor for pay discrimination (Doverspike et al. 2017). Analyses used to evaluate pay equity can become complex, necessitating many organizations to employ external consultants to ensure correct practice and compliance with legal standards.

By statistically analyzing their data using multiple regression, an organization can evaluate if a significant difference in pay exists between men and women after controlling for legitimate factors such as an employee's job group, tenure, performance, and degrees held (Doverspike et al. 2017). If a significant effect of sex remains, then there is evidence that pay discrimination may be present within the organization. Multiple jobs are often aggregated into one regression analysis to increase statistical power; however, it is debated whether and to what extent such aggregation is appropriate. Additionally, the accuracy of these regression analyses is questioned when the sample size is small and legitimate explanatory factors are difficult to identify and quantify.

If an organization uncovers the existence of pay inequity, they should seek to remedy the situation, both to avoid litigation and to mitigate the negative attitudes and behaviors that have been shown to be associated with employee perceptions of distributive injustice (such as unfair pay; Colquitt et al. 2001).

## Approaches for Decreasing Pay Inequity and the Pay Gap

To eradicate existing pay inequity, organizations can take a number of steps, including raising the compensation of the underpaid employee(s) or

to file a complaint (Vodanovich and Rupp 2022). Additionally, the Supreme Court ruled in 2020 that the protected class of "sex" in Title VII includes gay and transgender individuals. Therefore, LGBTQ+ employees are now protected under U.S. legislation from experiencing pay discrimination. Some states have recently allowed broader pay equality protections. In 2018, New Jersey passed a law that allows a comparator to perform similar, rather than equal work, and in Massachusetts the standard is "comparable" work. (Strah et al. 2022).

foregoing awarding bonuses to the overpaid employee(s) (Doverspike et al. 2017). However, ensuring that employees who are performing equal or equivalent work are categorized as performing the same job – a task required before pay equity analyses can be conducted – can be challenging. Strah et al. (2022) describe how job analysis and job classification methods can be used to increase pay equity. Job analyses are used to identify the tasks performed on the job as well as the knowledge, skills, abilities, and other characteristics needed to perform those tasks. Job classification then uses the information from a job analysis to give positions job titles and classifications that can be used to compare various positions. The authors argue that job analysis and job classification should be conducted with the relevant pay discrimination legal standards in mind.

Recent advocacy for pay transparency has been another effort employed to decrease the gender wage gap (Miller 2021). The Society for Human Resource Management (SHRM) notes that 94% of human resource professionals believe it is important for organizations to be transparent about how pay decisions are made. Increased pay transparency can prompt organizations to critically examine the factors that influence their pay decisions for sources of bias that lead to discrimination. Once bias has been identified in the pay decision process, an organization can work to eradicate the bias and develop new, equitable processes.

Addressing variance in the pay gap that is due to factors beyond pay inequality of employees in the same position is more complicated and beyond the scope of this entry. However, the pay equity literature has provided some suggestions – for example, the reconceptualization of skill values that have been gendered. Researchers in New Zealand, who analyzed 4 years of pay data, observed occupational segregation by gender and the different skills used in gendered occupations (Junor et al. 2009). Technical skills were more common in male-dominated occupations, whereas interpersonal skills were prioritized in female-dominated occupations. They found that greater value, and consequently financial

compensation, was placed on technical skills over interpersonal skills, which contributes to a gender wage gap. To combat pay inequity, these researchers created a skills taxonomy to identify important interpersonal skills that have been undervalued in occupations predominantly occupied by women. They argue that naming and organizing undervalued interpersonal skills allows for the recognition of such skills in (mostly female-dominated) occupations.

## Conclusion

Investigating the causes and effects of, and remedies to the gender pay gap provides an understanding of issues surrounding pay equity. The current entry defined and discussed pay inequity in the context of the gender pay gap. It then covered example (US) legislation before discussing methods for monitoring and addressing pay inequity and the gender pay gap.

## Introduction

This entry explores scholarly biases to publication and evaluation in top journals. While peer review is frequently asserted to be “blind” and “a level playing field,” some indications suggest biases occur and may, at times, reflect systemic institutional norms that undermine scientific progress. Based on ongoing research, we discuss some of these barriers that scholars face, particularly issues related to coercive citation, gratuitous reference padding, special editors that may skirt conventions, and other similar biases that impact a meritocratic academy and an objective and impartial advancement of scientific research.

## Measuring Academic Performance

The classical Humboldtian model of higher education is based on essential rules of academic governance including (1) individual autonomy and predominance of the faculty in university affairs, (2) the primacy of basic over applied research, and (3) ideals shared by teachers who pursue research on them despite potential obstacles (Ash 2006). Such setting offers an environment for the development of specific institutional structures that favor academic freedom,

knowledge creation, bonds, and interactions between faculties. This enhances the link between research and teaching where students are viewed as partners in the process. With its undoubted contribution to encouraging research and knowledge creation Humboldtian model of university revealed several shortcomings related to the primacy of faculties as well as the emergence of bureaucracy and rigid structures. Public concerns about the efficiency of funds dedicated to academia as well as the effectiveness of the structures dominated by the seniority-based authority lead to significant reforms of American and Western European entities of higher education followed by Asian and Eastern European universities. Majority of them evolved toward corporate-dominated model that rests of the legacy of modern management. In consequence, universities – similar to other organizations – adopted the system based on classical corporate solutions that include evaluation, management, rewarding, and directing job performance of faculties. Performance measurement systems are designed to ensure university efficiency defined as the relationship between invested funds versus research and teaching results as well as academic excellence understood as the number of top-tier journal publications and citations. These metrics combined with additional measurements on academic mobility, faculty, and student internationalization comprise university rankings which depict the institution quality and position. In the language of Bourdieu's concept of *homo academicus* performance measurement based on quality and impact of academic publications decide about the distribution of power which “is essentially based on academic capital, that is, control over the material, organizational, and social instruments of reproduction of the faculty. On the side of the culturally autonomous disciplines, symbolized by the natural sciences, power is rooted principally in intellectual capital, that is, scientific prestige and capacities as defined strictly by and among peers” (Wacquant 1990:680).

Success in academia is closely tied to success in academic publishing viewed as the “crucial antecedents to meaningful outcomes” (O’Boyle

et al. 2017:377). With the milestone of the seminal work by Gross and Gross (1927) performance of scholars is frequently measured with the number of publications in high impact journals and the metrics that show the citations of these publications. An individual’s publication record drives their success in the job hunt process, access to grants, and obtaining tenure at their institution (Honig et al. 2017; Niles et al. 2020). Different institutions have different expectations regarding the type and amount of academic publications required for tenure. However, it is a universal fact that the majority of academic institutions value publications in peer reviewed, high-tier journals (Honig et al. 2018; Niles et al. 2020).

Further, success in academic publishing is dependent on the acceptance and acknowledgment of one’s work by peers since peer review is considered the most effective and accurate method of advancing scientific knowledge and remains the essential prerequisite to publish research results and obtain research grants. However, contemporary academic publication is a socially constructed enterprise, highly competitive, and susceptible to a number of biases and weaknesses introduced by actors attempting to leverage advantages. Editors, as well, have a vested interest in enhancing the metrics by which journals are evaluated, such as impact factor (e.g., PloS 2006).

Interestingly, meritocracy or the novelty of the research topic is not enough to publish in these journals. This corresponds with Luhmann’s concept of “autopoietic character” of an organization where the reform or implementation of new practices is constrained due to the impact of the existing structures. Numerous studies indicate that the growing competition in science for funding and citations may deform research process and lead to serious side effects. These include blatant scientific misconduct such as fabrication, falsification, and plagiarism and questionable research policies such as post-results hypotheses development, taking undeserved credit for contribution, data trimming, peek-a-boo approach of showing partial results one at a time in separate papers (Bedeian et al. 2010; Chen 2011; O’Boyle

et al. 2017). In addition, authors argue that the academic publication process is often riddled with bias and inconsistency (Honig et al. 2018; Fong and Wilhite 2017). There is growing evidence that researchers abuse the rules of rigor and relevance and engage in alteration of hypotheses to support data (O'Boyle et al. 2017), avoid reporting statistically insignificant results, offer intellectual exhibitionism, bombastic style, tautology, and the illusion of theory development (Tourish 2020). Finally, criticism of peer review process (Chen 2011) emphasizes the concerns on its "impartiality, reliability and validity" (Bedeian 2004:199) that undermine assessment of a paper's scientific merit. The concept of peer review forces the compromise between the author and reviewers leading to the so-called socially constructed knowledge (Bedeian 2004). The unpredictability of editors' decision and publishing success being the function of the assigned reviewers leads to the abuse of the initial idea that assumed dissemination of new knowledge with the serious risk of the system failure (Edwards and Roy 2017).

This entry focuses on two important issues related to the quality and accuracy of the peer review and journal ranking processes. First, the significance of social ties between authors and editors of special issue and conventional issue journals. Research shows a significant amount of relationship overlap between authors and editors of special issues which indicates presence of a network effect in the review and publication process. Second, this entry considers the implications in the monotonic growth of the number of references over time in academic journals with the simultaneous growth in journal impact factor (IF). This correlation suggests that one response to the overall increase in the importance of IF are gratuitous citations that serve to inflate scholarly impact throughout their fields and disciplines. Both of these perspectives highlight the limitations and possible insertion of relational processes interfering with the accuracy of scientific study, evaluation, and reporting.

The social and work relationships between the editors and the authors of special issues versus

conventional issues of management journals play a significant role in publication. According to the social network theory, individuals who share similar attributes such as age, gender, political affiliation, and so on are more likely to develop social network ties than individuals with different attributes. These social ties are quite relevant in explaining individual behaviors and outcomes because they provide the means by which individuals gain access to information, resources, and ideas (Knoke and Yang 2008). In the context of academic publication, social ties among editors and authors can provide additional avenues for mentoring, information exchange, and opportunities for publication. Examples of social and work relationships in our research include current or previous work at the same institution, current or previous education at the same institution, joint publications, and current or former relationships as a faculty member and a student. In addition to conventional issues, research examined special issues because majority of these special issues are guest edited and the guest editor and/or subject matter expert has considerable liberty in inviting authors who have previously published on the special issue topic or invite authors who belong to their social network. Commensurate with the freedom given to these guest editors, this research examined the percentage of relationship overlaps between authors and editors, predicting it is significantly higher for special issues. Preliminary results from 60 special issues in three prominent management journals support this contention. For instance, 156 out of 633 or 33% of special issue authors had previous publications with the editors. Furthermore, 179 out of 644 or 38% of special issue authors had a work or an education overlap with the editor. These research findings highlight the role of social ties in academic research and question the integrity and objectivity of the publication process. They highlight the need for publication policies aimed at reducing such biases, increasing transparency in the publication process, and adoption of standards that help to enhance the rigor of scientific research.

Another relevant factor is research examining data on impact factor and the number of

references and citations to better understand journal IF strategy (Aluchna and Honig 2021). Specifically, leading management journals organized within the structure of Academy of Management (AOM) were analyzed during two time periods – 1997–2005 and 2006–2019. It was found that the past 10 years reveal a very different record of IF, references, and citations dynamics than the 10 years preceding. Specifically, the results showed that the number of references cited in the average AOM journal publication has increased during the past decade by 50% compared to the decade before, growing from 63 per article to over 90. This research also noted a significant increase of self-citation and cross-citations during the past decade as compared to the decade before. Self-citation increased from an average of 5.7 per article to 7.7 per article during the past 10 years, whereas cross-citation that referenced other AOM journals has also increased, from an average of 4.6 to 6.3. Further, research examined the tendency for journals to cite each other within small families of journals also finding significant relationships.

Existing evidence about the prevalence of misconduct in the peer review and journal ranking process suggests that authors and journal editors need to pay attention to these issues. Given the nature of measurement of academic work and the growing competition among the faculty members to publish in top-tier outlets, the results of recent scholarly research lay ground for discussion on the risk of “gaming the system” including increases in social tie publications, references, gratuitous referencing, and the formation of citation cartels. Note that while some citation indexes account for (and reduce) due to self-citation, not all of them reduce impact factor for self-citation, and it can be difficult to identify which indexes do so. Others offer two impact factors – one reduced by self-citation, and another one without the reduction. Rarely are these differences noted when presenting these statistics. COPE guidelines ask reviewers not to refer to their own research, although in practice this may be overlooked, as both associate editors and reviewers are volunteers who may have limited time to ensure

compliance. Editors and editorial boards who are considered as gatekeepers of academic journals must prevent such gaming of the publication process and strive to maintain the integrity of academic research. Moreover, faculty members can and should play a significant role in establishing performance metrics that disincentivize unethical research behaviors. Overall this research raises concern regarding the side effects of a goal-setting and performance measurement approach to contemporary academic life (Ordnóñez et al. 2008; Murphy 2018).

## Synonyms

Personalist ethics; Person-centered ethics; Person-centered philosophy

## Definition

Personalism refers to a set of philosophical currents developed in the twentieth century facing the depersonalization of some precedent philosophical approaches and ideologies, such as radical individualism and collectivism. Personalism is structured around the centrality of the person, considering his or her individual and social dimensions. Some streams of Personalism also include the transcendent dimension. Underlying Personalism there is an elaborate philosophical anthropology of the person, which also supports Personalistic Ethics. This latter emphasizes the primacy of the person over things, human dignity, and the personal calling to human development, which is not independent of an effective concern for others.

## Description

Personalism refers to a set of philosophical currents born in the twentieth century and structured around the concept of the person.

There are several relevant currents of personalism, including communitarian personalism (Mounier), Anglo-American personalism (Bowne and others), phenomenological personalism (Scheler, Von Hildebrand, Stein), classical ontological personalism (Maritain), and modern

ontological personalism (Wojtyła, Crosby, Burgos).

Most authors within personalism assume a modern concept of the person which is much more elaborated than the old ontological definition where the person is considered as a rational subject. The modern conception entails a rich anthropological perspective as we will discuss below.

Social and political theory and applied ethics can take personalism as a philosophical base. Personalist ethics, often related to personalism, presents a wide range of understandings; however, authors of personalist ethics generally agree that the human person is central and foundational for ethics. The norms for making true moral judgments are grounded in being a person endowed with intrinsic dignity.

## Historical Overview

In a broad sense, personalism has a story as long as that of the concept of the person, a notion created by Christianity in its first theological developments. However, the standard position is that personalism, as a philosophical current, was born in the twentieth century through the work of Borden Parker Bowne (1847–1910) in the USA and Emmanuel Mounier (1905–1950) in Europe. Both thinkers developed the first theories of personalism – though with different theoretical backgrounds. Bowne had philosophical followers and also influenced civil rights activists such as Martin Luther King, Jr. Mounier was very successful in creating a strong social and intellectual movement in Europe, which had great influence in events as the Universal Declaration of Human Rights or the building of the European Constitutions after World War II.

This initial social movement has evolved to a solid philosophical position, thanks to the contribution of a very important group of thinkers like Jacques Maritain, Maurice Nédoncelle, Max Scheler, Dietrich von Hildebrand, Edith Stein, Martin Buber, Karol Wojtyła, Romano Guardini, Gabriel Marcel, Julián Marías, and Xabier Zubiri,

among others. Most of these have a coherent approach to ethics.

## Main Thesis of Personalism

Although personalism includes different sensibilities and approaches, some common elements can be found in all of them (Burgos 2017a):

- (a) *The structural centrality of the person* is the key feature of personalism and this means not only that it values the person or takes the person into account in one way or another in its anthropology, but that the concept of the person is the key to or hinge of anthropology and ethics. One important consequence of this assumption is that anthropology has to work with personalist categories, that is, categories exclusive to the human person, which adequately reflect the features which univocally characterize the person.
- (b) *Calling each person to transform the society.* Every human being is called, by means of his or her action, to influence and modify the world which surrounds them, and can achieve this with particular efficacy through those instruments he or she masters especially well. For the philosopher, those instruments are the theoretical constructions which he or she can evaluate, analyze, or create. Personalist thinkers have shared this way of understanding philosophy and, in general, have tried to transform society in accordance with the personalist way of thinking and avoid an exclusively academic philosophical approach.
- (c) *Turn from a “what” to a “who.”* Personalism maintains that every individual has something special that makes him or her unique, which means, in another words, that he or she is not a “what” but a “who” (Spaemann 2006). This intellectual process which has transformed the anonymous rationalist subject into a singular and unrepeatable person, and converted a “what” with a human nature into a personal

and irreducible “who,” has been described as the personalist turn of contemporary philosophy.

- (d) *The “three-dimensional” structure of the person.* Personalism distinguishes three levels in the person: the somatic, the psychological, and the spiritual. This approach achieves two very important objectives. It avoids any possible operative dualism (which could appear from dividing man into body and soul), and it opens up a more sophisticated anthropological structure which permits a more detailed and complete analysis of psychological, emotional, and experiential dimensions in the person.
- (e) *Endowment of affectivity and subjectivity.* Affectivity is understood by personalism as a basic anthropological category. Feeling is neither knowing nor wanting. It is an original anthropological dimension that extends to the threefold structure of the person: body, psyche, and spirit. There is a bodily affectivity – the way in which we feel the body; there is a psychological affectivity, the emotions, and there is a spiritual affectivity which, in addition, gives account of some of our most profound personal experiences, the relations of affection and of love with our loved ones.

Affectivity is framed in the context of subjectivity and consciousness. To experience oneself, to have a unique and unrepeatable personal world, is an essential feature of the human being which, in addition, is exactly what makes him or her a “who.” Attention to subjectivity is, therefore, wholly decisive in the construction of a personalist anthropology, since if there is no subjectivity there is no subject and thus no person.

- (f) *Interpersonality.* This refers to interactions between persons and the subsequent relationship established. The person is born of a relationship between two parents and, just after being born, establishes with them – especially with the mother, even in the womb – a very intense bond which decisively affects his or her future. Likewise, relations with friends, education, and culture

influence the construction of his or her identity. Personalism stresses the relevance of interpersonal in the construction of the personal identity.

- (g) *The primacy of action and praxis over the intellect.* Personalism emphasizes the relevance of will, action, and praxis trying to overcome the primacy of intellect in some philosophical currents linked to Aristotle. Will, taken to be self-determining freedom, is, from this perspective, ontologically superior to purely intellectual activity. In doing so, the practical aspect, praxis in its multiple dimensions, becomes decisive in as much as it is the medium in which the person expresses and transforms him- or herself. This orientation has made it possible to tackle many important anthropological aspects like work, economics, social philosophy, and politics in a correct way.
- (h) *Corporeality of the person and the distinction between male and female.* Corporeality appears in personalism as a personal reality, that is, as the overcoming of a merely biological vision of the body on which the spirit would exert influence. The body is the somatic dimension of the person, and, in this sense, it is inseparable from him or her. There is not a body without a person. Going further, sexuality can then be understood, as Marías and Wojtyła did, as a particular dimension of being a person, rooted in biology, but transcending it and affecting the very constitution of the subject. The person, in effect, not only has a masculine or feminine biology but is man or woman and is a masculine person or a feminine person, because having a sexual identity affects, configures, and modulates all human structures before birth, as neurology is currently demonstrating (Ruigrok et al. 2014).
- (i) *Communitarian dimension of the person.* Personalism anchors itself between the extremes of liberal individualism and the collectivism, with the objective of avoiding both the risk of making the individual a mere appendix of the social body (collectivism) and that of making him or her

an active and relevant being but lacking in solidarity and seeking only personal good, disinterested in his or her fellow citizens (individualism).

- (j) *Openness to transcendence.* The perfection of the person contrasts paradoxically with the prominence of his or her limits, with illness, finitude, and ignorance. The human mind is faced with questions which it cannot resolve by its own means: the ultimate meaning of life, the justification of the existence of suffering, the meaning of death and the mystery of the hereafter, and the identity of God. These ultimate questions, as well as the very structure of the person, which the person does not produce alone but finds in his or her own being, postulate for personalists the existence of a superior Being who gives reason to human nature and an answer of those ultimate questions of the human existence.
- (k) *Ethics focuses on the person.* This considers the dignity of the person, the primacy of the person over things, and the human development of each person.

## Personalistic Ethics

The starting point of personalistic ethics is a deep reflection on the intimate meaning of human existence, including the uniqueness of each person, and on the interpersonal relations, being conscious of the human dignity, going beyond any specific religious perspective, and invoking human reason. In spite of their diversity, personalistic ethics thinkers generally emphasize that the person internally experiences the reality of the wrong and the good as a kind of act that builds the persons or harms him or her.

In a broad sense, some classic thinkers can be considered as personalistic ethicists. Thus, Aquinas defined the person as a rational subject – and developed an ethical system around virtues, rooted in human nature, which improve the person as a human being. Kant held that no person should be treated merely as a means to an end, but only as an end.

In the twentieth century, personalistic ethics can be found, for instance, in dialogical philosophy and existentialism (Martin Buber, Gabriel Marcel, and others), who generally emphasize the role of one's own personal conscience in determining the moral rightness of an action. It can be found also in some way in phenomenological personalism, which focuses on phenomenological analyses of ethics and on a subjective axiology, which, nevertheless, depends on an objective ontology (Max Scheler and Dietrich von Hildebrand). An original proposal, which can also be included within personalist ethics, is that of Emmanuel Levinas, through what he termed *the ethics of the Other*. According to Levinas, the face of the Other comes toward me with an infinite sense of responsibility. Ontological personalism (Maritain) strongly defends a natural moral law ethics as the philosophical basis for human rights, personal virtues, and common good defined in terms of proper human ends. Modern ontological personalism seeks the foundations of ethics in the structure of human person, essentially equal for all human beings. The whole person, including his or her relational and social aspects, and what contributes to fulfilling human beings as persons, is the criterion for establishing the goodness of an action and vice-versa. This approach connects the centrality of the person with principles and virtues through the personalistic principle and the common good principle (Melé 2009) and can be applied to professional, economic, and business ethics.

According with the personalistic principle “No human being should ever be treated as mere means to an end. On the contrary, persons should be treated with respect and also with benevolence and care.” The common good principle has been formulated as: “In acting within a community, persons and social groups have to subordinate their own interests in all that is indispensable for the realization of the common good, and contribute in accordance with the needs of such a community and their respective capacities to the common good of the community.” (Melé 2009).

Ontological personalism, both classical and modern, has been suggested for bioethics

(Sgreccia 2012), business management (Alford 2010, Acevedo 2012; Melé 2009), and leadership, as theoretical support of “servant leadership” (Whetstone 2002).

Regarding the economic system, it has been argued that personalism can provide new directions to economics (Gronbacher 1998), overcoming the *homo oeconomicus* model, dominant in many economic and managerial theories (Melé and Canton 2014). The “civil economy,” which has now been rehabilitated (Bruni and Zamagni 2007; Zamagni 2012), can also be considered as personalist, since it is based on persons and their relationships – particularly the principle of reciprocity – values community, and pursues the common good. It also emphasizes the principle of exchange of equivalents and the principle of redistribution.

Personalistic ecologism (Ballesteros 1996) sees the human being as a personal body, dependent on the rest of nature and at the same time endowed with a particular dignity that makes it possible to take care of the rest of creation, as well as giving primacy to the problem of their living conditions, and obliges this. This contrasts with both dominative anthropocentrism and biocentrism and even more with eco-centrism.

In recent years, certain progress has been made on personalism and personalist ethics, principally in Europe and Latin America. Additionally, Catholic social thought incorporates some elements of this stream of thought, particularly that developed by John Paul II (Karol Wojtyła).

Although personalism is not mainstream in applied ethics, some of its key elements such as human dignity and the centrality of the person are shared by many around the world.

## Person–Organization Fit

Corine Boon  
Amsterdam Business School, University of  
Amsterdam, Amsterdam, The Netherlands

### Synonyms

Person-organization value congruence; Value congruence

### Definition

PO fit is defined as “the compatibility between people and organizations that occurs when: (a) at least one entity provides what the other needs, or (b) they share similar fundamental characteristics,

or (c) both” (Kristof 1996, p. 4–5). The definition highlights two important conceptualizations of PO fit: supplementary fit and complementary fit. Supplementary fit refers to similarity of important characteristics of persons and organizations, whereas complementary fit occurs when persons and organizations complement each other or “when a person’s characteristics “make whole” the environment or add to it what is missing” (Kristof 1996, p. 3).

## Description of Person–Organization Fit

Although research on PO fit has a long history (Kristof-Brown et al. 2005), it has received growing attention since the 1980s. PO fit is seen as important as it is relevant in each phase of the employment relationship, from entry to long-term employment at a certain company. The attraction–selection–attrition (ASA) framework (Schneider 1987), an important model underlying the PO fit literature, underlines this. The ASA framework argues that organizational characteristics *attract* certain people which share these characteristics; people who share these characteristics are more likely to be *selected* by the organization and are more likely to stay with the organization (i.e., *attrition*). A consequence of this ASA cycle is that over time, organizations become more homogeneous as more people that share its characteristics enter and stay in the organization (Schneider 1987).

Over the years, the most common conceptualization of PO fit has been supplementary fit, with a focus on similarity of personal and organizational characteristics (Kristof-Brown et al. 2005). Although it is possible to achieve a supplementary fit on several characteristics, such as values, needs, goals, or personality, the most commonly used operationalization in empirical studies is value congruence (Kristof-Brown et al. 2005). Several meta-analyses have shown that PO fit conceptualized as value congruence is positively related to a range of attitudinal and behavioral outcomes, such as organizational commitment, satisfaction, task and contextual performance, and turnover (e.g., Kristof-Brown et al. 2005).

There are two different ways of measuring PO fit. First, you can examine “actual fit” of a commensurate set of personal and organizational values and calculate a score for value congruence (Kristof-Brown et al. 2005). For example, organizations may ask job applicants during the selection procedure to fill in a value questionnaire to assess their personal values, and a fit score can be calculated when comparing this value profile of the applicant with the value profile of the organization. Here, a set of values which is important to the organization can be selected. A second way of measuring PO fit is to measure “perceived fit” or subjective perceptions of value congruence (Kristof-Brown et al. 2005), for example, by directly asking people about their fit with the organization. Using this method, no specific values are focused upon; however, employees assess for themselves the extent to which they feel they fit with the values of the organization. The assessment of PO fit happens in the heads of the employees rather than through calculation. Both actual and perceived fit have been shown to be related to positive outcomes, albeit stronger relationships are found for subjective perceptions of fit (Kristof-Brown et al. 2005).

### Person–Organization Fit and Ethical Values

When studying organizational values, a choice needs to be made regarding which values to focus on. Many studies use a broad set of work-related values, and some focus on one specific value domain, such as ethical values. Ethical values can be considered as a subset of an organizational culture or set of values (Treviño 1986). They have an impact on individuals’ moral reasoning, as a guide to judging which behaviors are right or wrong (Ambrose et al. 2008). Ethical values are seen as an important value domain, as people tend to strongly feel about these values and they are likely to guide employees’ ethical and unethical behaviors (Treviño 1986). Therefore, in choosing an organization to work for, an organization’s ethical values are an important factor that people take into consideration. Indeed,

organizations with ethical cultures – in which managers behave ethically, and unethical behaviors are not being tolerated – attract and retain employees because they are perceived as responsible, fair, and just organizations that find it important to build relationships with employees (Ruiz-Palomino et al. 2012). In line with this, research has shown that employees who work in organizations with ethical values feel they fit better in the organization (i.e., they have higher perceptions of PO fit) (e.g., Andrews et al. 2011; Ruiz-Palomino et al. 2012). This suggests that when measuring subjective perceptions of PO fit, employees tend to include ethical values in their overall assessment of whether they feel they fit in the organization.

Besides the effects of ethical culture on general perceptions of PO fit (i.e., not specifically focused on ethical values), other studies have focused on “ethical PO fit.” Ethical fit is defined as the congruence between individual and organizational ethical values and can thus be regarded as a specific – ethics focused – form of PO fit. Most of the studies on ethical fit have conceptualized ethical fit as “actual fit”; they use the five types of ethical climate as distinguished by Victor and Cullen (1988) – instrumental, caring, law and code, rules, and independence – to calculate a match between employees’ ethical climate preferences and the ethical climate present in the organization. An instrumental climate is characterized by self-serving behavior of employees, and a caring climate reflects a concern for the welfare of both the employee and the organization. A law and code climate is characterized by compliance to a code of ethics, a rule-oriented climate is oriented toward compliance at the level of the firm, and the independence climate is focused on employees’ personal values and ethics (Victor and Cullen 1988). Studies have shown that employees who work in organizations with an ethical climate which matches their preferences, are more satisfied, more committed, and show lower turnover intentions (Ambrose et al. 2008). This positive effect of ethical PO fit is stronger for people who are more sensitive to ethical issues, as for them achieving an ethical PO fit is likely to be more important (Andrews et al. 2011).

Overall, this suggests that the ASA framework also holds for ethical values; people are attracted and selected into organizations with ethical values and employees who remain in the organization experience higher PO fit. Also, ethical PO fit is related to positive attitudes and to the intent to stay in the organization. Achieving an ethical PO fit is particularly important for people who find ethical issues important. Thus, for organizations with ethical values, selecting employees based on a combination of a fit with their ethical values and their sensitivity to ethical issues is an important way of enhancing employee satisfaction, commitment, and retention.

## Piketty and Wealth Taxes

Alex C. Michalos

University of Northern British Columbia, Ottawa, ON, Canada

## Synonyms

Annual net taxes on financial and/or nonfinancial assets; Annual tax on net wealth; Progressive tax on personal wealth

## Introduction

This entry examines issues related to the definition, assessment and deployment of an annual progressive tax on corporate and individual financial (e.g., stocks, bonds, insurance, bank deposits) and nonfinancial (e.g., real estate, art, literature) assets or wealth.

## Description

Thanks to the brilliant treatise by Piketty (2014), wealth is beginning to get the attention it deserves as an important determinant of the quality of people's lives. Following Piketty, I use the terms “wealth” and “capital” “interchangeably, as if they were perfectly synonymous,” allowing that alternative views are also workable. For our purposes, the following sketch of certain aspects of his research will suffice. “National wealth” may be defined as “the total market value of everything owned by the residents and government of a given country at a given point in time, provided it can be traded on some market. It consists of the sum total of nonfinancial. . .and financial assets.” Within the class of national wealth, we may distinguish private from public assets and liabilities, i.e., private and public wealth. In all countries, public wealth is always very small compared to private wealth, e.g., “private wealth in 2010 accounts for. . .more than 99 percent in Britain and roughly 95 percent in France.” Within the class of private wealth,

there is again generally a huge difference between what is owned by the top 10% of wealth-holders and what is owned by everyone else, e.g., “in the early 2010s, the richest 10 percent own around 60 percent of the national wealth in most European countries. In the United States, . . . the top decile own 72 percent of America’s wealth, while the bottom half claim just 2 percent.” (Piketty 2014, pp. 48, 125, 257–8).

Piketty’s primary message is boldly stated. “The central thesis of this book is precisely that an apparently small gap between the return on capital and the rate of growth can in the long run have powerful and destabilizing effects on the structure and dynamics of social inequality” (Piketty 2014, p. 77). What’s more, as Boushey et al. (2017, p. 14) wrote: “An unequal economy is one that is lousy at turning productive potential into societal well-being.” Although the historical record is, to say the least, extremely rough, on Piketty’s reckoning, from 1000 to 2012 “the rate of return to capital (pretax) has always been higher than the world growth rate.” In fact, he claims that “the annual growth rate from antiquity to the seventeenth century never exceeded 0.1–0.2 percent for long” and the average per capita output growth rate from 1700 to 2012 was 0.8%, while “there appears never to have been a society in which the rate of return on capital fell naturally and persistently to less than 2–3 percent, and the mean return we generally see (averaging over all types of investments) is generally closer to 4–5 percent (before taxes)” (Piketty 2014, pp. 352–358). The result of these different historical rates of change is that “the distribution of capital ownership (and of income from capital) is always more concentrated than the distribution of income from labor. . . in all countries in all periods for which data are available, without exception. . . [and]. . . the upper 10 percent of the labor income distribution generally receives 25–30 percent of total labor income, whereas the top 10 percent of capital income distribution always owns more than 50 percent of all wealth (and in some societies as much as 90 percent)” (Piketty 2014, p. 244).

The persistent inequality just sketched partly explains the failure of the French revolution,

reminds us that in Irving Fisher’s 1919 presidential address to the American Economic Association he expressed the view that “the increasing concentration of wealth was the nation’s foremost economic problem,” and suggests that Emile Durkheim’s 1893 prediction that in time inheritance taxes would ensure “that ownership of property ended at death” is still unconfirmed (Piketty 2014, pp. 365, 422, 506). Piketty spends two chapters (of 16) making the case for a “progressive global tax on capital, coupled with a very high level of international financial transparency. . . [as]. . . a way to avoid an endless inegalitarian spiral and to control the worrisome dynamics of global capital concentration,” allowing that such a tax is for now, at least, “a utopian idea” (Piketty 2014, p. 515). He is not the only scholar to look beyond the immediately impossible to the maybe sometime possible (Michalos 1988; Atkinson 2015; Zucman 2015; Krugman 2017; Boushey 2017).

Michalos (1988) provides some historical background information on wealth taxation across the globe, including a review of 19 arguments used by proponents and 31 critiques of arguments used by opponents of such taxation. He did not have access to Piketty’s extensive historical trend data. Examples of proponents’ arguments include

1. Net wealth is the best measure of an individual’s ability to pay taxes. . . 5. The current unequal distribution of net wealth contributes to the unequal distribution in incomes. . . 6. The unequal distribution of net wealth prevents the equalization of opportunities for employment and other necessities of a good life. . . 10. Unlike significantly progressive income taxes which perpetuate current concentrations of wealth by preventing new accumulations, a progressive net wealth tax would reduce the size of and even eliminate some current concentrations. . . (Michalos 1988, pp. 12–13).

Examples of critiques of opponents’ arguments include

20. Insofar as equality of opportunity is an aim of a net wealth tax, that aim can be better served by improvements in the education system and by the elimination of social discrimination. . . Reply. (1) Several studies have shown that disparities in income and wealth cannot be accounted for by disparities in educational achievement. (2) Great disparities in wealth are at least as much and

probably more the cause than the effect of social discrimination. . . (3) All three problems of wealth disparities, inadequate education and social discrimination merit attention. . . (Michalos 1988, p. 22).

Although Piketty spends more time on issues related to global wealth taxation than on anything else as a direct means of arresting the growth of wealth and income inequalities, throughout his book he recognizes the multidimensional nature of wealth and income, and their variety of determinants offering additional opportunities for remedial intervention. A good summary of his views appears in Piketty (2017, pp. 545–547), partly drawn from Piketty (2014).

One should be wary of any economic determinism in regard to inequalities of wealth and income. The history of the distribution of wealth has always been deeply political, and it cannot be reduced to purely economic mechanisms. . . . The history of inequality is shaped by the way economic, social, and political actors view what is just and what is not, as well as by the relative powers of those actors and the collective choices that result. . . . A large number of other public and sociopolitical institutions also play an important role. These include: the development of the social state in the broad sense; monetary regimes, central banks, and inflation; labor legislation, the minimum wage, and collective bargaining; nationalization, expropriation, and privatization; slavery and forced labor; corporate governance and the rights of salaried workers; the regulation of rent and other forms of control over prices and usurious interest rates; financial deregulation and the flow of capital; commercial and migratory policies; inheritance regulations and property regimes; demographic and familial policies; and so on.

Other authors in the Boushey et al. (2017) volume provide more suggestions, especially more or less indirect strategies for decreasing inequalities. For example, Naidu (2017) recommends “robust anti-trust commitment, eliminating barriers to entry and mobility. . . public sources of investment (such as housing). . . [and] a financial transactions tax” (See also Michalos 1997); Solow (2017) suggests “a more steeply progressive income tax”; Nielsen (2017) suggests “Investing in the human capital of young children. . . early home environments, and even prenatal health and nutrition”; Tyson and Spence (2017) suggest “increasing the marginal income tax rate for top earners,” although

they are short on what to do about the inequality effects brought on by the computer/digital revolution, “imperfect competition, first-mover advantages, market power in networked systems, and the wages and livelihoods of workers who perform tasks and have jobs that can be better performed by machines at lower cost”; Milanovic (2017) suggests making greater use of Employee Stock Ownership; Lakner (2017) suggests raising tax rates on capital incomes up to those of labor incomes, raising relatively low property taxes, challenging tax havens, redistribution through cash transfers, improvements in educational opportunities, sharing benefits of automation with workers; Boushey (2017) suggests giving greater support for “women’s economic independence” by “ensuring equal access to and economic and political rights for men and women – and for those with and without caregiving responsibilities”; Steinbaum (2017) suggests that “the decline and fall of an ideology is what precipitated the egalitarian era of the mid-twentieth century”, rather than the wars and depression, and therefore remediation of current inequalities will require the election of a “working-class, left-wing coalition” with a suitably powerful ideology; Grewal (2017) suggests reforming judicial systems “that offer special protections to asset-holders; Derenoncourt (2017) suggests improvements in the collection and analysis of administrative statistics, and the provision of reparations for subjects of formally colonized countries; Jacobs (2017) suggests facilitating change through greater attention to and use of institutions like legal structures, informal rules, common knowledge, history and culture, and reminds us that “The aim is to build countervailing political power such that political equity in turn makes possible reforms to unravel the pernicious economic inequality detailed by Piketty in *Capital*.” (Adapted from Michalos (1988) and Michalos and Hatch (2019)).

## Plagiarism and Text Recycling (Self-Plagiarism)

Charon A. Pierson  
Committee on Publication Ethics,  
Gilbert, AZ, USA

## Synonyms

Mosaic plagiarism; Patchwork plagiarism; Self-plagiarism; Verbatim plagiarism

## Definition

Plagiarism is defined as “taking, using, presenting others’ ideas, data, results, writings and inventions without giving due or appropriate credit

to the originator” (COPE Taxonomy 2013). The practice is commonly perceived as fraud. Plagiarism is derived from the Latin *plagiarius* and the Greek *plagion*, meaning kidnapping or kidnapper. Self-plagiarism or text recycling is defined as, “. . . sections of the same text appear (usually un-attributed) in more than one of an author’s own publications” (BioMed Central and COPE 2016). Whether presenting another’s ideas as one’s own, or presenting one’s own ideas as new material, publishers and editors of scholarly works consider both practices unethical. Plagiarism as ethical misconduct does not require a legal copyright violation; however, copyright violations can occur in conjunction with acts of plagiarism.

## What Are the Issues?

Plagiarism and text recycling in published articles and books can lead to legal issues and reputational risk for authors, journals, and publishers. In some situations, plagiarism can affect public understanding of the magnitude of a problem, particularly in biomedical research where publication of duplicate data distorts the outcomes of clinical trials of drugs and devices. Legal issues arise when copyrights are violated. Mastery of a field of knowledge, which is a requirement for higher educational degrees, cannot be demonstrated when students plagiarize the work of others or recycle their own work in their final educational products for a degree. Uncovering plagiarism is not always a simple task.

*Issues in scholarly publication.* Journal editors and publishers strive to present original and cutting-edge work to their readers. Authors are usually required to attest that the paper they submit to a journal is original, has not been previously published and is not under consideration by other journals. When a published paper is found to be plagiarized from another source or the data have been previously published, readers are cheated of new knowledge and the scholarly record is distorted. Editors correct the distortion by issuing a correction (corrigendum) to the article explaining the misconduct, or in some cases

retracting the article entirely if a correction is insufficient. Post-publication corrections are electronically attached to the article, but journals that appear in print will not have a printed correction in a timely manner. The need for corrections and retractions often take months or even years to be recognized and published.

Verbatim plagiarism is more easily detected with specialized computer programs designed to compare text from a submitted paper with text from other published sources. The comparison results in a similarity score (i.e., the percentage of identical text in the submitted paper with other sources). What is not included is any recognition of plagiarized ideas. In the pre-publication stage, editors rely on peer reviewers, experts in the field who know the evolution of the major ideas within the discipline, to detect missing or inadequate attribution of credit for ideas in a manuscript. Quotation marks around identical text along with an appropriate citation for the material attributes both the idea and the expression of the idea to the originator. Paraphrased ideas must also be properly cited to avoid the impression that the material is new, although quotation marks are not required if the expression of the idea is new. Post-publication, journal readers sometimes discover plagiarism of either ideas or text and report it to the editors. Translations of works from another language without any attribution to the original author are often discovered in this manner. Plagiarism detection software does not detect translation of previously published works from one language to another.

Editors alert readers to the misconduct based on the extent and location of overlap. Extensive overlap, bordering on duplicate publication, requires consideration of a retraction. If the plagiarism is discovered upon submission of a manuscript, it may be grounds for immediate rejection of the submission and notification of a research integrity officer or supervisor of the department of origin of the authors. It is the obligation of publishers to protect the copyrights of their authors, journals, and other intellectual property. Violation of a copyright may be grounds for legal action on the part of any aggrieved party. There are many cases on the COPE website

(<https://publicationethics.org/cases>) describing actions taken by editors and publishers to address plagiarism and text recycling. Key factors in the decision include the type of article (research vs. review), known copyright issues, and duplication of data.

*Impact on public health.* Public health decisions, including selection of appropriate treatment regimens for various conditions, are best made on the extant scientific evidence. Although scientific evidence is rarely conclusive, multiple studies on a single topic offer the best chance at determining the best evidence on which to base a clinical decision. When multiple studies have been done on a drug or device, it is common to aggregate the findings in a systematic review and meta-analysis of outcomes; to be of value, such a review is done with a rigid protocol to assure homogeneity of the studies. When data have been plagiarized and are counted in a systematic review as more than one study, the meta-analysis may be distorted. Meta-analysis is a statistical technique developed to quantitatively estimate the effect sizes of clinical interventions. This pooled analysis when done correctly can provide a more reliable estimate of true effect sizes for drugs, devices, or interventions. If the same subjects are counted multiple times in the pooled sample, the results will be inaccurate.
